sion being the graduating of the normal class of the high school.

Executive Committee Appointed.

The chairman-manager of the next chrysanthemum show has appointed his staff to act with him as the executive committee as follows: Emil Schray, chairman of the committee on premiums and awards; William C. Young, subscriptions and special prizes; C. C. Sanders, finance; Carl Beyer, advertising; Robert F. Tesson, printing and hall, and Frank Fillmore, delivering of special prizes. The executive committee will meet on next Saturday night to work on the preliminary list and also name the men selected to act with them as a committee. The committee on smoker reports that those members who wish to attend and have not yet subscribed will please send their names to the secretary at once.

Program for Next Meeting.

The following essays will be read at the next regular meeting of the Florists' Club, February 10, at 3 p. m.; "What are the requirements of a new carnation to entitle it to a certificate of merit from the St. Louis Florists' Club?" by Robert F. Tesson. "Name one pink, one white and one red carnation as being the best commercial variety, and state why you think them the best," by John Steidle. "What variety of roses would you grow to supply the St. Louis market?" by J. F. Ammann. "What kind of fertilizer would you use for carnations, and in what form?" by H. G. Ude. "How to grow mignonette," by Andrew Meyer, Sr. "What should the growers do to assist the commission men in getting better prices for their consignments?" by Charles A. Kuehn. "What palms would you advise an amateur to grow, giving him, say, five or six varieties?" by Julius Konig, Sr. "What variety of violet would you grow in a profitable way in and out of doors?" by F. W. Ude, Jr.

Various Notes.

Visitors in town last week were Dan MacRorie, representing W. A. Manda, Orange, N. J. Dan is looking the picture of health and reports trade good. The other was Mr. Brown, of Brown & Canfield, Springfield, Ill.

Tom Carroll lost 1,000 feet of glass by last Tuesday's wind storm.

Fred Foster, who was secretary and treasurer, and also manager of the Krebs Floral Company, is no longer connected with the above firm.

The last four games of the cocked hat series were rolled Monday night, with E. Schray high man with 134; Kunz, second, with 119; Kuehn, third, with 117. Schray's single high score was 47. The champion cocked hat bowler of the series is Kunz, with 492; Kuehn, second, with 465; Beneke, third, with 454. The highest single score during the series was by C. Beyer, with 52; Kunz, second, with 48; Schray, third, with 47. Next Monday night we go back to the old game.

COPYRIGHT 1898.

NEW YORK.

Around the Marts.

Violets? Take 'em by the ton!
Blizzards? We can give you one!
Summer weather? Here's a slice!
Springtime—autumn, in a trice!
It's the snowflake or the rose—
Everything in weather goes!

The above clipping from the Atlanta Constitution about fits the New York situation, that is, in regard to violets and weather—mostly weather! It has been snowing the last twenty-four hours, and the "beautiful" is piling up in great shape. It is better, though, than rain. Business is as good if not better than at any time this winter.

Stock is scarce when applied to roses and prices for the real fancy stock should satisfy the most fastidious grower, but then everybody does not grow fancy stock and all are not fastidious. After all, it is the great law of supply and demand, and until congress repeals it I suppose it will always be so.

Beauties, Bridesmaids and Meteors are still the leaders. Beauties, the finest, realize 75 cents, while extra Maids sell for $12, fancy $15, and a few extra specials at $20; Meteors and Testouts, special, $15; Brides, $10, $12, $15 for high grade and specials; Morgans and Cusins, $10 and $12 for extras and specials.

There have been a few slight changes in the regular market report, but these are chiefly confined to roses. Valley dropped another peg. Violets held their own at 40 to 75 cents, according to stock. There is a tremendous amount coming in daily and they get cleared up pretty clean, as is all classes of goods, which is saying a whole "bunch."

Mr. Walter F. Sheridan is handling some of the finest carnations—Frank Nequet's "Maud Adams," the variety that created such a sensation at the last meeting of the New York Florists' Club, C. Besold's "Frances Joost," and others, besides a regular line. Mr. Sheridan receives some excellent lilac, both varieties.

Mr. A. Herrington is shipping in some especially fine cattleyas, large, well developed flowers of exceptional color, but then what else could be expected from Florham Farms, the home of the great new chrysanthemum (if it were a poor variety I would say "mum") Frank Hardy. However, it speaks for itself, and speaks loud, too.

Our Special Correspondent's Report.

The improvement noted in last week's issue continues and a general clearing out of most stock is now possible. Roses are probably as light now as they will be again this season. They are off crop and the weather is very unfavorable. Yet the buyers seem to be able to obtain sufficient stock to satisfy their wants in the morning, for afternoon trade is light.

Bridesmaids are in constant demand and everybody wants them. The use of Brides is restricted and consequently are not so much sought after. Brunner has color and form and helps out those who might otherwise use Beauties. The latter are not good. Specials are superior in quality compared with the shorter sizes, but of these there are few. Meteor sells well; other varieties not so generally used are easily disposed of now. The best prices on roses were made the last two days of the week.

Carnations are not coming in so freely as last week. They do not advance materially in price, as supply and demand are about equal. Violets are still abundant. They are all sold, but the quality is against any higher figures. The average for the past two weeks will hardly be exceeded. The quality was never better.

Valley shows no improvement in price. Tulips have been benefited by the shortage in roses and there are plenty of them at reasonable prices. This is also true of daffodils. Shipments of Harrisii increase; demand steady. Fine cattleyas of the first grade are cheap, which means that there is no diminution of the supply. There is plenty of smilax, more than can be sold, but much of it is of poor quality.

Seed and Bulb Trade.

A trip through the stores of this important branch of our business recalled the fact that the season of '98 had really started. Orders are coming in very freely and much earlier than heretofore. The open weather has started the ball rolling and let us hope, like the small boy's snowball, it will gather impetus and increase in size as the season opens. Scarcely any branch of the trade has suffered more the past few years than the seed trade, and so, like the seeds, "the kernels of prosperity," as some wiseacre exclaimed, may the jest come true. Let us try and catch this will o' the wisp, prosperity. I am sure we all need it in our business.

The Retail Trade.

Not much change since I wrote you last. There is no special rush, and I have not heard of any more delivery wagons being put on. Trade is "fair to middlin'," as one of the prominent men of the trade remarked.

Novelties are somewhat scarce. It is a wonder to me that something striking is not invented, some new fad introduced. The dry goods houses, the jewelers and the confectioners all have their novelties. I wonder if this is the reason why the retail florist does not more than jog along. True, there are novelties introduced in decorations, and so forth, but is there no use to set the pace and make a special flower fashionable? It is remarkable what few are worn by my lady and liege. Violets used to be "la mode." Did the artificial kill them, or did they die a natural death?

Is there no Beau Brummel that can be induced to wear a cattleya? They are very handsome and would help the market wonderfully. If some of the leading florists don't suggest it, I think I'll go and see some of the "yellow journals" and get them to use some of their influence.

I notice a few novelties in the windows. Acacia pubescens is very pretty and graceful. Then I saw some plants of laurestinus, "a wee, modest flower," but exceedingly chaste; then in another I noted some boxes of tulips tied with crepe paper and ribbon to match, one especially handsome box of yellow and another of lily of the valley.

To-night as I write Governor Black is being entertained by his staff at the Waldorf-Astoria. The decorations are by J. H. Small & Sons and are exceedingly rich and simple. Only about twenty people will sit down to dinner, the table decoration consisting of one large oval basket of red and white tulips interspersed with galax leaves and two round baskets on either side of same; tricolor ribbon, red, white and blue, draped with flowing smilax, gave it a pretty finish. The grand ballroom where the reception is held is hung with the stars and stripes entwined here and there with southern smilax. In the other reception rooms tall, graceful palms stand here and there, and red and white roses in vases on tall pedestals do sentry duty.

It being a state affair, the color plan of red, white and blue was adhered to as much as possible. It was difficult, however, to secure blue flowers of an appropriate color, which shows the necessity of a blue rose on such occasions. Won't some one please oblige?

Next week is the Arion ball—but of this later.

New York Market Florists.

At the regular meeting of the New York Market Florists' Association, held at Leach's restaurant, Tuesday, the principal business was the report of the committee on constitution and by-laws to be adopted by the association. Owing to the blizzard and inclement weather, there was but a small attendance. In the absence of the president and vice-president, Mr. Chas. Deitz was elected to the chair. Mr. J. P. Cleary, chairman of the committee, then read his report on the constitution and by-laws. He reported that the committee had held two meetings, January 12 and 19. The constitution was adopted, with several amendments, and reported back to the committee, who is empowered to send copies to all members before final action is taken, and, if necessary, to employ legal aid to perfect the constitution in case the association might wish to acquire a charter at some future day. The following new members were elected: R. Dreyer, R. Whitman, P. O'Mara, A. Reis, H. Kuhl, J. W. Withers, Harry A. Bunyard.

Several members expressed a wish to take stands, which now makes a total of 23 taken. They also furnished a guarantee fund of $5 each, so that the association is now fairly started, and the committee was empowered to see the city authorities to secure a definite understanding with regard to the renting of stands.

Mr. P. O'Mara then addressed the meeting in regard to the senate bill No. 2, mentioned elsewhere in our columns, and Mr. C. H. Steinhoff and himself were empowered to go to Trenton and protest against the bills as affecting florists. On a motion, the secretary was ordered to notify the New Jersey horticultural societies and clubs of the action taken and ask them to use their influence in protesting also.

Various Notes.

Mr. Robert W. Clucas, of the firm of Clucas & Boddington, will return next Saturday on the steamship "Lucania" from "Yurrup," where he has been on an extended business trip. Welcome home, brother "Bob."

The horticultural section of the American Institute held an orchid exhibition Wednesday, February 9, commencing at 2 p. m. In the evening Mr. Chas. H. Atkins, of Madison, N. J., will deliver a lecture on "Mimicry and Fertilization of Orchids," illustrated by over 400 colored charts. These exhibitions and lectures are free to all.

Owing to the date of the New York Florist Club's dinner, February 19, conflicting with the carnation meeting in Chicago, several members having decided to visit your city, the date has been changed to Saturday, February 26.—P. S.: The price of tickets remains the same, $5.

Mr. G. A. Lodewyks, who has leased the greenhouses of Mr. A. Brown, of Blissfield, L. I., will move there at an early date, and will grow plants and cut flowers for the New York market.

WASHINGTON.

Free Distribution.

Despite the stormy evening there was a good attendance at the last semi-monthly meeting of the Commercial Florists' Association. Two new members were enrolled, who wish to take an active part in our fight against the free distribution of flowers by the National Government.

Letters were read from several clubs asking information as to the kind and quantity of plants grown in the government greenhouses, and to reply intelligently and fairly a committee of three—your correspondent being one—was appointed to visit the greenhouses and make a list of what was being grown at the present time. The committee called upon Colonel Bingham the following day and stated their wishes, and for what it was wanted, and were turned down by that official by refusing necessary permission. Among other things the colonel said that he did not propose to furnish us with ammunition to bombard him with and would have to refuse the committee permission to visit the greenhouses. It was explained to him that we were in possession of necessary information as to what was being grown, but to avoid mistakes and to be absolutely correct was the reason for wishing to go again. Having done the polite thing, the committee on being refused permission, claiming the right as American citizens to enter any public building, proceeded to the grounds, and were refused admittance to either the grounds or buildings. Finally we were admitted to the office of the Public Gardener, who explained that he had received an order from Colonel Bingham that morning to close the grounds and buildings to all visitors. The committee felt very much pleased to think the club had actually caused an order closing the buildings to the public, an evidence of headway. Whether such an order will stand remains to be seen.

It is said on pretty good authority that great activity prevails there just now, and that shovels are busy throwing out carnation and violet plants, getting the houses ready for other services. I do not give this as being strictly accurate, though my informant ought to know. I only give it for what it is worth, since I am not permitted to see for myself.

The short visit revealed an immense ice box in use, also a quantity of wire designs for funeral work. Right here I would like to ask the person, who signed himself "Washington" in a communication to The Review, and who seems to have the inside track for information, how that refrigerator was purchased. Not out of the appropriation for the "free distribution of valuable seeds!" Was the law interpreted to include refrigerators, also funeral designs, and all the necessary paraphernalia for making funeral designs, or are the designs to be used for decorating the public reservations, etc.?

Trade Looking Up.

Trade has increased 200 per cent the past week, and entertaining is at its height. All the stores report good business, and prospects for a continuance of it. Bulbous stuff is selling well

and is plentiful. Roses and carnations are scarce. Violets can be obtained at any price. I saw a letter yesterday to a retailer from a grower who offered to furnish him any quantity at his (retailer's) price.

A Pretty Decoration.

There was a pretty decoration at the German ambassador's the other evening, the occasion being the emperor's birthday. The table decoration, while stiff, was pretty. The table was carpeted with Vervaeneana azaleas, violets and pink roses at opposite corners, with royal crown in violets in center. The ballroom was festooned with asparagus and smilax and several groups of palms.

Notes.

Mr. W. R. Smith has a rival in town, who is soliciting names to a petition for his place. As yet he has not secured a single florist's signature.

Prices remain the same as before, with the exception of violets, which seem to have no value. The fakir is very much in evidence with them on the streets. W. H. K.

ROCHESTER, N. Y.

Genuine Winter Weather.

Regular winter weather prevailed during the week past, not that the temperature was extremely severe, but just low enough to preserve a good covering of snow on our streets and insure steady, good sleighing, better, in fact, than we have had for some years. Transient trade was materially increased under these favorable conditions, for flowers are worn even on sleigh ride parties, and the young or old man who takes out his best girl in a stylish rig will also provide a bunch of roses, carnations or violets for her to wear while she sits close to him in the sleigh, snugly rolled up and surrounded by furs. The demand all around was satisfactory. The season for receptions and other entertainments has now fairly begun, and if not calling for extensive and very elaborate decorations, they invariably increase the daily consumption in all lines, and no overstock can be noticed in the flower market. Prices continue the same as last week, general quality of roses is somewhat improved, but "selects" are still scarce. Von Sions came in more plentiful for the last few days, and sell readily at $4 per 100. Carnations are abundant and good, but hold their former price; violets plentiful; Harrisii, and callas scarce; all bulbous stock in good supply; none of it going to waste so far. Throughout the month of January the demand has been steady, and plainly in excess of last year. Often our florists were bothered by a deficiency in the daily supply, although not to such an extent as to seriously hurt the business in general, yet if flowers had been more plentiful, it is very likely that the total receipts for the month would have been heavier under these favorable conditions.

Western N. Y. Horticultural Society.

The Western New York Horticultural Society had their annual session here January 26 and 27. The assembly was an unusually large one; 800 or more prominent men from all parts of the Union had gathered in the spacious hall; on the second day the attendance was estimated as being over 1,000. Mr. J. Hall, the untiring secretary and treasurer of the flourishing old society, deserves credit for his successful efforts in arousing increased interest in horticulture in so many different parts of the state and the country at large, devoting much of his time and labor in correspondence and making arrangements with railways and hotels to secure special rates for the visitors. Mr. W. C. Barry, the president, was agreeably surprised when seeing so large a congregation assembled, and stated in a short speech that never before in the history of the society was an annual meeting so well attended by its members from all sections. The great majority of the members are engaged in the nursery business, or in fruit growing, and the advancement of the latter is a principal feature in their discussions, which are annually published in full by the society, every member receiving a copy of the book.

Essays.

A lengthy paper was read by Prof. W. B. Alwood, of the Virginia Experimental Station, on the "San Jose Scale." Prof. M. V. Slingerland, entomologist at Cornell University, gave a report on the insect enemies of fruit trees, and also delivered an illustrated humorous lecture on "Bugs from a Bug's Standpoint." Geo. T. Powell, of Ghent, N. Y., prepared a paper on the "Relation of Our Public Schools to Horticulture." Another interesting paper was by Dr. L. L. van Slyke, chemist at the state experimental station in Geneva, N. Y., on "Plant Food." W. T. Mann, of Barkers, N. Y., spoke on "Experiments in Fertilizing Fruit Trees." Prof. W. H. Jordan, director of the experimental station at Geneva, gave his views on "Food Values of Fruit," and I. P. Roberts, director of the Agricultural College at Ithaca, N. Y., had for his theme the "Questioning of the Soil." "Reports of Committees on Plant Diseases" came next, by W. Paddock, of Geneva Station; another on "Vegetables," by F. Frank, Irondequoit, N. Y., and a most interesting speech on "Ornamental Trees and Shrubs," by our able Mr. Jno. Dunbar, of the Rochester parks. A most instructive talk on "Old Orchards," by Mr. van Deman, from Virginia, followed; then Mr. Paddock reported on "New Diseases of Fruit Trees."

Animated discussions were indulged in after each report, in which many members gave their individual experiences and views, and all were satisfied before they went home that they had learned a great many things within the last two days.

In an adjoining room Messrs. Ellwanger & Barry had a very large collection of fine fruit on exhibition; grapes, pears and apples, each in 35 to 40 varieties, and in excellent condition. These were greatly admired by the many visitors. K.

TORONTO.

A Golden Opportunity.

Business appears to be steady now—that is, about normal. There is no undue excitement. People are dying, marrying and giving birth at about the usual rate, and occasionally give social entertainments, and the supply of flowers to celebrate the various events is fully equal to the demand made upon it.

Most people one meets are afflicted with the Klondike gold fever just now, but I have not yet heard of a florist going up from these parts, although one would imagine that an expert funeral design builder would have a good oportunity of soon making a fortune up there.

The Horticultural Society.

The Horticultural Society will listen to and discuss two essays tonight, one from Mr. E. Utley, on "Seasonable Seed Sowing," and one from Mr. G. Mills on "Cyclamen." Other important questions will also be brought up.

Various Items.

Mr. Fred Brown, manager of Mr. J. H. Dunlop's King St. store, will start in business on his own account in the West end some time in February. Nobody has any doubt but that he will make a success of it, and he has the best wishes of all.

The Gardeners' and Florists' Association is to be allowed the ineffable satisfaction of sending two delegates to the Industrial Exhibition Association this year. Everything comes to those who know how to wait. We have been waiting for this piece of justice for a long time.

Mr. J. H. Dunlop left this country about two weeks ago, and though the reports from the various large centers in the United States have been carefully scanned, no account of his movements has yet been observed. They have heard from him regularly at home, though, and he will probably return some time this week, and no doubt a lot of good things will follow in his wake.

Plenty of snow, now: 10 degrees below zero on the 30th ult. E.

NIAGARA FALLS, ONT.

A horticultural society has lately been organized here under the supervision and support of the government. The moving spirit in this has been Mr. Roderick Cameron, head gardener of the great Canadian Free Park. What was some seven years ago a wilderness has been transformed by him into a beautiful park.

Formerly we had but one greenhouse here, but now we have several. The bulk of our sales are to our American

cousins, who seem to appreciate Canadian-grown flowers, but we are pleased to note a steady increase in our home consumption. W. P. L.

FINE VIOLETS.

We have received from Messrs. Crabb & Hunter, Grand Rapids, Mich., four bunches of remarkably fine Marie Louise violets. They inquire if there are any Marie Louise around Chicago that would beat them. We must reply in the negative. We have never seen any better violets in this market.

WANT ADVERTISEMENTS.

WANTED—I would like to correspnod with parties who may have Lilium Harrisii in 4-inch pots. I want 300 for April deliv ery. Name lowest cash price on same, now, pdr 100. F. N. Haddon, 36 Tyler st., Boston, Mass.

SITUATION WANTED- By a florist and gardener, private or commercial; 15 years' experience, who can grow carnations, mums, roses, etc. also vegetables under glass. Address A. H. Clark, Lansdale, Pa.

GREEN-HOUSE CONSTRUCTION.

This has been a specialty with us for many years and to us is due the credit for many of the great improvements that have been made in the construction of wooden green-houses. To those that buy our

Clear Cypress Building Material

we furnish, free of cost, complete detail drawings from which any intelligent workman can put up the material correctly. We have plenty of time to write letters ABOUT OUR BUSINESS, and we will be glad to hear from those contemplating building.

Write for Circulars or Estimates.

Beck, care of Florists' Review, Chicago.

MIDDLETOWN, CONN. — Henry Fountain recently had many of his plants destroyed by gas leaking into his greenhouses from the city mains.

PITTSBURG.

Club Meeting.

At the annual meeting of the Pittsburg and Allegheny Florists and Gardeners' Club, January 27, officers were elected as follows: President, E. C. Reineman; vice-president, George Oesterle; treasurer, James Semple; secretary, T. P. Langhans; assistant secretary, E. C. Ludwig; executive committee, Gustav Ludwig, T. F. Beckert, P. S. Randolph.

The club deemed it advisable to reduce the annual dues from $3 to $2. The new white carnation Evelina, sent for exhibition by Mr. R. Witterstaetter, Sedamsville, O., was awarded a certificate. Flora Hill, Jubilee, Victor and Charles A. Dana, sent by Edward Reid, Philadelphia, and grown by John Harkett, same place, received the praise of all present.

Trade Conditions.

Trade has improved a little of late, wedding receptions and other social functions making a call for quantities of flowers.

Present to Allegheny Park.

The Allegheny Park conservatory has been enriched by a beautiful present, a handsome specimen of Phoenix canariensis, 20 feet tall and with a spread of 20 feet, from Mr. John Bader, of Allegheny. Mr. Bader secured the plant during his recent trip abroad.

L.

SCRANTON, PA.

G. R. Clark completed the improvements to his store in time for the holiday rush. The addition of a handsome refrigerator built in on one side gives a beautiful appearance to the whole place. Mr. Clark handles an immense bulk of outdoor stock and notes increasing tendency to beautify the grounds of the middle as well as upper classes.

W. M.

Hail Losses.

Furrow Brothers, of Guthrie, Oklahoma Territory, lost a large percentage of their glass on the night of January 24 by hail, and James Frost, of Greenville, Ohio, lost between 700 and 800 square feet of glass on January 25 from the same cause. Both were insured in the Florists' Hail Association.

CHAS. L. MARSHALL,
67 Merrimac St., - - Lowell, Mass.

UTICA, N. Y.

The old saying with reference to the "early bird," etc., was exemplified when I happened at C. F. Baker's before he had taken the jackets from off the red fellows, or, in other words, had made the morning's cut of that great carnation Red Jacket, which with the blushing Oneida bids fair this season to cause commotion in the world of the Divine flower. I noted in the first place the disadvantages under which these are being grown—houses built in shape of an L and shaded considerably by surrounding dwellings. The result is all the more remarkable.

Red Jacket is a bold fellow, stands erect upon a stout stem, not a bursted calyx, which is as solid as the acorn of the oak. The plants have not been disbudded, so that the stock is limited, yet 'tis easy to propagate; but as the blooms have brought $1 per dozen right along the reason for not cutting the plants so closely is evident.

Oneida is a lovely shade of pink, that intensifies under artificial light, highly prolific, and produces a large flower. The main stems had been taken for purpose of propagating. Still from the vigorous side shoots I measured many blossoms that were over three inches across. It is a great flower, particularly for design or basket work. The stock being sent out cannot fail to give satisfaction—clean, with roots which carry solid balls of soil.

In yellows, Bouton d'Or stands pre-eminent. 'Tis a grand thing, and Mr. Baker is fortunate in possessing such excellent stock. It requires to be grown cold. His only complaint is that it is such a shy rooter.

In roses, Niphetos is indispensable for design work. Bridesmaid is the pink grown.

Some 300 pans of Coelogyne cristata, with healthy, plump bulbs, which bespeak a heavy crop of flowers, were seen; Cypripedium insigne also. I also noted a noble plant of the so seldom seen Arondoletia speciosa, a hardy greenhouse plant that produces a perpetual show in clusters of flaming orange-scarlet flowers. The wood is hard and not easy to propagate, growth somewhat slow, but makes a shapely plant and a most profuse bloomer.

Charles F. Seitzer is much pleased with the results of his experiments with Jadoo. Asparagus Sprengerii has made tremendous growth, and other stock is likewise thriving in it. His violets are the envy of his neighbors, who have lost the art and are constantly around to see what secret there is in being so successful. They are annually thus. 'Tis the finest stock I have seen this season, and now for the first time fertilizer in the shape of sheep manure liquid is being applied. A fine lot of runners have been taken off and potted up. W. M.

HUNT'S REVIEW OF THE CHICAGO MARKET.

The past week has seen every wholesaler daily straining every nerve in an effort to make stock and orders meet.

Orders have been plentiful, generous in number and size, and at times out of all proportion to stocks in sight.

The main call has been for white stuff—roses, carnations, callas, Harrisii and fine stuff; everything in white, in fact, has gone even before being received.

Good maids and Beauties have been also actively sought for and perhaps have fallen below demand in greater degree than anything else, as they have no substitutes.

The stock now coming in, in most cases, is good. Perles, perhaps, are the farthest from the standard. Other varieties are improving and much really fine stock is being received daily. Doubtless much stock has been shipped lately that ordinarily would not be, but stocks must not be judged by that.

With all the scarcity, according to daily reports, prices have not advanced as far here as at other competing points.

Should the present severe siege of zero, windy weather continue, it will not take long for another advance, probably affecting bulbous stuff as well.

Violets keep coming in good supply.

Tip top freesias are to be had.

White tulips and daffodils are good and plentiful, though not at all overdone.

A good many calls for Carnot for special occasions—with none to be had. Don't this rose bloom in midwinter?

A good many orders placed, well distributed, for next week. Business should be good.

OMAHA.

Business Quiet.

Business is somewhat quiet, with stock good and plentiful and therefore prices down. Dutch hyacinths are coming in and sell well.

A Show Next Fall.

The Nebraska Florists' Society held its monthly meeting on January 13, at which it was decided to hold a chrysanthemum show this year, that of last year being such a success. The florists pledged themselves to do still better in the way of growing new and rare varieties. The society now has a bowling team and have met with gratifying success for beginners; some travel sixty miles each week so as not to miss the fun. A shooting team is now being organized. J. J. H.

CARNATION SANDUSKY.

We have received from Messrs. E. Hall & Son, Clyde, O., a box of blooms of this new carnation. It should certainly find a place among the fancy sorts. It has a white ground heavily striped with carmine, the flower of good size, with perfect calyx and borne on good stem.

...BAKER'S...

NEW CARNATIONS

Grown and Tested Five Years.

ONEIDA pure pink, no trace of purple, rust proof, perfectly healthy, good grower, continuous producer, blooms of largest size.

RED JACKET bright red, of largest size, healthy, no rust, continuous producer, long stiff stems, never bursting calyx.

$10.00 Per Hundred.

Orders booked now to be shipped in rotation as fast as rooted.

CHAS. F. BAKER, Utica, N. Y.

SIMMONS'

New Light Colored CARNATION

Mrs. S. A. Northway

We introduce this variety with even more confidence than we did Portia, Silver Spray, Tidal Wave, Daybreak, Rose Queen, or J. J. Harrison, knowing that it will become as great a cut flower variety as any of the above. Plant of strong, free growing habit, entirely free from disease or rust; large round high built flower with perfect calyx and extra strong and long stem. Color a beautiful soft shell pink becoming almost white when fully open.

Orders booked now and filled in rotation. We shall commence to ship soon after Jan'y 1st. Price, $10.00 per 100; $75.00 per 1000.

Geraniums. Md. Bruant, Md. Jaulen, Fleure Poitevine, J. Ricaud, and J. Sallier, 2¼-in. pot plants, $5.00 per 100. Rooted cuttings, $3.00 per 100; $25.00 per 1000. Our superb stock of all the finest sorts, 2¼-in. pot plants, named, $25.00; unnamed, $20.00 per 1000. Rooted cuttings, $12.50 per 1000.

Fuchsias. A grand lot of summered-over stock in small pots that will make early bloomers, $3.00 per 100.

All Rooted Cuttings Cash with Order.
Our Price List describes many other fine plants. Send for it.

W. P. SIMMONS & CO., - Geneva, Ohio.

Two Great Sports.

Carnation Victor.

Undoubtedly the best Pink Carnation in commerce and certainly the most prolific bloomer, perfectly healthy and of vigorous growth.

Rooted cuttings now ready, $4.00 per 100; $35.00 per 1000. Come and see this Carnation growing.

Chrysanthemum Pennsylvania.

The finest yellow for cut blooms or exhibition purposes ever produced. Plants ready March 15, $5.00 per doz.; $35.00 per 100; $250.00 per 1000.

HUGH GRAHAM
104 South 13th Street, Philadelphia.

FIREFLY!

A Rust-Proof Carnation for Business.

Bright scarlet and Positively RUST PROOF and as productive as Scott. Rooted cuttings, Feb. 15th, $10 per 100, $75 per 1000. Send for descriptive list of Firefly and fifteen other novelties of 1898, as well as fifteen varieties of '97; also older standard varieties.

Geo. Hancock & Son, Grand Haven, Mich.

SMILAX FINE STRINGS 12 1-2 CENTS

A. J. BALDWIN, Newark, Ohio.

The key to success is proper ventilation and watering. The key to proper ventilation is the Evans' Challenge Ventilating Apparatus. Works easily, does the work right, built to last, always satisfactory. No toy imitation but a machine to do its work and do it well. Much the cheapest in the end. Quaker City Machine Co., Richmond, Ind.

Z. K. JEWETT & CO.,
SPARTA, - - WISCONSIN.

HOLYOKE, MASS.

Mr. E. Howland grows quite a number of Wootoon and Sunsets, which are found profitable, and well grown Perle, Brides and Bridesmaids are grown in less quantity, also Beauty. Luxonne is the best single violet. A capital batch of cinerarias and primulus vanished like smoke at Christmas. Spring stock is promising. Carnations were in heavy crop during December, just when needed most. His foreman, Harry Sinclair, at the request of the Horticultural Society, read his maiden paper on chrysanthemums, on which subject he is an enthusiast. It was so well received that he has the pleasure of reading another at the meeting of the Hampden County Horticultural Society, Springfield, February 4. That's right. Let the latent talent shine. It will help the good cause along.

E. D. Shaw, while reporting a good holiday trade, considers business not what it should be at this time. Hosts of others echo this, and report December and October as both being exceptionally dull months. Christmas compensates for a deal, but business has been very spasmodic during the past year, and the published reports so carefully prepared by a contemporary should be read with interest by those who are of the opinion things are not or have not been what they consider they should be.

H. W. Field, of Northampton, is doing a good college trade. This is an annually increasing and more critical. None but the best stock will sell. Evidently Mr. Canning is doing excellent work among the students in educating their tastes for that which is lovely in Queen Flora, and what is there associated with her that is not? W. M.

All well rooted. Satisfaction guaranteed or money refunded.

Always mention the Florists' Review when writing advertisers.

BUFFALO, N. Y.

A Visit to the Botanic Garden.

"There's many a slip 'twixt the cup and the lip," and the fortunate (?) bidder for the new range of glass is not yet assured, as the bids have been thrown out and re-advertised for, to be in by February 10. Prof. Cowell is a disappointed man, and the safe receipt of a case of Catteya labiata over which that worthy was poring upon my arrival will not assuage his chagrin. Some appreciative friend down in British Guiana was the sender. Mr. Cowell has already a large number of orchids. Among those in flower are Cattleya labiata alba, Percivalliana, Oncidium bicallosum and Cavendishianum. Oncidium ungriculatum has been constantly flowering since August. The flower is orange and brown, richly marked, borne on a large spike, blooms all winter. Laelia albida was seen in quantity. The fragrance of this variety is very sweet.

The display of cyclamens is a gorgeous one. Some specimens have carried 100 open blossoms by actual count at one time. As there are thirteen sources of supply represented, and almost all equal, but little preference can be given to any one source. I noted a fine batch of Primula obconica grandiflora, many blooms measuring 1½ inches across, which would be considered good in a Chinese primrose not so long ago. I might mention right here that William Scott has a strain unsurpassed. Some specimens now in bloom are a grand sight.

Mr. Cowell has quite a batch of rhododendrons and Azalea mollis, seedlings just showing up. He has a pretty lot of Marie Louise violets in pots just crowded with bloom, doing even better than when usually planted out.

Fine Stock at Cortu and Lancaster.

In last week's Review mention was made of visits to Corfu and Lancaster, the out-of-town houses of Messrs. Scott and Palmer, and the splendid stocks each was producing. I can indorse that report. In fact, this season is witnessing some of the finest stock yet produced and shipped into the Bison city, not omitting the grand roses being shipped right along to W. F. Kasting by George Fancourt, of Wilkesbarre, Pa.

Mr. E. Salyer now With I. G. Marvin.

Writing of Wilkesbarre reminds me that Edward Salyer, formerly with Messrs. Smith & Son, of Adrian, and recently with Grove P. Rawson, at Elmira, N. Y., is now with I. G. Marvin, so we may look for as great results as were accomplished by Mr. Salyer when with the preceding gentlemen. W. M.

Use Economy and Make Your Own Pots

THE COW MANURE POT is the best in the world for young plants. For bedding it is absolutely the best thing ever invented. The cow manure forces the plant and is healthier. In the clay pots the roots are disturbed in putting them out; but in this pot you do not have to disturb the roots. You squeeze the bottom of the pot and set it in the bed. It never stops the growth of the plant. It holds the moisture better, especially if you have a dry summer. You can make from 2000 to 3000 pots a day. Every gardener should have one of these machines for potting. Directions sent with machines. Price **$5.00.** Address

WHY HALT AT SEEDS?

The main objection to the appropriation by congress of $130,000 for the distribution of seed must rest upon the ground of inequality. Mr. Fitzgerald, of Boston, proposed a broadening of the scope of the distribution by adding fish hooks and bait for the fishermen of his district, but this would not go far enough. The average man does not wish to be left out. Why should not the government issue pens and paper to writers, brushes and paints to artists, colts to stock breeders, eggs to poultry raisers, and ultimately even brains to congressmen?—Boston Globe.

If you grow good stock for the Chicago market you can get the best returns by consigning to Vaughan, McKellar & Winterson.

Prices and Particulars on Application to

The American Jadoo Company,

817 Fairmount Ave., Philadelphia, Pa.

AN UNPARALLELED SUBSCRIPTION OFFER.

EVERY one to whom this issue of the FLORISTS' REVIEW is addressed, and who fills out, signs and returns the accompanying subscription blank, accompanied by $1.00, within 30 days from date, will receive not only the FLORISTS' REVIEW for one year but also a certificate entitling him to the earnings on one-tenth of a share of stock in the company formed to publish the paper. The shares will be of a par value of $10.00 each.

Why do we make such an unparalleled offer? It is very simple.

You will have an interest in the success of the paper.

You will see that you can buy everything that you want to just as good advantage from advertisers in the FLORISTS' REVIEW as elsewhere and at the same time benefit yourself by increasing the earning power of your certificate.

This mutual arrangement cannot fail to bring to the paper a heavy advertising patronage, and as a result the stock represented by your certificate will earn good dividends.

And the more you buy of advertisers in the FLORISTS' REVIEW (always mentioning the paper) the larger your dividends will be.

You will get a better paper than has yet been published in this field, and a share of its earnings. Please let us hear from you by early mail.

Palmer's Hotbed Mats

FROST PROOF

MADE expressly for winter covering of hotbeds, cold frames, plants and seeds of all kinds.

INDESTRUCTIBLE, CHEAP AND WARM,

Will not harbor mice or vermin. Easily handled. Dry out quickly after rain. Have now been in practical use three years. Cost less than old-fashioned straw mats and entirely take their place. **MADE IN FOLLOWING GRADES:**

No. 1. **Burlap Cloth,** filled with combination wool and quilted, seams 3 inches apart and edges firmly bound. Size 40x76 inches, 50c each. Size 76x76 inches, 75 cents each. Made any length 76 inches wide, at 12 cents per running foot.

No. 2. **Duck Cloth** outside, filled and quilted same as No. 1. Size 40x76 inches, 75 cents each. Size 76x76 inches, $1.00 each. Made any length, 76 inches wide, at 16 cents per running foot.

No. 3. **Waterproof,** made of oil duck, filled and quilted the same as Nos. 1 and 2. Size 40x76 inches, $1.00 each. Size 76x76 inches, $1.50 each. Made any length, 76 inches wide, at 20 cents per running foot.

That these mats are a **much needed improvement** over anything heretofore used for the same purpose, is demonstrated by the large demand and many testimonials from prominent men in the trade. Everyone using Hotbed Mats should give them a trial. We also make

QUILTED HORSE BLANKETS,

THE CHEAPEST, WARMEST AND STRONGEST IN THE WORLD.

THE WEEKLY

FLORISTS' REVIEW

FLORISTS' PUBLISHING CO., 520-535 Caxton Building, CHICAGO.

Vol. 1. CHICAGO AND NEW YORK, FEBRUARY 10, 1898. No. 11.

A CORNER IN THE PERENNIAL BORDER AT LINCOLN PARK, CHICAGO, WITH HELENIUM AUTUMNALE IN BLOOM.

THE PERENNIAL BORDER AT LINCOLN PARK, CHICAGO.

Helenium Autumnale.

The helenium is one of the most useful of the middle-sized yellow flowered perennials, as it fills the place between the phloxes and asters below and the taller sunflowers above. Its profuse wealth of golden bloom lights up the harvest borders with a solid mass of color no other plant can equal. The middle group in the engraving shows its brightness after being in bloom nearly a month.

In size it may vary from eighteen inches, as usually seen in native slough edges, to five feet or even more, as it grew this year in the perennial border in Lincoln park.

The helenium has the further advantage of keeping within bounds; its groups do not spread unduly as do too many of its composite neighbors, while its offsetting habit makes it quite easy to divide and transplant.

The group of flowers at the left in the picture are the decapetalus sunflower, a peculiarly bright sulphur yellow. It does not usually grow so tall as this but is always effective.

The dark group in front at the right it Perilla nankinensis, an old-time favorite, which always blends well with any kind of foliage. It is one of the most thrifty plants in cultivation, a desirable contrast to its pampered relative, the coleus. J. H.

LYCHNIS SEMPERFLORENS PLENISSIMA.

In my last notes I recommended the old well known pinks to the florists catering to a home trade in the smaller towns. Today, with your permission, I will say a few words about a comparatively new, but equally hardy plant, which has not yet been tried in many places, for forcing under glass and which can safely be recommended for growing largely, not only for a local trade, but also everywhere else. My humble opinion is that great quantities could be disposed of if its many good qualities were better known. Lychnis semperflorens plenissima is not a coarse leafed plant like L. flos-cuculi or L. vespertina, nor does it grow very tall. The foliage is lanceolate, narrow and bright green in color. Branching flower stems, 15 to 24 inches high, are springing up among the leaves constantly in uninterrupted succession if the plants are kept in growing condition, which is not at all difficult to manage. The temperature of a carnation house or even a violet house will suit them admirably and we know of no disease whatever which attacks either foliage, roots or flower spikes; the plants have always been clean and healthy with us.

When we first came into possession of the plant, several years ago, we had no proof of its hardiness and therefore on the approach of cold weather we potted about a dozen of them for stock to propagate from, should our winters prove too severe for those left outdoors unprotected. We found room for the potted plants in a corner of the carnation house, where they started into vigorous growth in less than a month's time and began to send out young flower stems. Seeing their desire to bloom, we allowed them a little more space, repotting them at the same time into 5-inch pots and had no reason to regret this little extra care. They rewarded us with an occasional bunch of very serviceable and neat flowers, which could readily be disposed of to any customer in search of loose, delicate sprays for vases, etc. Another repotting was necessary before spring. The plants kept on producing new growths and new flower stems as well, and by these gratifying results we were induced to try them the following season in a bench, where they have done admirably well under the same conditions and treatment with the carnations.

Since these preliminary trials we have also grown the plants over summer in 3 or 3½-inch pots, planting them in the bench in fall; with this treatment we are enabled to cut some flowers as early as September, but the same stock, when grown in the field until fall, would have perfected many more crowns, ready to produce a greater quantity of flower spikes during the season than we could expect from the little potted plants; yet the latter can be planted closer in the bench and perhaps in the end we get about as many sprays from these as on the stronger clumps on a given space. The soft pink color of this lychnis and the way it produces its many finely shaped flowers in long, light, airy and graceful sprays cannot fail to give universal satisfaction in all fine floral work. Its keeping qualities also are excellent and we may have it the whole year around, for it blooms as freely in the open ground all the summer and fall months as it does in winter under glass. In an ordinary light garden soil, moderately enriched and well drained, it would never be without flowers if frost did not stop growth late in the autumn.

A stock is readily worked up from a few plants by dividing in early spring, every growth with a few rootlets attached will then grow quickly into strong tufts, producing hundreds of flower stems that same season if allowed to remain. But where plants are wanted for forcing in winter, we have always followed the old practice of keeping the stems pinched out until the plants were housed. When you have no stock out doors, cuttings from those grown on a bench or in pots may be taken at any time and are sure to root; if well taken care of, they will make blooming plants in less than three months. From the above notes it may plainly be seen that Lychnis semperflorens plenissima is one of the few good things which can be relied on to furnish us with a supply of elegant cut flowers at all seasons.

With ordinary care the patch in the garden will continue in full bloom until the approach of cold weather, while from October to May we have an abundance of them under glass, providing we have benched or potted suitable stock early in September. The cultivation of this deserving plant under glass presents no difficulty at any season. In a light and airy house near the glass it does better than in a house where the atmosphere is kept closer or where more moisture and heat are required for the other occupants of the benches. Like the carnations, they dislike overhead watering, especially in prolonged dull weather, but the results in their case are not so disastrous to their welfare, the plants soon recovering their vigor when normal conditions are restored in their surroundings. K.

APONOGETON DISTACHYON.

A few flowers of this beautiful plant occasionally appear as a novelty in the windows of some of the best flower stores. It is certainly a novelty, too, in the cut flower market, though far otherwise as a cultivated plant, having been in cultivation for more than 100 years. It was introduced to Europe from the Cape of Good Hope in the latter part of the last century and has become so completely naturalized upon some lakes and streams as to appear like a native so great is its luxuriance.

Doubtless much might be done with it in American waters in southern latitudes, but the present object of this note is to advise those who have the facilities to give it a little attention under glass for winter flowering, and small indeed are its cultural needs. Grown under glass it would be an everblooming plant as in outside waters it flowers persistently till forced to a reluctant rest by the freezing of the water.

I have gathered flowers of it in midwinter when that season has been unusually mild, so that no forcing conditions are necessary under glass to ensure flowers in abundance during winter months. Tanks, tubs, or any receptacle of sufficient size and convenience could be utilized for its cultivation, placing in the bottom of them about a foot of compost consisting of loam and well rotted cow manure in proportions of about 3 to 1. The temperatures at which rose and carnation houses are kept will suit admirably and like these the aponogeton will enjoy all the sun it can get. As far as my observation goes of the plant under natural conditions it always appeared to thrive best and flower most abundantly along the margins of running water or in lakes through which there was a constant flow. This would indicate that it likes a change of water more or less frequently, conditions that can be met under cultivation by turning the hose into its tank or tub occasionally. The plant has a fleshy tuberous root, broad and flat at its apex, narrowing to almost a point

Aponogeton Distachyon.

at its base and from the crown of this tuber it sends out long roots in the soil surrounding, whilst the leaves and flower stalks find their way to the surface, each stalk terminated by an oblong leaf that floats on the water.

The flowers are borne on a forked spike (hence the name distachyon, meaning two spiked), are small and inconspicuous in themselves, but they are disposed in clusters in the axils of large showy white bracts. These bracts give the spike its color attractiveness, but the flowers have also a welcome charm in that they possess a delightful fragrance so sweet as to have earned for the plant the name "Water Hawthorn." The Cape Pond weed is another popular name for it and it matters not which is used, either being greatly preferable to its botanical cognomen, and should be used by those who would popularize the plant and sell its flowers.

When once the plant is strongly established it spreads freely by root increase and also reproduces itself from its own self-sown seed. Dry roots are also obtainable at times, these being imported from the Cape. The beginner with dry roots, however, must exercise caution in starting his plants, otherwise he may lose the lot. When the dormant tubers are potted up they are dry and more or less shrivelled. If then introduced to aquatic conditions there is a risk of the root tissues swelling too rapidly and rotting in consequence. It is better for a start to treat them as ordinary plants, planting the tuber, with its crown just covered in a pot of soil. It will then absorb moisture gradually, swell normally and when top growth is visible and well under way the plants may be immersed with safety. When new plantations are being established with divisions from growing plants no such precautions are necessary; these can be planted direct into other tubs or tanks. A. HERRINGTON.

FUMIGATION.

The method of fumigation described by Mr. D. K. Herr in the first issue of The Review (page 13) has been tested in the Station greenhouses with good success. When the order was given for the pans the description was not at hand, and as constructed they are much larger than Mr. Herr's, but work well. Not having cigar waste at hand, pulverized leaf tobacco was used. The smoke obtained by this method is not dense, but is penetrating. It is the long-continued application that makes it effective. The tobacco burned for six hours in a house containing a varied collection of plants, and none were injured. FREDERIC CRANEFIELD.

Wis. Exp. Sta., Madison, Wis.

THE GUELDER ROSE FOR FORCING

The growing desire for more of novelty and variety wherewith to tempt the public leads one to survey a wider field for available material, and in doing so, the Guelder rose or snowball tree (Viburnum opulus sterilis) comes within the range of vision as something that would probably take if offered. That it is amenable to forcing has long been proved and I have seen large bushes that were forced for years and proved acceptable adornments for the conservatory in the early months of the year. It is a flower, too, that can be effectively used in a cut state for decorations. In this connection I recall some large bushes that grew in the shrubbery at home and how useful they were to cut from for church decoration at whitsuntide. Whole branches, borne down with their weight of snowballs, were lopped off and used most effectively.

In order to make a success of it for forcing one would need to have selected or specially prepared plants that were well grown, possessing from six to ten good strong shoots of the previous season's growth and from two feet to three feet in length. These could be forced in pots of from eight inches to twelve inches diameter. Upon such shoots there should be no difficulty in securing six to eight fine clusters arranged in pairs and cut as they could be with two feet of stem, they would look admirable when set up in a suitable vase. As a pot plant for the Easter trade it would certainly find favor and is a fit subject for extensive use in large decorations. Even more beautiful for pot culture, is its Japanese relative, Viburnum plicatum.

Plants of both these viburnums can be obtained cheaply in any good nursery where trees and shrubs are grown, but it is too late to think of purchasing now for present forcing. To secure good forcing stock, however, I would advise those who have a spare plot of ground at home to grow their own.

Purchase the plants in the coming spring and upon receiving them prune close, and plant them out in a piece of rich, well cultivated ground. Mulch them in summer to protect them from drought and if the stock has been well selected and well handled there should be some good forcing material ready for lifting and potting before hard freezing sets in. Any plants not strong enough can remain for another season. If a demand sprung up, however, a supply would doubtless soon be forthcoming and it would be just as easy to purchase vi-

burnums for forcing as it is lilacs. I am advocating an experiment, however, and every one waits for some other fellow to demonstrate the possibilities.

A. HERRINGTON.

Madison, N. J.

CARNATION NOTES.

New Varieties of 1897.

Before I enter into any discussion of the new varieties introduced the past season, I will say a few words in continuation of my last notes on types, and will conclude with the different build and forms of blooms of varieties now in cultivation.

Build and form of blooms differ as much as habit of the plant. Different tastes have different ideals, and to pronounce any one form as the ideal one would seem rather overbearing. From a commercial standpoint, all forms are desirable so long as they find purchasers. Again, desirability depends upon adaptability. If one is asked to pick out his ideal from among a handful of flowers of different form, the choice would probably fall upon the most symmetrically built and best rounded form, like a camellia or daisy for instance. As a buttonhole bouquet these have the preference, but in masses, as in a basket or large bouquet, these symmetrical daisy-like blooms appear stiff and monotonous and it is a relief when the eyes can rest on a bunch of irregularly built blooms.

We find varieties with round, smooth or more or less fringed petals; the same arranged symmetrically or rather irregularly; also, flat, where the petals are spread out horizontally, or rounded where the center petals stand erect; again, where the center petals appear in an irregular arched form; and where all petals have a tendency to incurve. This latter form is objectionable as it reminds one too much of the flower in the last stages, going to sleep. And, then again, we find blooms where the petals in all forms and positions appear wavy and crimped.

We have at this time a very interesting sight in our seedling house, regarding habit of growth and form, and color of blooms. There are 160 selected varieties of 1896 on trial blooming the second season, from 5 to 15 plants of each, and 500 seedling plants of 1897 selected from 2,000 out of the field. It furnishes a very interesting and fascinating study to see the many different habits, forms and colors side by side.

It is not my intention to enter into a criticism of the new varieties introduced last year; neither would I be justified in doing this, for in the first place one must have a wider range of observation than I have, their cultivation on our place being in rather limited numbers, and during their field culture having been retarded in their growth by a severe period of dry weather. The severe drouth left the plants small, and this affects two very important points, namely, their ability as free bloomers in the early part of the season and their respective strength. Therefore I must necessarily confine myself to the observations as they came under my notice on our place, well convinced that success or failure of a variety as experienced at one place cannot be conclusive for all sections.

Flora Hill: This variety stands foremost among the whites introduced the past season, and is without doubt a decided improvement on the older varieties. The summer growth has been clean and strong, showing a very pleasing habit, slightly spreading, thus not appearing compact. The foliage, medium between the grassy and broad-leaved form, is of that much desired bluish color, and of a texture capable of much resistance to disease, especially rust. Our plants when received were entirely free from this disease, and have remained so up to this date. I do believe that under certain circumstances, with which we are not as yet familiar, no variety is rust proof, and this variety is but a confirmation of this assertion, as from a few localities we hear that rust has made its appearance, while the general report proves it free from this disease.

Bacteriosis seems to have more power over this variety, for I could find traces of this disease from the time we received our rooted cuttings up to present date. The first weeks when housed it increased rather alarmingly, but soon diminished under normal treatment and culture, and at this time the young growth is showing scarcely any signs of the disease. Further regarding the health of this variety, I am happy to say that we have not lost one plant, while among other varieties we experienced the fatality of stem rot, this variety being exempt.

It commenced to bloom early, and the early flowers naturally not so large, were to my taste the best formed. With the advancing vigorous growth the flowers grew larger, but at the same time assumed a coarser, more rugged and crimped appearance, differing much from those which have been shown at the exhibitions last year, but this can be greatly alleviated by giving the flowers time to develop, which should therefore not be cut too young. When the buds open we often find a light penciling and shading of pink, but this disappears entirely even before the flowers are fully developed and leaves them a pure white.

As to their keeping quality, I had an interesting experience. I selected some blooms for seeding and removed, as customary, the anthers and some of the inner petals, in order to give the pistils more room to develop. The remaining petals expanded fully in a short time, but it took five to six days before the pistils were sufficiently ripe for the fertilization. All this, under normal conditions, shows the time for the full development of the blooms. To my surprise some of these blooms failed to produce any pistils and kept in a fresh condition on the plants for over two weeks; stems appearing a little weak at first, but gaining rapidly in strength and length under a vigorous growth; calyx strong and perfect.

As to the quantity of blooms furnished up to date, I can not do otherwise than call it free. We labored under a disadvantage, for the plants were not up to size when taken in from the field, and later on we were obliged to depend upon them for cuttings, and for this reason I am hardly in a position to give an approximate estimation as to what the plants can do under favorable circumstances. As far as I could observe, this variety is not entirely exempt from cropping, but is scarcely seen without any blooms at any time and the period between crops is very short.

To give a summary of the whole, I cannot call this variety perfect, for perfection has not yet been attained, but it stands at the head of the white varieties disseminated and now in cultivation.

FRED DORNER.

RATS AND MICE IN CARNATION HOUSES.

Will some of your readers tell me how to get rid of rats or mice in carnation house? They are cutting a great number of buds for me. I have tried poison (Rough on Rats) on bread and butter, also on cheese, but they do not touch it since the first night or two. I found a piece of bread a few days ago in which they had eaten the bread down to the butter and poison, leaving the poison as nicely as I could have sliced it off with a knife.

I don't know just whether they are mice or rats, as I have seen both in the house at intervals. The day after placing the first poison I got hold of a very sick rat, which I killed. I believe the mice are not usually considered so cunning, and I have always been able to catch them in traps with bits of

A Vase of Roses. Simple Floral Arrangements. No. 4.

cheese. I would appreciate suggestions from any one who has had experience with these pests. They have worried me more than anything with which I have had to deal lately.

"SUBSCRIBER."

I have found to my sorrow that mice and rats can cause a great deal of mischief in a carnation house. The mice climb up on the flower stems and by their weight cause the stem to bend over near to the ground; or when the stem is supported I have noticed them climb up to the flower, bite it off below the calyx and let it drop to the ground, when they descend and eat their meal, consisting of the seed pod. I could always kill them with poison scattered over the bench.

The rats of which "Subscriber" speaks must be of the educated class. I remember some rats at our place that would not touch poison nor enter any trap. The boys made a trap of a board heavily weighted that would drop when the bait underneath it was just lightly touched, but these rats got away with the bait without being caught. At last the only thing we could do was to watch for them and shoot them. I did not notice that the rats touched any of the carnation buds.

The best preventive for these depredators is a cat or two. Since giving them free access to all the houses, I can see neither rats nor mice. There may once in a while be a pot thrown over, or they may take a walk over some plants, which I wish they would cease to do, but these little unpleasant things will not cause much damage, and can not be compared with the depredations of rats and mice. Get a cat.

FRED DORNER.

SIMPLE FLORAL ARRANGEMENTS.

A Vase of Roses.

The florist is often required to arrange loose flowers in vases or otherwise, usually for the adornment of tables or mantels. Orders for this class of work sometimes come slightly out of the regular course of business, like the following: A lady telephoned that she had just got a lot of roses that were to be used to fill a large rose bowl, and she did not know how to place them. Would I send one of my young men over, with some maidenhair fern, to fix them for her? I did not get angry and refuse to have anything to do with the job, as some would have done, because we did not furnish the roses, but the young man went, accompanied by a lot of good adiantum, arranged the flowers to the lady's satisfaction, and we charged her a good fair price for the material and service.

Once when I was much younger than now, I did get angry at one of the tactless, unbusinesslike patrons sometimes met with, usually women, and refused further negotiations. She brought some hyacinth bulbs to me in the hotel corridor, and asked me to start them for her, and said: "I hope you will bring me back the bulbs I give you, and not substitute poorer ones in their place, as these are very choice." I drew my dignity around me, buttoned it close, and thus replied: "Madam, you evidently do not know me. If you think I am capable of doing such a thing you had best keep your bulbs." She tried to reopen the deal, and apologized as well as she could, but I went away leaving the bulbs in statu quo.

The illustration this week is sent for two reasons: First, to show what may be done with very ordinary material, if care is mingled with it; as the flowers shown were some left after the best had been culled from the lot, and four of the roses were quite unsalable; and the holder is simply one of the cut flower vases in which roses are kept in the refrigerator. Secondly, it shows how color values may be rendered in black and white by an ordinary photograph, by using proper care and appliances.

The roses used were, beginning at the back of the group, President Carnot, Meteor, Beauty, Kaiserin, and Bride; and the object aimed at was to make the best use of the material, and avoid undue crowding.

W. T. BELL.

Franklin, Pa.

VIOLET NOTES.

The watering of violets is a theme on which there seem to be many theories, but I think real success comes from using a good amount of common sense coupled with good judgment regarding existing surroundings. To lay down any hard and fast rule is to in-

sure failure as certain as any other way. We have at times sprayed our steam pipes hard, in the morning, and filled the houses with fog, but this was when the outside conditions were right and the day was sure to be bright. However, this is an exceptional treatment to be seldom used, and never unless everything is just right and never in the dark winter months.

In watering, the plants often like a good, heavy soaking directly on the crown of the plant, that is, let the stream fall right on the plant at a few inches' height, taking care not to have it have force enough to wash out the plant. They are plants that delight in much water, requiring frequent soakings of cool—yes, even cold—water, often when the ground looks as if it were wet enough, yet they seem to need fresh water. Of course when your soil is a heavy clay with poor drainage, you are handicapped in watering properly, as it will not drain off rapidly enough. Tempered water we have no use for in violet culture, as it will be found to check their flowering almost immediately, at least that is our experience.

We have been testing two houses side by side, spraying one, and watering between the plants in the other; at the present time I do not think any grower could in any way tell which was sprayed and which was not. But this does not mean that we spray always and indiscriminately; not by any means, but I do think they like to have the air washed (if I may put it so) as well as to have themselves washed, and I believe it tends toward a healthy growth to have a house freshened in this way when the weather and day will permit it.

Then, too, if you wish a house to be healthy there is another thing to be taken into consideration and that is cleanliness. Keep the paths well swept, all dead leaves and rubbish burned; go over the plants often, taking care to pick all the leaves turning yellow and old, and the buds and leaves which occasionally get broken off when picking, which, if left, soon wilt and rot, cutting off more leaves and flowers with which they come in contact. After cleaning up a bed in this way, is one of the times when we like to apply the soaking on the crown of the plant, as it thoroughly cleanses it and it is a pleasure to see it stiffen up with this treatment after handling it over.

R. E. SHUPHELT.

ORCHID SEEDLINGS.

Kindly endeavor to prevail upon Mr. H. Clinkaberry to give the readers of The Florists' Review his method of raising orchid seedlings. The matter of cross-fertilizing most of the commercial sorts is rather simple. We would like to know more about the best material on which to sow seeds and treatment while in diminutive state. Conditions of moisture and material must be of great importance in this work. NOVICE.

In reply to Novice's question as to the best means of raising orchids from seed, we will conclude he already knows how the cross-fertilization takes place, and so that much can be dispensed with in replying to him. In sowing orchid seed I find it of very great importance to have the seed bed in a good condition, and also it is a most important thing to have it in the best possible position. By a good seed bed I mean on a suitable pot or basket, where there is already growing a live plant. I have had my best results, in fact my only success, when sown on such a bed. The most perfect condition so far as my judgment goes is when the plant where our seed is to be sown has been potted about a month. By that time it will be apparent if any fungoid growth is to make its appearance. Should there be any it will be disastrous to sow, but if all is sweet after that time, then it will be safe to think none will appear and seed may be sown with hope of success.

We will surmise that the plants which are used as seed beds are potted in the usual way, with a mixture of about one-third fresh sphagnum moss and two-thirds fern fibre of the best quality. Plants which I intend for seed beds are potted more firmly than are ordinary plants, and previous to seed sowing I carefully shear off the moss and rough fibre to insure a nice, smooth surface. Then before sowing the seed I soak the plant well in a bucket or tub of water, and sow directly after immersion. By this means the seed clings to the material and becomes less liable to be washed off.

Cypripedium seed is always sown on a pot which stands on the bench, cattleya, laelia and dendrobium seed on baskets. I find I get the best results by making no attempt to coddle them, but endeavor to select a position where it strikes one as being genial, and where much seed sowing takes place it is certainly best to keep all those plants together on which seed is sown, say, some snug corner where there is least fear of draughts and where there is likely to be the least fluctuation in temperature. Cattleyas, laelias and dendrobiums are much best suspended, that is, the seed sown on baskets, and in just such a snug place as already mentioned. A most important thing is to always keep the surroundings in a very moist condition, in fact, at all times near the saturation mark.

In regard to watering always keep the seed bed in about one condition, never dry, and never saturated, but strive for the happy medium. I always handle my seedlings just so soon as the time can be spared, putting cypripediums into thimble pots, which are prepared a few days before using, and cattleyas, etc., into small baskets specially made and treated some days before using. Place the small seedlings in much the same position as where the seed was sown, that is, in a nice, genial position, and never on any account let them become dry or it will be fatal to them. HENRY T. CLINKABERRY.

FERTILIZATION OF ORCHIDS BY INSECTS, AND THEIR MIMICRY.

The above title formed the subject of a popular lecture, delivered before the horticultural section of the American Institute, New York, by Mr. C. H. Atkins, on Wednesday evening last. Mr. Atkins illustrated his lecture with a large number of drawings and diagrams, and plainly portrayed the existing relations between orchid flowers and insects; the one being, homologically, the half of the other. He pointed out, from their structure, and the arrangement and situation of the reproductive organs, the utter impossibility of self-fertilization, and said they would forever remain sterile if this function were not performed through the intervention of insects.

The lecturer graphically described the various complex adaptations and contrivances by which this ultimate was obtained. Cattleyas, cypripediums, coryanthes, catasetums, angraecums, vandas, pterostylis, habenaria and many others were handled in great complexity of detail, depicting to his audience the different kinds of bees, birds, moths and flies that were specially adapted to fertilize these flowers in a state of nature. The use and value of the highly metamorphosed labellum was explained; the chief colors being usually concentrated in this

wonderful organ, and being situated immediately in front of the column, offered itself as an attraction and landing place for insects.

Mr. Atkins, in his remarks on orchid mimicry, exhibited drawings of such popular flowers as Peristeria elata (dove orchid), Odonto grande (baby orchid), Oncidium papilio (butterfly orchid), Cycnoches ventricosum (swan orchid), Aceras Anthropophora (man orchid). Flowers of gongora look like a swarm of sand wasps and emit a powerful odor of violets in the early morning, when the sand wasps are at work; this perfume entirely disappears before noon, the sand wasps going to rest before the middle of the day. Heads, wings and a host of other insect appendages being ably described; and all had their significance in attracting insects. These were not fancied resemblances, all being so faithfully depicted that even the most casual observer distinguished them at a glance.

MISCELLANEOUS SEASONABLE HINTS.

Sowing Seed.

The time will soon be here when many important flower seeds should be sown. We will hope that you have sown lobelia, petunia, verbena, centaurea and a few other sorts that want an early start. From the first to the tenth of March is about as early as the following can be sown. If sown too early the young seedlings demand more room than you can profitably give them, and you will not have an inch of space to spare before Easter (April 10th). Asters, for instance, if sown early in March, will, if kept in the full light and cool, do no harm in the seed pans or flats till early April, and then they will do finely in a mild hotbed or even cold frame if protected from frost and transplanted into other flats.

Sow asters, Phlox Drummondi, ten week stocks, dianthus, balsams (end of March), cosmos, nasturtiums, zinnias, calendulas, marigolds, chrysanthemums (the annual), mignonette, for selling in pots. There are also maurandya, lophospermum and thunbergias which you will want for baskets; no harm to sow the three latter at once. You may want to grow amarantus, perillas and celosias for the flower border; sow them early in March. Balsams, nasturtiums, amarantus and celosias are warm blooded plants, and nothing like a frost must approach them.

Mignonette does not like its roots disturbed and bears transplanting poorly; so we sow it in 2-inch pots, a few seeds in each. When two inches high you can shift into a 3 or 4-inch, and a hotbed is the place to make sturdy little plants. This favorite can be sown out of doors in the border, where it is to bloom, as you would candytuft, nemophila and many other annuals, but we find many customers who think nothing of their garden till the end of May, and then they want a show at once. So we find pots of mignonette wanted just as much as we do lemon verbena, or any other favorite for the mixed border.

The nasturtium, maurandya and lophospermum we use for baskets and vases, and when well up put into 2 or 2½-inch pots. The last two you want to grow vigorously and attain a good size. The nasturtium grows too rampant, and if growing too strong is slow to flower, so a poor soil, a warm, dry situation, and a little thirst for water will be best.

Cobea scandens, there is always a demand for a cheap summer climber, sow the middle of March. When once it begins to grow it is two feet long in no time, falls down and gets entangled and makes a lot of growth which is unmanageable and a nuisance, so don't be too early. The way to sow cobea, to get 100 per cent of the seed to grow, is to place the seed on end and press into the wet soil till it is almost out of sight. If you don't know the right end to put down you had better be safe and place the seed on edge, pressing the thin seed into the soil. Don't keep the soil too wet or the seed may rot.

I sow all seed in our tulip flats which are 2 ft. by 1 ft. and 3 in. deep. Two inches deep would do just as well if you have them. Many a time an honest seedsman gets abuse because his seeds did not germinate. I dare say many of our leading seed houses could show many a valued testimonial saying: "Your chine oyster was no good." Sowing seed, particularly very minute seed, is a delicate operation, and, although not mechanically difficult to learn, wants great care, and so do these flats or pans before and for a week or two after germination require great watchfulness. Most any greenhorn can put cuttings in the sand if he can draw a straight line, and if it is not straight the cuttings will grow, but yourself or your superior should sow the seeds.

A good plan to follow is this: Supposing you use flats of 3 inches in depth; put some coarse soil or manure in bottom, then fill in with sifted soil to within one-half an inch of the top, press evenly and moderately firm and see that the surface of the soil is about level; if not, when watered, the low spots will get a soaking at the expense of the higher ones. Then with a rose on the watering pot or hose, give the flats a good soaking and let the water drain away. In a few minutes the surface will be in good condition to receive the seed. As a rule, thin sowing has much to commend it. It takes more room, but the plants are so much benefited by having room to spread, while if crowded, they draw up spindling and weak, and if you should be delayed in transplanting, or, as we call it, "pricking out," will be well on the road to ruin.

How deep to cover seeds is a question often disputed, and no infallible rule can be laid down. The oft-quoted rule to cover to the thickness of the seed would undoubtedly be a good enough rule, but impractical. For instance, who would cover a sweet pea with but an eighth of an inch or a cabbage with the sixty-fourth part of an inch; and again, how is it possible to cover calceolaria to the depth of its own size? A mere press into the soil for these very fine seeds is enough. If asters, stocks and such seeds are covered evenly out of sight it will do.

After covering evenly with sifted soil of a light texture and again pressing down evenly, a very light watering will do, as the soil has been already well wet. This is an important point, for if you had to water sufficiently to wet the soil through, you would likely have washed the seed to one side or the other. Cover with newspapers or some shade till the seeds have started, but as soon as they are up they want the full light. Never let the seed boxes get parching dry, for you may lose many young plants by so doing. No harm in starting any of the seeds I have mentioned in a night temperature of 60 degrees, but as soon as above the ground remove to a temperature that you know is congenial to the plant while under glass, which, for instance, with asters, stocks or dianthus is at least 10 degrees lower.

WM. SCOTT.

SEEDLING CHRYSANTHEMUMS.

In reply to your correspondent, H. C. H., I would say that plants needed for the purpose of hybridizing are easiest to handle if grown in pots. They should only receive just enough feeding to keep them in good health, because when plants are fed heavily to get good flowers they are necessarily gross and bloated and the reproductive organs are subordinated to length and breadth of the petals. The best results are obtained when the plants are grown hardy, but perfectly healthy.

Keep the best flower on the plant to be retained as the seed bearer and remove all the others. Then, when the flower is fully developed, cut off with a pair of scissors all the petals down to the stamens, stand the plants together that are to be crossed and keep the atmosphere dry and moving. If the weather is bright a fine camel's hair brush used on two successive days in conjunction with plenty of air will be sufficient to insure pollination. In dull weather it is better to take the pollen on the end of a pointed match stick and touch the stamens with it. The operation is tedious, but effective.

After fertilization gradually dry off the plant and keep in a dry atmosphere till the seed is ripe. Black fly must be kept away from the flower and a little sulphur dusted over it is beneficial. The seed can be sown in March or April in nice light soil and placed in a temperature of 60 degrees with just a little bottom heat. They will germinate in a couple of weeks or less and the young seedlings should at once be pricked out and gradually hardened off. They can be planted out and grown straight ahead and left pretty much to shift for themselves the first year. Seedling mums are very interesting, but they are no Klondike, and if H. C. H. gets even one or two good things out of his batch he is lucky; so very, very few stand the test of time. How dear to my heart are the "mums" of my childhood, but they have gone the way of all flesh.

Indiscriminate crossing is useless. The operator should start out with a definite object in view and hang on to it. By the time the returns are all in and the seedlings have all flowered there may be nothing else left to hang on to, "but that's another story." For instance, let him take Bonnaffon and cross it with, say Modesto, to improve the color and so on. This will give better results than getting two or three different colors mixed up trying to strike a good combination. Strive to get a good pink. There is plenty of room for it. The better breed the parents the higher type should be the children. Onward and upward is the cry of the hybridist. C. TOTTY.

BOUGAINVILLEA GLABRA.

How shall I treat Bougainvillea glabra to have it flower well? Please give both summer and winter treatment, time to prune, etc. My plant is several years old and is trained against a brick wall. Some branches are over ten feet long, but the plant has produced few flowers. It is planted in a small tub, temperature 60 degrees at night. SUBSCRIBER.

The natural time of flowering is in June, July and August. The flower proper is but an inconspicuous affair; the bracts, as in the poinsettia, are the gay attraction. After the bracts have fallen, which is usually in November, a rest by withholding water (not drying up, but keeping on the dry side), till February will best suit the plant. In February the shoots can be pruned back and the weak ones cut out. Begin to water more freely and with the increased heat of spring they will make growth and flower freely. It is well that the plant is in a tub, as there is a limit to root room. When given unlimited root room they make a strong growth with less tendency to flower. By resting earlier in the fall and starting earlier in winter the flowers would appear as early as April and May.

W. S.

RATS AND MICE.

How can I get rid of rats and mice? The little field mice are particularly troublesome. They climb up on my carnations, bite off the flowers and when they reach the ground chew away the inside of the calyx and the lower part of the petals. I have tried a number of remedies, but have so far failed to succeed. N. Z.

I have been a fellow sufferer this winter with our friend from the depredations of rats and field mice. The latter are much the worst, for the reason that the rats will eat poison when tastefully and pleasantly administered, but the mice prefer a diet of green stuff and will only touch the poison in the way of dessert. These field mice are perfectly distinct from the little, sharp-nosed, long-tailed rodents which make a restaurant of our cupboards and pantries, and which cause the petticoated part of our family to forget age and decorum and spring with agility to the top of the nearest chair or table. I once knew an old maid who ran screaming to the house if a butterfly was encountered in her walks in the garden. The mouse scare is about as absurd.

The field mouse has a short tail, stub nose and is much heavier than the house mouse, and more resembles the mole in size and habits. It prefers the leaves and stems of carnations, violets and even lettuce, to a sardine sandwich or Stilton cheese. A good cat is the best cure for rats and mice, but in the absence of pussy get two ounces of arsenic and thoroughly mix it with half a pint of corn meal. Don't put this in an elaborate dish tied with a ribbon, but just drop a little round here and there in a careless way; on the edge board of the bench is a very good place. It is an excellent plan to put a little of the pure meal down the first night in the way of a "jollier." They will taste it, approve of its quality and eat it up, and the next night, lo the end approaches. Arsenic produces a frightful thirst, and to use the language of an old rat poison peddler whose little speech has been repeated ten thousand times and came out automatically when he opened his mouth, "They eat the poison, go to the water and drink and burst." Within three weeks I have followed the plan recommended and found both field mice and rats dead close to where they could get at water, and from their corpulency they had evidently imbibed, having the appearance of just departing from a New York florists' smoker. W. S.

WATER SUPPLY.

I want to build a greenhouse this season, and as I am beyond the line of city water supply, I would like to ask the cheapest way of heating it without water. ENQUIRER.

We would not advise "Enquirer" to heat by any other system than hot water or steam, and the place would be too small to apply steam. However small the place would be, you would need water for the plants, and if your hot water apparatus is properly constructed, pipes screwed together tight and no leaks, it will use no more water than a dozen geraniums would need to keep them in good condition. Don't try to heat with that obsolete method, a brick flue. The cost would be as much as the hot water pipes, and you are always in danger of fire, and would be debarred from that great blessing, insurance in the "Florists' Fire Insurance Association."

When you have settled on length, width, height and shape of your projected building, send a sketch to the editor of The Review and you will get up-to-date advice on how to heat it.

W. S.

THE FLORISTS' REVIEW

G. L. GRANT, EDITOR AND MANAGER.

PUBLISHED EVERY THURSDAY BY

THE FLORISTS' PUBLISHING CO.

530-535 CAXTON BLDG., CHICAGO.

Subscription, $1.00 a year. To Europe, $2.00. Subscriptions accepted from those in the trade only.

Advertising rates: Per inch, $1.00; ½ page, $13.00; full page, $25.00. Discounts: 6 times, 5 per cent; 13 times, 10 per cent; 26 times, 20 per cent; 52 times, 30 per cent. Discounts allowed only on consecutive insertions. Only strictly trade advertising accepted. Advertisements must reach us by Tuesday to assure insertion in the issue of the following Thursday.

COPYRIGHT 1898.

CORRECTIONS.

A number of errors crept into our last issue. The most unpleasant one was the substitution of the wrong engraving for the proper one of Livistona Hoogendorpii, but there were others. On page 428, in the "Story of an Emigrant Florist," referring to Dendrobium densiflorum, it should have read: "What a pity it and thyrsiflorum last so short a time," and not Wardianum, the latter being an excellent keeper. And the title under the engraving on page 426 should have been Physalis instead of Phylasis.

AMERICAN CARNATION SOCIETY.

Officers.

President, W. N. Rudd, Mt. Greenwood, Ill.; Vice-President, Fred Dorner, Jr., Lafayette, Ind.; Secretary, Albert M. Herr, Lancaster, Pa.; Treasurer, Chas. H. Allen, Floral Park, N. Y.; Executive Committee, the above and Wm. Scott, Buffalo, N. Y.; Eugene Dailledouze, Flatbush, N. Y.; W. R. Shelmire, Avondale, Pa.

Seventh Annual Meeting.

The seventh annual meeting will be held at Chicago, Thursday and Friday, February 17 and 18. Headquarters will be at the Auditorum Hotel, where the meetings and exhibition will be held. A special rate of $3 a day on the American plan and $1.50 on the European plan, has been secured from this hotel, which is the finest in Chicago. Rooms may be secured in advance by addressing the chairman of the local committee, Mr. P. J. Hauswirth, 318 Wabash avenue. Mr. J. T. Anthony is superintendent of the exhibition. He also may be addressed at 318 Wabash avenue.

NEW CANNAS.

Messrs. A. Blanc & Co., Philadelphia, have issued a very attractive colored print of their new cannas, including the varieties Topaz, Maiden's Blush, Duchess of Marlborough, Duke of Marlborough, Champion, Klondike, Brilliant, Lorraine, Victoria, Triumph, Cuba and Golden Pearl. It is a very interesting collection.

PHILADELPHIA.

Effect of Weather on Business.

The weather during the past week has been what the daily papers call "old fashioned winter," which means to the growers an amount of labor and expense perfectly appalling. Not only did coal disappear with marvelous speed, but the quantity of flowers cut was entirely too small to meet this extra expense, in most cases at least. Fortunately the end of the week saw a change and while clouds and rain can rarely be called a welcome change, still in this case it certainly was welcome to many a grower, for with it came a rise in temperature.

Business continues brisk. It always seems to have an added snap when it snows. The extreme cold has kept the supply down and prices remain firm. Plant trade has been greatly hampered; whenever possible orders have been held for warmer weather.

The Florist Club.

The meeting of the Florist Club on Tuesday brought out another group of the newer carnations and most attractive they looked arranged on a center-table under the light. R. Witterstaetter, Sedamsville, Ohio, sent Evelina, which carried well. Fred Dorner & Sons, Lafayette, Indiana, sent White Cloud, also in fine condition. The debutantes, so to speak, that received the most attention because least known were Frank Nequet's Maud Adams, from Patchogue, N. Y., about which the New Yorkers have said such complimentary things, and Charles H. Fick's seedlings, especially a white, which measured three and a quarter inches in diameter.

The color of Maud Adams reminds me somewhat of John Thorpe's old time seedling, May Queen; it appeared to be a sort of cherry color by artificial light. It seems strange that this color should become popular. I very well remember that when selecting my first carnation plants for growing for cut flowers, the robust habit of Sunrise, an old time sort, tempted me to buy three hundred. They bloomed early so that when carrying the first basket to the commission man, it contained nearly one half Sunrise. "This is no use," he said, picking up a bunch of that variety; "grow two-thirds white, one-third red, nothing else!"

The Stores.

The stores are devoting much attention to their show windows and very tastefully many of them are arranged. "Transient trade," Mr. Cartledge once said, "is the best." That the wide-awake retailers thoroughly realize the importance of this class of business is shown by the pride they take in having rich and striking displays, frequently changing to something else. It is a great pleasure to mark what an acknowledged power the leading retailers are becoming socially. Perhaps this little incident will best illustrate my meaning:

Not long ago a lady was arranging the details of her niece's wedding. A family conclave assembled to decide what flowers the bride should carry; it must be something choice and beautiful. Finally the lady decided on rose Souvenir du President Carnot and Cattleya Trianae made into a shower bouquet. "The Carnot will look nearly white and the orchids will add color," she said. This decision was communicated to the retailer, who was to make up the bunch. "Is the lady a widow?" he asked. "Certainly not." "Then it will not do," he said. "I would suggest either Bride roses and lilies of the valley together, as Lapageria alba is not now in the market, or Brides alone or lilies of the valley alone. The bunch should be white." And white it was of Brides and valley. What a contrast to the days when the caterer ruled the florist and made him always put smilax on the table.

Notes.

The bowling team won their match game this week in fine style. Their score is now, won three, lost three, with bright prospects of improving their position in the race.

"Mr. X.," one of our prominent retailers said, "is the best raiser of roses I know; they were five cents yesterday and ten today."

I wish to correct an error. In my last letter John Burton, not Myers & Samtman, grows Beauties in solid beds; Myers & Samtman's high even span house has tables. J. W. Y.

CLEVELAND.

Cut Flower Situation.

We have just come through the coldest and most long continued spell of frigid temperature that has occurred this winter. Although the mercury got well down into the bulb and gave us a taste of below zero weather, yet we have had clearer and sunnier days than at any time previous since early last November. The consequence is, that while there may have been some slight temporary check to the supply, yet the quality is already somewhat improved and later cuttings will show more. Flowers continue in none too plentiful supply, not even bulb stuff being as yet overdone. It is to be hoped that this feature will continue throughout the season, although anything quite so good as that would be, is a little too much to expect.

Roses are still rather short in supply, although the quality is very good, with only a very small percentage of second grade flowers. The crop with many growers is now at its lowest point and every day from now on will

tend to increase the supply. Carnations, violets and other flowers continue to jog along at their accustomed gait. Harrisii are still short in supply and are very likely to continue so as the season advances.

A Trip to Mentor.

The writer took a trip out to Mentor lately for the purpose of visiting Merkel & Son's and Carl Hagenberger's establishments. Merkel & Son's greenhouses were found in their customary good shape. The houses devoted to small ferns and palms were full of fine young stock in excellent growing condition. The houses devoted to roses were looking particularly well. One hears a great deal concerning carrying over roses for a number of years—a proceeding usually decried, especially where the roses are on raised beds. Yet here all the stock is grown for a number of years and on raised benches at that, most of the plants having been put in three years ago; yet nothing could look better than they do.

The carnation houses were in good condition. A number of seedlings show evidence of considerable promise, one in particular, somewhat like Scott in general appearance, but very much larger, looks like a good thing. There were also several scarlets of various shades that look well if they do not go back later, after the pleasant fashion of carnation seedlings in general. One thing not often seen was a batch of Asparagus plumosus in seed. There is an impression quite general with many, that this variety does not seed, at least without artificial aid. This stock has been allowed to pursue nature's course throughout and the strings are heavy with berries in all stages of development. Many thousands have been gathered and sold, and there are many more thousands still to come.

One house of violets is grown, mostly Marie Louise, with one bench of Princess of Wales. They all look well, quite the best that the writer has seen for a long time. Princess of Wales is a fine grower and bloomer, the flowers being large and of fine color, with good stems. One very good feature of them is, that instead of the petals being so much reflexed as in the California violet, they stand straight out, making a fine, bold flower almost round in form, reminding one rather of the shape of a pansy than of the conventional single violet.

Carl Hagenburger makes a specialty of bedding stock and carnations. The stock was looking well throughout and in a batch of seedling carnations some very novel specimens were noticed. One in particular was very odd. It was a bright yellow, with broad stripes of dark red through the petals. The flower owing to great contrast of colors and the breadth of the stripes, had a peculiarly bizarre appearance. Should further propagation and growing fix the character of the bloom it would certainly make a novelty.

Seen from the Car.

On the trip out, the writer forgot to mention that the grounds of the Cushman Gladiolus Co. were passed. High up on a side hill a man or two, under the superintendence of Mr. Cushman, were at work prying at something in the ground. As the car sped by, all hands could be seen prying away for dear life. Suddenly the tools slipped and all hands with surprising unanimity, sat down without seeming to select any particularly desirable spots for performing the evolution. There was at first some idea that the movement was some new method of saluting the occupants of the passing car, but further consideration leads one to think that the indefatigable Mr. Cushman was only getting out an unusually large gladiolus bulb. Why not try dynamite? NEMO.

CHICAGO.

The Market.

There is little change in market conditions. The promised increase in supply of roses has not yet materialized and the shortage seems as great as ever. Other flowers are in fair supply, and bulbous stock is coming in freely.

The Carnation Convention.

Preparations for the convention of the American Carnation Society are well advanced and everything will be in good trim on time. The exhibition will be held in the banquet hall of the Auditorium Hotel and the meetings in an adjoining club room. Remember that the convention opens the morning of next Thursday (Feb. 17). The local florists should be on hand in force to greet the visitors.

The banquet will be held at the same hotel, beginning at 7:30 o'clock Friday evening (Feb. 18). This promises to be a most enjoyable event. All florists are invited to attend. The local people will be expected to pay for their own plates, and the tickets are $3 each person. Those who will attend are requested to notify the chairman of the committee, Mr. P. J. Hauswirth, 318 Wabash ave., so the committee may know how many to provide for.

A bad Fire.

Wednesday night of last week the greenhouses and stock of Messrs. Felke & Miller, at Wilmette, were almost totally destroyed by fire. The range of glass contained about 50,000 feet and the loss is a serious one. There was no insurance. It is suspected that the fire started from some tobacco stems which had been wet and frozen and placed on the boiler to thaw, and then forgotten. In his attempts to put out the fire when first discovered, Mr. N. Miller, Sr., aged about 70 years, was quite seriously burned and may lose his eyesight in consequence.

Various Items.

Mr. John Zeck, of Reinberg Bros., is confined to his home by an attack of rheumatism.

Harms & Lang have dissolved partnership, to take effect March 1. Mr. Lange will continue the business on his own account.

Florist Mueller, of Morton Grove, is reported to have made an assignment.

Walter Kreitling says he is still in the ring, even if he has been confined to a diet of fried snowballs.

This Thursday evening is "Retailers' Night" at the Florists' Club, and the meeting will undoubtedly be a very interesting one.

TORONTO.

Market Conditions.

No one can complain that old probs. has not been giving us plenty of weather this last week. There were, however, a few hours' sunshine mixed in with it, which did some good while it lasted. Roses and carnations have come on very slowly, barely keeping up with the demand, in fact, carnations have not done so. Violets, however, are plentiful and in good demand. Dunlop has two houses of them in very fine crop now and very healthy looking; they are worth looking at.

Society Meetings.

It was too cold and stormy for the crowd to get out to the regular meeting of the Horticultural Society last Tuesday. A few ladies, however, attended in spite of the weather, and about 25 of the male sex, mostly professional. Mr. J. McP. Ross, the new president, took the chair for the first time and there is no doubt, judging from experience of his genial qualities, that he will make a most efficient president. The meeting was very pleasant and interesting, the papers were well written and the discussions lively.

The Canadian Horticultural Association hold an organization meeting here on Thursday, the 10th, and if the weather does not turn too severe again before that time a large meeting is expected. Visiting delegates will be invited to the eighth annual dinner of the Toronto Gardeners' and Florists' Association. It will be an event in the history of Horticulture in Toronto.

The executive committee of the G. & F. Association have resolved to recommend at the next regular meeting that the annual fee be $1, payable in advance, that the association adjourn for four months during the summer, that a grand social meeting be held at the reopening in August, that the full prizelist for the chrysanthemum show be compiled and issued as soon as possible, and that the show be held the second week in November.

Messrs. T. Manton and A. H. Ewing were chosen as delegates to the Industrial Exhibition Association, the annual meeting of which takes place on the 15th.

Mr. J. H. Dunlop returned home last week. He reports great success with his new rose Lady Dorothea (sport from Sunset). It certainly is very pretty, as seen growing, and I should think sure to be popular. E.

ST. LOUIS.

Trade Conditions.

Trade for the week just past was good with some of the florists, while others claim it was dull. Still flowers are scarce and for two weeks past really first class stock has been short. Commission men report a great many shipping orders, but can't fill them as the home trade is taking nearly all the flowers that are coming in just now, with the exception of bulbous stock and violets, which are very plentiful and sale on them slow. The ground hog saw his shadow last Wednesday, and the chances are we will have six weeks of bad weather before us, and stock will remain scarce.

Prices—Stock.

Prices are still at the top notch. Good first class Beauties are out of the question in this market just now, but a good many short stemmed ones are coming in and sell at from $5 to $10 per 100. Brides, Bridesmaids and Meteors are selling from $8 to $10 for the best; Perles and Woottons $4 and $5, seconds $2. Carnations are about the same as last week, not over plentiful and are selling well at $2 and $4 per hundred. Henry Aue and F. W. Ude, Sr., are at present sending in the best. Bulbous stock is plentiful. Romans sell at $1.50 and $3; paper whites, same; daffodils, $4; tulips going slow at $2; valley, good, $4; Harrisii, $12.50; callas $10; freesia, $1.50 to $3.

A great many orchids are being used now and will soon become standard stock in this market. Violets are still a glut. A great many of them come from the south and the home grown ones have to stand back, as the southern are sold so much cheaper. The public don't seem to care just so they are cheap. Smilax is plentiful and is selling very slowly at $10 per 100 strings.

Club Smoker.

After the club meeting Thursday of this week the club will hold its annual smoker at the Mercantile club rooms. The committee, composed of Messrs. Beneke, Young and Fillmore, has made all the arrangements to have a good time. There will be plenty to eat, drink and smoke and also lots of singing and funny sayings.

Mr. J. F. Ammann, of Edwardsville, has been specially engaged to sing all the latest songs. Mr. C. W. Wors will sing his new song, "The Wandering Jew; or, Who Stole the Ham." Messrs. Kuehn, Weber, Schray and the Ude brothers will give a cakewalk. Frank Fillmore, by special request, will sing "Annie Laurie." Ed Buechel and Al Bauer will do a song and dance. Dr. Halstedt, E. W. Guy, A. Feher and Henry Emmons, of Belleville, will sing as a quartette. Max Herzog will give his famous Dutch specialty with wooden shoes, and many others will also contribute a few selections.

Mr. Carew Sanders returned home last week after spending a few weeks in Florida.

The executive committee met again last Saturday night and worked on the preliminary list for this year's show. The list will be out by March 1.

Personals.

Frank Ellis, manager of the Mound City Cut Flower Co., who has been sick for the last three weeks, is out again looking as good as ever and ready for work.

J. S. Wilson, with J. C. Vaughan, Chicago, is in town. Jim came to St. Louis to see his brother Alex and Charles off for the gold fields. Johnnie Connon, a cousin of the Wilson boys, and Wm. Lingenbrink, went with the party. They left Thursday night last. Good luck to you, boys.

E. W. Guy, of Belleville, and Chas. Kuehn spent a day last week with the Ude brothers at Kirkwood. They report that they found everything in good shape and stock looking at its best. The Kirkwood boys are getting the bowling fever now, as they say they are going to build an alley of their own.

A firm under the name of Etoile & Co., 921 Olive street, with Fred Foster as manager, has opened up a floral establishment. The card reads that they have branches in London, Paris and Algiers.

Bowling Notes.

The Bowling Club on Monday night rolled its usual three games of tenpins after a rest of four weeks. Capt. Wilson, of the Chicago Bowling Club, who is in town, rolled with the boys and made 494 in three games. Among the club rollers Beneke was high man in the three games with 588, single high score 246; C. A. Kuehn second with 560, single score 221; and E. Schray third with 532, single score 192. Next Monday night Mr. Finlayson will become a member of the club. J. J. B.

CINCINNATI.

Cincinnati Florist Society.

A special meeting of the Cincinnati Florist Society was held on Saturday evening, Feb. 5th, with a good attendance. President Witterstaetter in his opening remarks, stated that the meeting had been called for the purpose of making final arrangements to attend the convention of the American Carnation Society at Chicago, and that he hoped every one who could possibly spare the time would join in the proposed trip. Mr. E. G. Gillett was appointed a committee of one to secure cheap transportation. Our party will leave here on Feb. 16th at 8:45 p. m. over the C., H. & D. railroad. All those from neighboring towns wishing to join the party can secure particulars by writing the secretary of the society, Mr. Albert Sunderbruch was instructed to correspond with the manager of the exhibition and secure space for the Cincinnati exhibit. Thus far about twelve have signified their intention of going, and it is to be hoped that this number will be increased. Mr. J. M. Gasser, of Cleveland, was present at the meeting.

The weather during the past week has been the best we have experienced for some time. The bright sunshine has given new life to the poor plants and instead of a good crop of black spot we will soon have a more profitable product in the way of roses. Roses and carnations show a slight improvement, both in quantity and quality, although the supply of the former is still somewhat limited. The prices on all stock remain about the same as quoted last week.

The past few weeks has proved that Messrs. George & Allen can produce roses just when they are wanted as well as bulbous stock. The commission men have had to depend almost entirely upon this firm for their supply since Christmas.

Henry Schwarz is quite busy getting his houses in shape after the storm.

G. Brunner's Sons continue to bring in the best Marie Louise violets grown in this vicinity.

Alfred Knopf, of Columbus, O., was a caller last week. B.

BALTIMORE.

Stock Scarce.

It was indeed a limited supply of stuff that found its way to our commission houses this week; owing chiefly to an unusually cold spell, which for our climate could be termed a veritable blizzard.

Decorations.

Entertainments have been numerous, but the cold weather (having driven pedestrians off the streets) greatly affected the transient trade. In the store windows can be seen quantities of bulbous stuff, such as tulips, narcissus, Duch hyacinths, jonquil, etc., with a lot of the usual flowering stuff, among which the genistas and acacias are new arrivals.

The writer recently had the pleasure of seeing a very tasty and unique afternoon tea decoration of palms and blooming stuff. Besides the usual mirror and corner effects a special feature of the work was a high bank of palms, ferns, azaleas and lilacs, interspersed with Harrisii lilies and swainsona, forming a semicircle through the doorway from the parlor to the hall.

Messrs. H. Weber & Sons, of Oakland, and Woodfall Bros., of Glennburny, are both shipping choice carnations the past few weeks, of which Helen Keller are exceptionally fine specimens.

Various Notes.

On Jan. 28, Mr. Jno. Cook, of Old Frederick Road, was robbed of four of his valuable rose seedlings. The thief is thought to be a workman who was in Mr. Cook's employ for the past five months and who, on the above named date, absconded. Several articles of apparel belonging to his fellow workmen have also disappeared with him.

The Baltimore correspondent of The Florists' Exchange was in error when he stated that at our last club meeting President Pentland considered that paper "the best trade journal." Our president did, however, praise the Exchange, and also said that up to the advent of The Florists' Review he had given the first mentioned paper the preference of the field. The writer agrees with Mr. E. A. S. that "facts are stubborn things," but he also thinks it would be wise not to jump too quickly at conclusions. The subject being merely a personal argument and not a club matter, the trade paper correspondents were requested by the chair not to make any note of the discussion. The club highly appreciates the complimentary courtesies which the several trade journals have extended towards them and it is not the wish of the organization to offend by making a distinction.

It was with great regret, on the 3rd inst., that the craft learned of the death of Mr. Ed Davis, late vice president of the Franklin Davis Nursery Co. of this city. C. F. F.

NEW YORK.

On the Street.

Up to Friday of last week our friends the wholesalers wore "one grand substantial smile," and now today, Monday, they are as blue as an editor's pencil, and a glut of stuff in sight. Of course it is understood that when a wholesaler is blue trade is bad. Last Saturday the market went all to pieces and it had not recovered up to this writing. The day has not been yet though when the demand exceeded the supply, though up to Friday it approached that mark nearer than any time this winter. Now, with little demand, there is more stuff, which reminds me of the farmer who took boarders when he ought to have planted corn and planted corn when he ought to have taken boarders, but then it was ever thus.

The new crop of roses is coming in and Lent will soon be here. Very little change in prices so far, though this week will see a big drop I am sure. Carnots and Kaiserins are exceedingly scarce, the fancy grade selling from $1.50 to $2 per dozen. Beauties still continue scarce also; there is very little demand, however, and the majority are shipped.

There is a tremendous glut of bulb stuff and prices are almost what you can get. Valley still remains inactive and Von Sions are a drug.

A few Coelogyne cristata are making their appearance and sell at $5 per hundred; Dendrobium formosum giganteum, 12c to 15c, and a few fancy "cyps" at 12 cents. The glut of cattleyas seems about over and next week I expect to see the price stiffen on this commodity.

Next Saturday is Lincoln's birthday, a legal holiday here now, and if the weather is good, from a wholesaler's standpoint, it ought to help the market a little, more specially violets, which sadly need a boost.

Our Special Wholesale Report.

Signs are not wanting that point to a larger supply of all kinds of stock; fairer weather and shipments slowly increasing. Roses and carnations have stood still for the last month and now only need some sunshine to bring them out, and it looks as though we were going to get it.

Trade was not brisk, but good enough to consume all the best stock up to Friday, when the demand fell off, and on Saturday there was a frost. It seemed as though the bottom had fallen out entirely. High prices have prevailed on the choicest roses, but inferior stock was in limited demand.

The quality of Maids and Brides was never better, nor has there been so much fancy stock in the market before. Cusin, Morgan and Testout, when good, were sold at good figures. Beauty is generally poor, with the exception of the long stems, and the supply of the latter is still light, though there is considerable of an increase in the cut of short sizes. There has been sale for all the good Brunners received.

Carnations are in good supply; prices steady on good stock, but the poorer kinds are not wanted. The severe weather affected violets to the extent that the bulk of them were carried along until the latter part of the week, when they sold at low figures. Some low prices have been taken for valley, as it is still abundant, the price seldom exceeding $2 per 100, except for occasional small lots, $1.50 is nearer the average. Cattleyas still hang, and prices vary from 20 to 40 cents.

There is a full and sufficient supply of Harrisii. Tulips, narcissus and freezias are to be seen all over, and sales are made at a price to suit the buyer. Lower prices may be looked for this coming week on all grades of roses.

Seed and Bulb Trade.

The weather of the last week put a severe check on the seed business. Snow has fallen very deep in all sections, especially in the New England states. It is only temporary, however, and the "wheels of progress" will soon revolve again. Spring bulb trade is commencing to rear its head and there is a general movement of stock in this line.

Mr. E. M. Parmlee, Picton, Ont., and D. C. Day, representing J. Chas. McCullough, Cincinnati, were both callers on the trade during the week.

The Retailers.

Outside the ordinary society functions there has occurred nothing extraordinary or that would materially affect the market. The Arion ball at the Madison Square Garden was taken care of by Hanft Bros (that is, the decorative section), and was fully up to the usual standard. However, but few flowers were used, "heavy greens" being handled chiefly, and "tinsel."

I cannot but help notice the window of J. H. Small & Sons whenever I pass. It is never elaborate, but always looks rich and aristocratic. To-day there was a border of selaginella around the edge of the window, then a bank of adiantum, out of which stood well flowered azaleas and vases of Acacia pubescens and sweat peas. Suspended from the ceiling were baskets of pretty Davallia bullata draped here and there with strings of asparagus.

Various Notes.

Mr. S. C. Nash, of the New York Cut Flower Co., has returned from Florida, where he has been on a vacation. He had a very narrow escape on his way south, an accident occurring to the train he was on whereby four people were killed.

BUFFALO.

Flowers Plentiful.

The blizzard which covered the country for four or five days made business very dull, although we were by no means hampered in getting our supplies, and there was no lack of flowers of any kind. Alas! it was the customers that were not in supply. Ladies don't wear violets on the street when it is 5 degrees below zero and the wind blowing forty miles an hour. They think more of flannels, etc., etc. 'Tis just, and balmy breezes are here again and immediately there is a revival of business.

Flowers of all kinds are plentiful and of A 1 quality; prices moderate. Tulips and daffodils are selling quite fairly. Last year we did not have enough scarlet tulips; this year we have too many. Now everybody wants pink. Some fine La Reine have filled the bill and some very fine Rose Grisdelin are still better. Carnations hold their own, but vary in price, which they certainly should for Jubilee, Pingree, Flora Hill, and more particularly that pure white beauty Genesee, should be worth more than Scott, Daybreak, Portia or little Humpty Dumpty Alaska.

Few Entertainments.

Few events calling for any elaborate display of flowers, either joyous or funereal, have happened of late. Worthy of mention, however, was an event occurring on Saturday evening last. It was the wind-up of the "House Committee on Interstate and Foreign Commerce." They came at the request of our congressmen to consider the advisability of connecting the mainland of the state of New York with Grand Island, situated in the middle of the Niagara river. The island is fourteen miles long and seven broad, so it is worth connecting, especially to those who own land on this island. It will be a mammoth bridge, and is strongly opposed by the residents of the second largest lumber city in the world, situated a few miles further down the river. But this is not floriculture. The committee did not promise to report in favor of the bridge, but that did not prevent them from partaking of refreshments on numerous occasions during the day. In fact, the frequency of the irrigations would lead one to think it was July.

It wound up with a banquet at the Ellicott club rooms, largely attended by representative citizens. What was there in floral work was well described in a daily paper and is, I think, more likely to be correct than the average attempts of that sort. Joseph H. Rebstock was the artist, and it did him credit. If Toronto is ever joined to their island by a bridge and they have a banquet before it is built, here is a model for Mr. Tidy or John Dunlop, or whoever may be the fortunate one.

When the guests gathered at the Ellicott Club at 8 o'clock for the banquet tendered by the City to the visiting committee, they found on the center-table in the reception room, a representation of the coveted Grand Island bridge in flowers. It was about six feet long and four feet high. The abutments were of white and pink carnations. The roadway and approaches on the Buffalo side were made of roses and carnations and violets and lilies of the valley with the word "Buffalo" in purple cording on the approach. The Grand Island approach and roadway were of pink carnations with roses and lilies of the valley and the words "Grand Island" in purple cording. The bridge span was of pink and white carnations. Two blue and two white incandescent lights burned, one at each corner of the bridge. The parapet was trimmed in smilax. A red light gleamed underneath the bridge and soft green leaves represented the water and the land. The House committee admired it greatly and it certainly was a beautiful embodiment of the bridge project.

Carnation Society Meeting.

I know of two at least of our townsmen who will attend the Carnation Convention in Chicago the 17th. If there are any New England men going, we shall be glad to know of the fact, for we might get aboard the same train, and there is no better way for New Yorkers than via the N. Y. C. & H. R. and Lake Shore. If the display is anything like the one in Cincinnati last year, it will be worth a long journey. We shall miss the pentrating treble of Mr. Giesy, and it is to be hoped that the secretary has found a use for the domestic piece of furniture presented to him last year. But if all these things have failed, the president of the society is well worth seeing, and so is that city where growth is unparalleled in the world's history—Chicago. W. S.

BOSTON.

Mass. Hort. Society.

At the meeting of the Massachusetts Horticultural Society last Saturday appropriations for the year were made and considerable routine business disposed of. At the suggestion of President Appleton, a committee of five was appointed to give special attention to the preservation and improvement of the woodlands of Massachusetts. Seven applicants for membership in the society were duly elected.

At the weekly exhibition Mr. Carl Blomberg, gardener for Oakes Ames, exhibited 61 vases of orchids. Among them were noted Cattleya Trianae in variety, C. speciosissima, C. labiata, Laelia harpophylla, L. anceps, Coelogyne cristata, Odontoglossum Roezlii-alba (a very charming species), Dendrobium Wardianum, D. Devonianum, D. crassinode, D. c. Barberianum, D. nobile, Cypripedium Bellona, C. Calypso Oakwoodensis (a very fine variety), C. Dayanum, C. Lathamianum aureum, C. Germinyanum, C. Lynchianum, and a fine variety of C. villosum. For this exhibit he was awarded first prize.

Wm. Nicholson, South Framingham, staged 13 vases of carnations and received first prize. M. A. Patten, Tewksbury, showed 16 vases of flowers that were also very fine, and which received second prize. E. A. & W. K. Wood were awarded a gratuity for two vases of E. A. Wood and Ferd Mangold.

Mrs. E. M. Gill exhibited 13 vases of cut flowers, among which were Oncidium flexuosum, Lycaste Skinnerii, and a variety of clivia. First prize for violets went to Alex McKay, gardener to David Nevins, second to W. C. Winter. James Comley displayed 50 vases of camellias, for which he was awarded both first and second prizes.

There was a large and interesting display of vegetables and quite a number of prizes were awarded in this section.

Correction.

In my report of the carnation exhibition at the flower market I was in error in stating that the new white carnation Genesee was staged by Mr. Wm. Nicholson. It was sent here by Mr. D. B. Long, of Buffalo, N. Y.

A Heavy Snow Storm.

During the past week New England was visited by one of the heaviest snow storms during nearly 40 years, and there was considerable damage to greenhouses by the great weight of snow on the roofs. Suburban trains were blocked and traffic in the city was largely suspended. Practically no flowers reached the wholesale houses from Monday till Wednesday morning, but there was no demand to meet as purchasers could not get downtown. Warren Ewell, of Dorchester, had one house cave in, but most of the stock was saved. M. Aylward, Dorchester, had two houses badly damaged. It will take 75 to 80 boxes of glass to replace the broken lights in the Waban Conservatories at Natick. Others who suffered damage were W. A. Bock, of North Cambridge, and Mr. Dunbar, of Watertown.

The Market.

Trade has been just about the same as the previous week. There is plenty of supply in the shape of bulbous stuff which meets with tolerably ready sale. No alteration in prices this week.

New Store.

Mr. Cohen, corner of Chapman Place and Bosworth street, has taken an additional store on Chapman Place, to be devoted entirely to the sale of plants.

C. H. J.

WASHINGTON.

An Era in Decorations.

The week past has been an era in the history of floral decoration entirely unsurpassed. Never before have so many thousand yards of smilax, hundreds of crotons and thousands of orchids and roses wilted for the glory of effect in evenings shortened by much champagne. The most perfect triumph of the decorator's art was seen last week at the dinner given by the Secretary of the Interior and Mrs. Bliss at the Arlington in honor of the President and Mrs. McKinley. The dining room walls were entirely concealed by foliage and clusters of Marguerites and white azaleas. The center of the room was a glen of ferns in which trees of pink roses and lilacs towered fragrantly. Crescents of purple and green orchids on mounds of ferns and galax, bordered the huge circle about the wilderness of flowers which formed the banquet table. The social calendar for the coming week shows many dinners and social events among the diplomatic corps and will no doubt eclipse the week just closed.

Among the Retailers.

The retailers report good business. They have quantities of bulbous stuff on hand, but roses and carnations of A1 quality are scarce. Of tulips red has the lead and is most in demand. Azaleas were never prettier or as well grown as this season, there being some especially beautiful specimens in the windows. Vervaeneana takes the lead and is in great demand.

Some Cattleya Gems.

There may be seen at present in the large and valuable collection of orchids of Messrs. Field Bros. a lovely pure

white form of Dendrobium Wardianum, pure white as to sepals and petals; throat yellow without dark spots, always noticeable in the type. Several pieces of the white Cattleya Trianae may also be seen, as well as a number of the choice and beautiful Cymbidium eburneum.

Prices.

The price list for the week: Beauties, $4 to $9; La France, $1 to $3; Bridesmaids, $2 to $3; Carnots, $3; Kaiserin, $3; Gates, $1 to $3; carnations, 50 cents per dozen; violets, $1 to $1.50; tulips, 50 cents; valley, 50 cents; narcissus, 50 cents; Harrisii, $2 to $3.

The only visible effect left of the blizzard of last week is the great holes in the coal piles, which look as if a cyclone had struck them.

Mr. Wm. Clark had a boiler burst, but Mr. Clark doesn't mind a little thing like that. He is always equal to any emergency, and soon had it going again.

W. H. K.

INDIANAPOLIS.

Club Meeting.

The February meeting of the Indianapolis Florists' Club was held Tuesday evening, Feb. 1. Through the courtesy of the Huntington Seed Co., the meetings will be held in their office room; a lot of folding chairs and other supplies were ordered purchased. The attendance was very good. Four new members were elected, including Park Superintendent Clyde Powers. The conduct of several self-styled florists again came up for discussion, they going so far as to represent themselves as representatives of well known houses when going "crape hunting." This practice has given rise to serious complaint among some citizens and the club felt it its duty to take some definite action. A committee was appointed to get up a "warning" against aforesaid "crape hunters." It was decided to inform the press of the club's action and also to print about 20,000 to 30,000 slips to be distributed where they would do the most good.

Mr. J. J. B. Hatfield read a very interesting essay on "Why We Ventilate." As he is a very scientific man, his paper was full of new things to the average florist. The interest shown in his remarks was very plain, as evinced by the close attention.

A committee of three aged members was appointed to draft resolutions and order a suitable floral emblem on account of the death of Mrs. Allen Lloyd, elected one of the first honorary members of the state and city societies, as was also Mr. Allen Lloyd, who died two years ago. Being the oldest couple that were ever engaged in the flower business in this state, much interest was felt in them by us all.

An inquiry by the president showed that about 10 to 12 members will attend the National Carnation Meeting in Chicago. There is some complaint that there is so little information out in regard to this important meeting.

Notes.

August Schmidt, for many years with Mr. John Rieman, committed suicide a few days ago. At times very much inclined toward dissipation, he is supposed to have committeed the deed out of remorse.

On Feb. 1 The Bertermann Floral Co. paid off all notes in full issued by the late firm of Bertermann Bros.

At Garfield Park two greenhouses, 10x100, have been added for bedding plants.

Robert McKeand and assistants are busily engaged getting ready for planting in all the parks the coming season.

W. B.

WANT ADVERTISEMENTS.

SITUATION WANTED—Gardener, single; in private place, understands care greenhouses, fruits, vegetables, lawns and everything in general; Best of references. Address W., Florists' Review, 56 Pierce Bldg., New York City.

PLANT SHIPMENTS TO MICHIGAN.

In reference to the Michigan law, printed on page 326 of your issue of Jan. 13, I mail you a letter from the "Inspector of nurseries and orchards" of the Michigan State Board of Agriculture, which indicates that greenhouse plants do not need inspection when they are labeled as such. The letter is as follows:

"Lansing, Mich., Jan. 28, 1898.

"Mr. E. Haentze, Fond du Lac, Wis.—Dear Sir: As you have no inspector in your state, a statement from Prof. E. S. Goff, of the Experiment Station, would be accepted. The express and railroad companies do not have to hold stock, but only to notify us of the shipment when not properly labeled. If you label your greenhouse plants as such, they would not need the inspection. Such has been our ruling regarding the law."

PLANT INTRODUCTIONS OF 1898.

The undersigned respectfully solicits from all those introducing or having a knowledge of the introduction of new plants to the American trade for the year 1898, such descriptions and information as will be of assistance in making up the complete list for the year which will be published as a part of the record of The Society of American Florists and Ornamental Horticulturists as was done last year but in a more comprehensive form. Address, Wm. J. Stewart, Secretary, 67 Bromfield St., Boston, Mass.

FREE JACKKNIVES.

An Iowa congressman received the following pointed communication regarding government seeds. "Why not let up on seeds for a while and send jackknives? Everybody could use them, and there would not be so much waste. In that case radish seed would not come up poor turnips, and the congressman would be saved much ridicule, which he now often gets."

Please mention the Florists' Review when writing advertisers.

SPRINGFIELD, MASS.

Encouraged by the bright outlook—violets selling for $3 per 100, for instance—Aitkin & Son have purchased the Herrick property and will at once commence tearing down and rebuilding the same. The land consists of two acres, situated at a convenient distance from the center of the city, where the store is located. Upon the best site Mark Aitkin will erect his dwelling house, with barn, etc. Running back will be the range of 14,000 square feet of glass devoted chiefly to carnations and violets, with a house for palms. This will be, when completed this spring, one of the snuggest little ranches in New England.

W. F. Gale reports quite a sale at Christmas and New Year's. Business has calmed down somewhat, but is very satisfactory.

Charles Miller has taken to wearing glasses, although he says they are not needed to see those grand roses that A. N. Pierson is shipping him.

W. M.

LENOX, MASS.

On January 28th the Lenox Horticultural Society held its annual ball and thanks to the committee of arrangements was a very successful affair. The assembly rooms were very tastefully decorated with laurel wreathing and hemlock, with a wealth of bunting, including a valuable collection of silk flags of all nations; it being a very cosmopolitan affair this was very appropriate.

The following well known Lenox "craftsmen" were on the committees: Arrangement, J. F. Huss, E. J. Norman; reception, Geo. Thompson, Alex McConnachie, A. H. Wingate, James R. Paul, E. Jenkins, A. J. Loveless. The following visitors were present: Messrs. A. T. Boddington, W. A. Manda and W. Marshall, representing J. M. Thorburn & Co.

New Forcing Rose.

Mrs. Robt. Garrett, Hybrid Tea.

Rich, soft pink buds, very long, flower extra large, delightfully fragrant, rivaling Bridesmaid in color, but larger and much more productive. A sturdy vigorous grower. A money maker and a triumph of American skill. The best firms in the country are investing in it. It has won numerous prizes and elicited the most favorable comment from critical judges.

Price, strong plants, from 2½ inch pots, $25.00 per 100. In lots less than 1000 $225.00 per 1000.

Orders booked now, delivery March 15th, 1898. Correspondence solicited.

CHAS. L. MARSHALL,

67 Merrimac St., - - Lowell, Mass.

BROOKLINE, MASS.

"I never did so much business on paper as during the past year," remarked James Quinn. All gilt-edged, but there's the rub, and it rubs some of the craft pretty hard, too. Mr. Quinn did a big thing in putting in an extra house of the Boston fern. There has been a large if not a larger demand for it than in previous years.

Miss Vass had a fine lot of poinsettias. Some by actual measurement from tip to tip were 17 inches across. T. O'Connor, of Providence, had the largest number I have seen in the east, but these were the finest.

F. E. Palmer was an unwilling prosecutor of his former clerk, who has just been committed to serve a sentence of five years for forging Mr. Palmer's name to a check. Mr. Palmer had previously overlooked several less serious acts upon his promise to reform. This happened at an unfortunate time, when business was exceptionally heavy, holiday trade with him being the largest on record.

M. B. Bunker disposed of 10,000 violets alone, by actual count, at his stands at the Parker House and the new palatial Hotel Touraine. While it could not be called a violet Christmas, Beauties, those which Philadelphia can grow, went fast, with carnations in their wake.

Azaleas grown by W. W. Edgar sold like hot cakes. He and Mr. Becker made a good double team, with Edgar slightly ahead in size and number, quality about the same. Mr. Edgar has a grand batch of longiflorums for Easter—two houses full. Among them are about 100 pots with seven and eight strong plants in a pot. How did you do it? Of course there were some diseased, but they are "out of sight." Ferns are being studied here. I noted particularly a bed of Adiantum cuneatum, cut over for holiday trade, throwing up another crop of higher fronds. Hydrangeas, acacias, rhododendrons are, with azaleas, looking fine, with promise of being just right at Easter.

Lilacs will not be overlooked. Fred Palmer will force quite a number for his store. Even if they do not sell as plants the flower is useful and highly fragrant, especially the kind Mme. Legraye, pure white; can be forced early, with plenty of foliage.

W. M.

WILKESBARRE, PA.

Ira G. Marvin has what might be termed a crystal store, having the whole panelled with plate glass mirrors. The effect is very striking and one seldom sees one's self so many times at once as in such a place. It is a Mecca for the gentler sex. Fine stocks are always kept on hand, supplied by additions made recently to the greenhouse plant.

W. M. Eldridge & Co. intend adding two houses to their plant. Business is reported by Mr. Humphrey as being very good.

HUNT'S REVIEW OF THE CHICAGO MARKET.

Market has changed but little during the past week. Stock still continues scarce. Almost any price at times could be obtained for first-class Maids and Brides, nor does relief seem immediate. There is no doubt but that there is an immense crop of buds in sight, but the weather does not favor their development.

Old timers state that the last few weeks have made history and all agree that not for six years past has there been so long a continued period of shortage and a uniformity of price at as high a notch.

Bulb stuff has come to the rescue nobly and the combinations tulips have gone through with continues in short supply, though the little to have been a revelation to many. Adiantum still be had while short in stem is good in quality. Violets show a stiffening in price, that is, while quotations remain about the same. The bulk of receipts are cleared out at list prices.

It is a matter of importance to know that fern dealers east report stock of fancy common ferns to be lower at present than for several years past at this season. Those having contracts at reasonable rates probably have good reason to congratulate themselves.

DRACAENA GODSEFFIANA.

This new dracaena is now being offered by Sander. The foliage is described as a deep, polished green, heavily spotted and splashed with creamy white. The engraving, which is from a photograph, shows a very handsome plant, and it is said to be as tough as an aspidistra.

TROY, N. Y.—Mr. Jas. A. Fraser, formerly traveler for the Lovett Co., Little Silver, N. J., is now with the firm of Young & Halstead, seedsmen, this city. Young & Halstead are the successors of the Morrison & Westfall Co.

SELAGINELLA EMILIANA.

5,000 plants of the above for sale in good condition. 2½-in. pots at $4.00 per 100; 3½-in. pots at $8.00 per 100; 5-in. pots at $15.00 per 100.

LONDON, ONT.

An Exciting Election.

The London Horticultural Society held its 31st annual meeting on Jan. 19. It was no love feast, as the operations of this society are in name only, it being used as a stepping stone to the Western Fair Association, and being practically the nucleus for that association. Considerable enthusiasm was manifested in the election of officers, particularly when politics were introduced. Everything went smoothly until it came to the election of first vice-president. Each party had come prepared to elect their man, neither party objecting to the mode of procedure until the scrutineers rendered their decision, then a first-class row started. The chairman was unequal to the occasion, and at one time it looked as if a free fight would take place. During the confusion the balance of officers and board of directors were re-elected. They immediately adjourned and the defeated party then held a meeting and elected a set of officers and board of directors to suit their political slate. Writs have been issued to set aside the election and in all probability a costly law suit will be the outcome.

Messr. Gammage & Sons Entertain.

Messrs. Gammage & Sons entertained their employes to a supper on the 3rd inst., some twenty sitting down to a well laden table. After doing justice to the good things provided short speeches were in order, when Mr. H. Taylor, in a few brief words, presented Mr. and Mrs. Wm. Gammage with a beautiful marble clock as a token of the esteem in which they are held by the employes.

The weather, well, the weather man has been around here, too; 12 degrees below is the coldest recorded, but that with a strong wind is cold enough to suit most florists.

Trade still continues good, using up everything as fast as it is offered.

Mr. F. Dicks will shortly retire from the management of the London Floral Co. W. G.

SIMMONS'

New Light Colored CARNATION

Mrs. S. A. Northway

We introduce this variety with even more confidence than we did Portia, Silver Spray, Tidal Wave, Daybreak, Rose Queen, or J. J. Harrison, knowing that it will become as great a cut flower variety as any of the above. Plant of strong, free growing habit, entirely free from disease or rust; large round high built flower with perfect calyx and extra strong and long stem. Color a beautiful soft shell pink becoming almost white when fully open.

Orders booked now and filled in rotation. We shall commence to ship soon after Jan'y 1st. Price, $10.00 per 100; $75.00 per 1000.

Geraniums. Md. Bruant, Md. Jaulen, Fleure Poitevine, J. Ricaud, and J. Sallier, 2¼-in. pot plants, $5.00 per 100. Rooted cuttings, $3.00 per 100; $25.00 per 1000. Our superb stock of all the finest sorts, 2¼-in. pot plants, named, $25.00; unnamed, $20.00 per 1000. Rooted cuttings, $12.50 per 1000.

Fuchsias. A grand lot of summered-over stock in small pots that will make early bloomers, $3.00 per 100.

All Rooted Cuttings Cash with Order.
Our Price List describes many other fine plants. Send for it.

Two Great Sports.

Carnation Victor.

Undoubtedly the best Pink Carnation in commerce and certainly the most prolific bloomer, perfectly healthy and of vigorous growth.

Rooted cuttings now ready, $4.00 per 100; $35.00 per 1000. Come and see this Carnation growing.

Chrysanthemum Pennsylvania.

The finest yellow for cut blooms or exhibition purposes ever produced. Plants ready March 15, $5.00 per doz.; $35.00 per 100; $250.00 per 1000.

HUGH GRAHAM
104 South 13th Street, Philadelphia.

FIREFLY!

A Rust-Proof Carnation for Business.

Bright scarlet and Positively RUST PROOF and as productive as Scott. Rooted cuttings, Feb. 15th, $10 per 100, $75 per 1000. Send for descriptive list of Firefly and fifteen other novelties of 1898, as well as fifteen varieties of '97; also older standard varieties.

Geo. Hancock & Son, Grand Haven, Mich.

SMILAX FINE STRINGS 12 1-2 CENTS

A. J. BALDWIN, Newark, Ohio.

The key to success is proper ventilation and watering. The key to proper ventilation is the Evans' Challenge Ventilating Apparatus. Works easily, does the work right, built to last, always satisfactory. No toy imitation but a machine to do its work and do it well. Much the cheapest in the end. Quaker City Machine Co., Richmond, Ind.

Carnations

Rooted cuttings of both standard varieties and novelties at popular prices.

Ready January, 1898.

F. Dorner & Sons Co.
LAFAYETTE, IND.

New Pink Carnation Mrs. Frances Joost

Seedling from McGowan x Wm. Scott; tested for four years. It is of an exceedingly pleasing color and proved itself an early and most prolific bloomer. It makes in a short time a fine bushy plant, and has the form and habit of what carnation men say make an ideal plant. Positively free from rust. The stem is strong and heavy enough to carry the large flower erect without tying of any sort. Calyx perfect; never bursts. It is a good keeper and a good shipper. You will make no mistake by trying a few. All orders filled in rotation. As the sale of the stock of this Carnation will be limited, it is advisable to order early if you want any. Satisfaction guaranteed.

Price, $2 per doz.; $10 per 100; $75 per 1000.
Cash with Order.

C. BESOLD, ...MINEOLA, LONG ISLAND, N. Y.

KATHLEEN PANTLIND DAYBREAK x SCOTT

Is a much more substantial flower than Daybreak; color a shade or two darker, and entirely rust proof. Can be seen at Vaughan, McKellar & Winterson's, Chicago, every Wednesday and Saturday.
PRICE—$1.50 per 12, $10 per 100, $75 per 1000.
PREMIUM—5 Red Wave with every 100 Kathleen Pantlind.

Z. K. JEWETT & CO.,
SPARTA, - - WISCONSIN.

COUNCIL BLUFFS, IA.

During a recent visit to Council Bluffs I was much attracted by the beautiful stores of J. F. Wilcox and McPherson & Reed, which are located on the most prominent street of the city. After visiting the stores, which are a pride to the owners as well as to the city, we took a stroll to the greenhouses. Both establishments are close together and well situated for greenhouse purposes. Stopping at Mr. Wilcox's houses first, I must say his place is a model florist establishment. His range of new houses are all filled with the leading varieties of roses and carnations, and are in as good a condition as I have ever seen, especially his American Beauties, which are a pride to the owner as well as to his help.

I next visited the houses of McPherson & Reed, where I found their elegant place in perfect condition. Their stock shows up in excellent shape, their Meteors being especially fine. Also an elegant bunch of Lilium Harrisii and callas. Both parties were very much pleased with their holiday trade, and look for a big increase in business this season on account of the Trans-Mississippi Fair. J. J. H.

KANSAS CITY, MO.

Trade in cut flowers the past two weeks has been very good, especially so in funeral work, all having lots to do. The man with glasses seems to have lost his hold. Stock is very scarce, especially American Beauty.

Plant trade is exceedingly good, azaleas, cyclamens and freesia going very nicely with now and then a palm and an araucaria.

The new license ordinance, taxing greenhouses $25 a year, is going to be defeated if possible. A few of the craft here are well up in politics and those headed by E. F. Brown (who may run for alderman himself in the spring election) are getting an ordinance into the council to save us each $25, and we all live in hopes.

Geo. M. Kellogg, of Pleasant Hill, in town for the first time in six weeks, reports demand far in excess of supply. S.

M. A. HUNT FLORAL CO., Terre Haute, Ind.

ELMIRA, N. Y.

At time of my previous visit, and when making notes of an interview with Grove P. Rawson, I made a sad blunder in mentioning violets and can only attribute the error to my dull ear, which misconstructed the word "Lulu" into Waterloo. Remembering that the great Napoleon met his defeat upon that historic battlefield, I associated the Napoleon of violet growers with the immortal French emperor. I have confessed and am forgiven and am happy in the consciousness that I did not shift the blame upon the shoulders of some unseen individual in the composing-room, but faced it like a man.

Being pressed for time on this trip I was unable to visit the houses, but, piloted by the able manager of the store, Mr. Durand, dropped into the cellar adjoining the store, and which has recently been renovated. This is really an immense natural refrigerator and a splendid place to keep the cut flowers as sent from the houses for own use and for shipping purposes. I saw part of one day's cut and noted Brides of pearly whiteness, Bridesmaids of a lovely blush, Perles of a deep golden shade, Gontiers a fiery red, grand stock all, and understand such has been produced right along. Meteor used to be grown, but has been dropped for some time. Mr. Rawson intends trying it next season, having now a suitable spot for it.

Violets are very rich. I noted at Hoffman Bros. as pretty a lot as one could wish to see; healthy, profuse, fragrant and of an intense blue. Roses now off crop, but have been all that could be desired, and will be all right for Easter. W. M.

AN UNPARALLELED SUBSCRIPTION OFFER.

EVERY one to whom this issue of the FLORISTS' REVIEW is addressed, and who fills out, signs and returns the accompanying subscription blank, accompanied by $1.00, within 30 days from date, will receive not only the FLORISTS' REVIEW for one year but also a certificate entitling him to the earnings on one-tenth of a share of stock in the company formed to publish the paper. The shares will be of a par value of $10.00 each.

Why do we make such an unparalleled offer? It is very simple.

You will have an interest in the success of the paper.

You will see that you can buy everything that you want to just as good advantage from advertisers in the FLORISTS' REVIEW as elsewhere and at the same time benefit yourself by increasing the earning power of your certificate.

This mutual arrangement cannot fail to bring to the paper a heavy advertising patronage, and as a result the stock represented by your certificate will earn good dividends.

And the more you buy of advertisers in the FLORISTS' REVIEW (always mentioning the paper) the larger your dividends will be.

You will get a better paper than has yet been published in this field, and a share of its earnings. Please let us hear from you by early mail.

FLORISTS' PUBLISHING COMPANY,

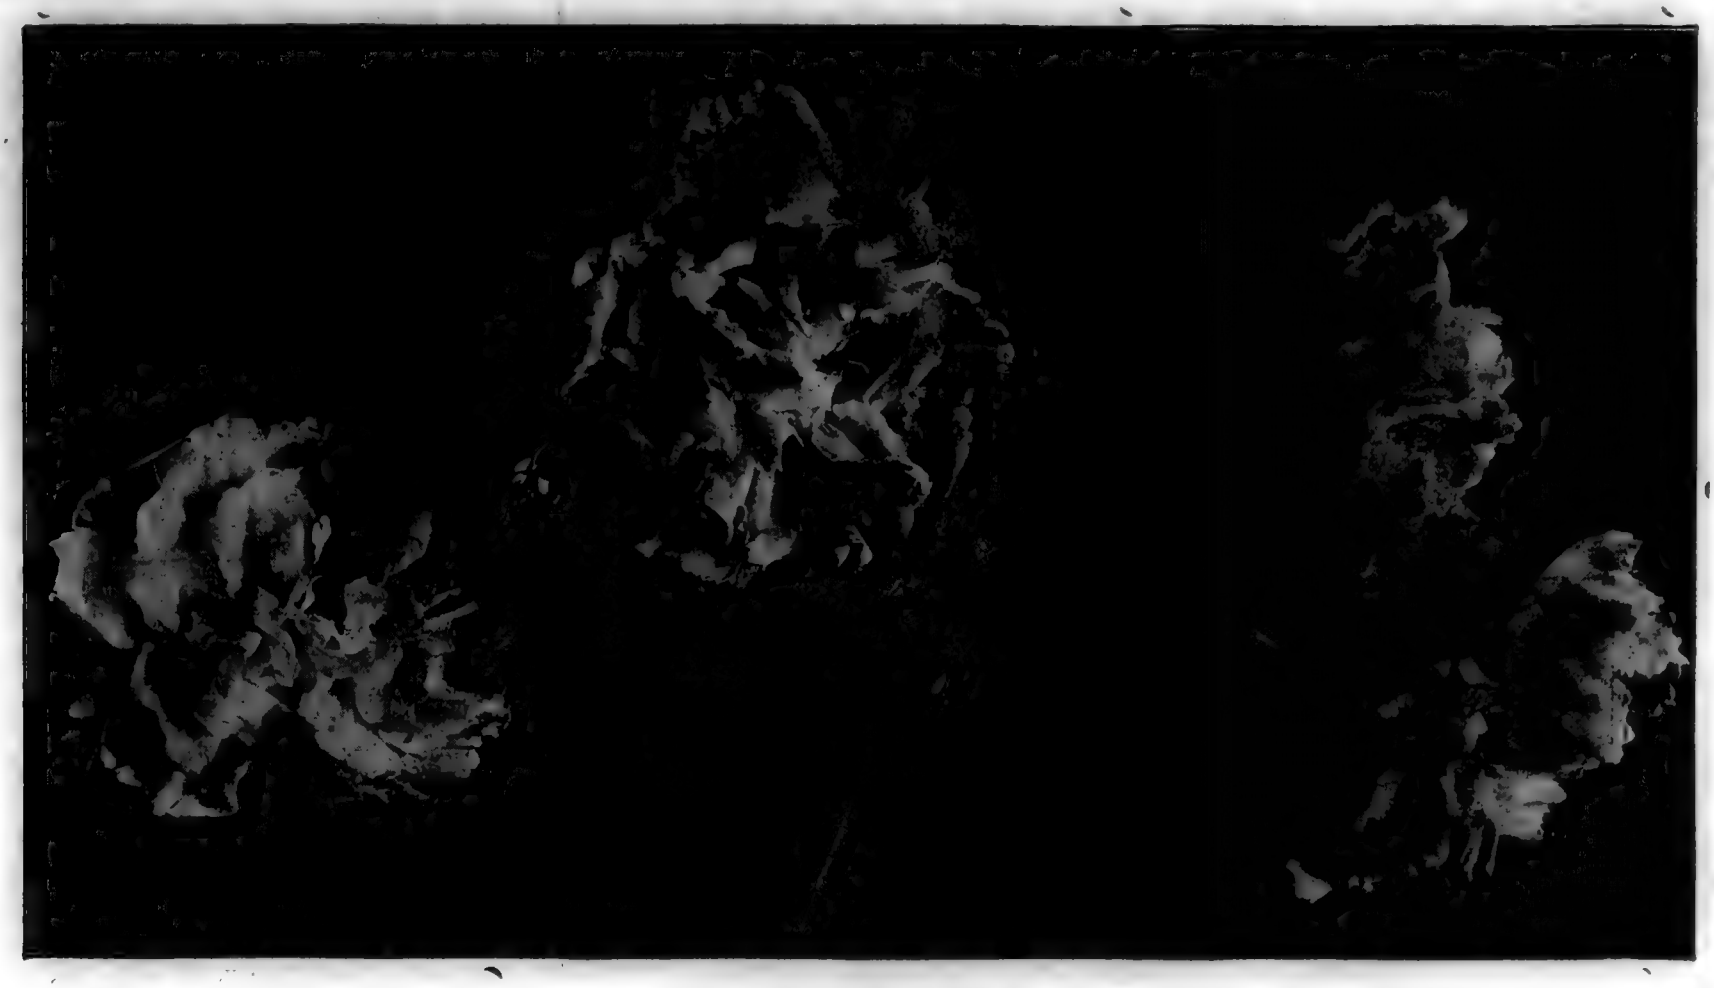
CARNATIONS

AMERICAN CARNATIONS.

Just at this time when the air is full of carnation talk and convention topics the eye intuitively surveys the whole carnation field, takes retrospective glances down "the vista of the years that have passed" and incidentally reviews the past once more in the light of present day wisdom to measure the extent of progress. And what a forward march of progress it has been. Within a comparatively limited number of years we have seen evolved a race of carnations peculiarly and truly American, a race showing marked distinctive features when brought into comparison with other types prominent in the great carnation family in those countries where for centuries it has been a cherished flower. I said for centuries because there are records to show that the carnation was cultivated in England during the reign of Edward III. (1327-1357), and you may see beautiful carnations portrayed in some of the flower pictures of the early Dutch painters. But European carnations are for the most part summer varieties, and although they have a winter flowering race called "tree" or "perpetual blooming carnations," it is not of such relative importance in sustaining the love for and popularity of the flower. Here the conditions are exactly opposite. It is as a winter flower that the carnation has won the affections and the lasting regard of thousands.

All along the carnation has shown an amenability to development along divergent lines, hence the many types or forms in cultivation in the old world, hence also the possibility that after 500 years we should see originated here a race that has no exact counterpart elsewhere and meets our necessities to the fullest degree by adapting itself to different conditions climatic and otherwise. Burns, in one of his poems, asks that some power might be given us to "see ourselves as others see us." Just now, then, in this season of mutual admiration of the race of American carnations it might be advisable to find out how others see them.



Referring to a paper I read at Madison on carnations, and which was printed in the London Garden last August, a large carnation grower remarked in a subsequent issue: "The article is interesting from an American point of view, but it is not very practical for this country, as the type of flower that is admired in America is totally different from that which we consider beautiful here. Take any of the best American carnations, they have all papery petals with the roughest possible edges; they are most of them, it is true, nicely scented. If an amateur wishes to please his own fancy only, he may, of course, indulge in American or raw-edged varieties to his heart's content, but should be wish to be successful in the exhibition tent it is imperative that he discard anything of this sort. He must see that his flowers are perfect in form; that the petals lie flat all round with perfectly smooth edges; that the calyx is unsplit; that the colors are bright and that the stems are strong and able to support the blooms, etc. * * * * * * Amateurs may, however, take this as a golden rule that it is of no earthly use their placing any American or rough edged flowers in their show stands in any high class competition, for the judges simply ignore them."

In other words to the above—No Americans need apply for recognition at the court where the carnation sits enthroned across the water. But will this vision of our carnations as others see them bring gloom and sorrow to those who have labored so well over here? I think not. The only regrets will be of a sympathetic kind that our friends across the water cannot see farther. The above quoted remarks were not allowed to pass unchallenged in the pages where they appeared. We see the essential requisites of a carnation detailed and how do ours compare with them? Flowers should be perfect in form, stem self-supporting, colors bright, calyx unsplit (although one-half the English carnations are tolerated with split calyces), but herein alone we differ; the petals must be smooth edged and flat before the varieties can hope for recognition from the powers that be or that claim to set the national standard of form. The serrate-edge is the bugbear of carnation societies in England and I know only too well that the judges ignore them, having been a victim on more than one occasion, and been passed for exhibits distinctly inferior but "correct" in form.

The absurdity of all this is the more apparent when you look into the history of carnations. In the pictures before mentioned you see fringed flowers

New White Carnation Evelina.

Carnation Flora Hill.

Photographed by J. Horace McFarland, Harrisburg, Pa.

alone and if you go right back to the wild single carnation, as it grows even today on ruined castles in Normandy, you will find that its petals have the same characteristic serration. Latter day developments have made it possible to have two such distinct types of flower, and the trend of progress in American carnations is in the same direction; witness some of the newer varieties, Alba superba, Glacier, Mrs. James Dean, etc., but I hope the day is very far distant when the American Carnation Society will take a ridiculous and indefensible stand, and declare one type of flower correct, the other incorrect, and publish a standard of type so closely drawn as to destroy individuality of variety, creating instead a form for all, with about as many lines of beauty as there are in those floral enormities a little skill can carve out of a cabbage stalk.

The previous remarks notwithstanding, I will assert that if American carnations would only do as well in England as they do here, they would be welcomed by thousands who have gardens and grow their own flowers, and they would find a ready sale in the markets. Lack of sun in winter will, however, always operate to their disadvantage during that season and render impossible results that will bear any comparison with what is achieved here, since as before said climatic conditions were a potent aid in developing the race of American varieties.

With a record to date of continuous advancement, in what direction shall we look for further future progress? Were there ever more candidates for election to position on the scroll of fame than this present season and how many of them will be growing a decade hence? Yet there is room and scope for further achievements and a possibility that this year or next or the following may be written in scarlet or gold with special significance, conspicuously prominent upon the roll of records. A commercial red or yellow comparable with the best in other colors that we have today would surely make a banner year of the year that saw its birth. We shall not be striving after the impossible, and it seems strange that up to date a good all round red has not appeared, because, at any rate, among European carnations red is quite a predominating hue. That a pure yellow is lacking need not occasion so much surprise for it is past history and present day experience that constitutional delicacy has some mysterious affinity or connection with the possession of this color. There are now, however, on the other side a few really good yellows and though not belonging to the winter flowering class they ought to be of service, and possibly in the course of several generations, enable us to fill the vacant niche. They are on this side now in the hands of one or two of the most reputed raisers. Casting up the total of gains that belong to the past the volume of them is encouraging, inspiring to greater endeavors in a future full of bright prospects.

A. HERRINGTON.

Madison, N. J.

CARNATION NOTES.

New Varieties of 1897.

Mrs. George M. Bradt.—I said in my last notes that perfection has not been attained yet; there is yet a wide field for improvement. The improvement accomplished in some points tends to emphasize the deficiency in others, shows more plainly the often inharmonious construction of a variety, and led onward by our sense of the beautiful, we feel the necessity to bring about harmony. So this variety, too, lacks in some very essential points. But of all the varieties grown and sent out by us, none has given me more satisfaction than this variety has. It is a type of its own, possessing properties not equaled by others.

This variety is the result of a cross between a dark pink seedling noted, No. 17 (92), in my books, and Mme. Diaz Albertini. The parents of No. 17 (92) were Mrs. Reynolds and a scarlet seedling, No. 36 (90). So I may say the parents known are Mrs. Reynolds and Mme. Albertini. The light and dark pink changed to white, the color of one of the parents of Mrs. Reynolds, and the scarlet of the scarlet seedling mentioned above cropped out in the scarlet stripes.

Striped varieties have always been looked upon as unprofitable to grow, except in limited numbers to supply the demand for such blooms. This variety seems to be an exception, for the happy combination of its color, white and scarlet, has captured the flower

loving public. It has charmed me in the same way, for had it not been for the color I would have discarded it the first season of its blooming, as my description of this variety will show.

The first bloom that appeared on the seed plant showed up fine, but possessed a weak stem and had a slight inclination to burst the calyx. All the rest that followed went hopelessly to pieces, but that cheerful color seemed to influence me to give it a second year's trial. The second year showed a very marked improvement, the rather compact habit changed to a little more spreading, the flower stems appeared stronger, and about half of the blooms did not burst. These non bursting blooms were of somewhat larger size than the others; that is, the petals grew longer and lost some of the crowded and twisted appearance. This improvement in the setting of the petals seemed to save the blooms from bursting.

Mrs. Geo. M. Bradt.

The bursting blooms still produced did not deter me any longer from giving it further trial, and my expectations were surprisingly fulfilled. The bursting blooms disappeared almost altogether, the stems gained in strength, the blooms showed a marked improvement in size and form, by expanding the petals more freely, and, best of all, it assumed a freer disposition to bloom.

Now let us look at the plant as it appears to-day. The young plants in the field assume a rather upright growth, but the weight of the strong, heavy branches will soon spread them. And now appears a fault in the habit that is rather provoking. Strong branches, pulled over by their weight, break off completely when switched by the wind or handled carelessly in topping or lifting. This appears when stem and branches become woody. It seems the branches increase in thickness without increasing in adhesion to the stem. Careless handling and storms often cause severe loss, but when once safely housed all danger of breaking is over, and, strange to say, with the softer inside growth the branches seem to adhere better.

The foliage is strong, hard and heavy, and of that dark bluish color indicating health and resistance to disease. Exposed to rust, where other varieties susceptible to this parasite would soon be affected, this variety remained free. Now, I will not maintain that it is rust proof, for I have said before that I consider such an assertion absurd, but so long as it receives a culture conducive to health, it has ten chances to one of remaining free from this disease. It seems comparatively free from other diseases, save in isolated cases, which is the case with almost every variety.

I have said once before that this variety is entirely free from cropping. I repeat it again, and in this respect it possesses a property not equaled by any other variety, to my knowledge. It commences to bloom early, and when once fully established on the bench, there is not a portion of the plant that can be called unproductive. The young shoots, not over numerous, mature quickly and produce a bloom; there are no idle shoots lingering on the plant; all is business. Therefore the plants are never seen full in the body, like other varieties, and for this same reason cuttings appear scarce, and never in large numbers at one time. This variety blooms now for the fifth year, and for the last three years it has proven the same even bloomer, producing flowers of the same quality from early to late, slightly increasing in productiveness as the plant gains in size. Inferior blooms are very scarce on our benches, which was likewise the case in former seasons. We kept careful count of our cuttings last year from the 1st of November to the 1st of May, and it shows nearly an even number for every week, slightly increasing up to April, when it dropped off on account of the cuttings taken from the plants for propagating purposes. Its character is set, and I believe there is no danger of deterioration, unless when mistreated or neglected.

From the above one might infer that I wish to say that this variety is one of the freest bloomers in cultivation. True, it is very free in its way, but numerically, to make a comparison, Scott will furnish about double the number of flowers to a plant. These large blooms take longer time to develop, and the smaller number of larger flowers per plant is equal to any other variety in weight.

There is one unfavorable point to mention, and this is, the disproportion between stem and the matured bloom. Strong and heavy as the stem appears, carrying the nearly open blooms erect, when fully grown these very large and full blooms become too heavy, and often the stem has to bend under its full weight. But the improvement in this line has in the past years been so marked that more can be expected in the future. The calyx is an inheritance from its parent Albertini. Fragrance is slight, often hardly perceptible. The general form and setting of the bloom is original and not found in any of its ancestors; if there is any fault to mention, it is the fullness of the blooms; anthers and pollen are rather few; pistil is of a peculiar form, branching often like an elk's horns.

There is yet a rather agreeable feature to mention, and that is its inclination to sport to a solid scarlet, the color of the stripes. These scarlet blooms of the same form and finish appear often here and there, and are of considerable interest. I will try to obtain a few of the scarlet variety this season, if that color can be set and made permanent. The free appearance of these sports gives me the impression that it may as easily revert to the original and not prove constant, but it is always worthy a trial, as these scarlet blooms have so far attracted a great deal of interest. Everybody who grows this variety has the chance to make the trial, as they are as likely to appear in a dozen plants as in a hundred.

Not without faults, this variety is

growing in favor all over the country, and as there have no unfavorable reports come to my knowledge, I flatter myself with the hope that it will be grown as universally as Wm. Scott.

FRED DORNER.

A CARNATION INTERVIEW.

Our interviewer recently called on Mr. C. W. Ward, Queens, N. Y., armed with a complete supply of interrogation points. The following is a record of the points and the answers kindly given in response:

"Do fancy carnations pay?" "Yes, like everything else, if done properly, and you have a large city trade that has been educated to paying fair prices for the newer and fancy varieties. They have paid better this season for the reason that the retailers have caught on to the fact that a 3-inch carnation that will keep four or five days, and which costs rather more to produce that a good rose, is worth as much as the rose, and prices which the grower receives have correspondingly improved. But in smaller towns, and for people of moderate means, the standard varieties that bloom profusely must be the standbys. These conditions will, however, gradually change as large flowered varieties that bloom more freely are disseminated and as the leading florists in the smaller towns educate their customers to prefer the larger and better blooms."

"If a fair question, what is the average price you receive for your carnations?" "A little better than $4 per 100."

"Do carnations pay at $1 per 100?" "Not from my standpoint. I should expect at least an average of $2 per 100 for growing such sorts as Scott, Alaska and McGowan, if disbudded."

"Does it pay to disbud carnations, say the ordinary varieties?" "It does not pay to do anything else."

"Does it pay to grade your flowers?" "Yes and no. By that I mean that all grading should be done on the plant. When you disbud, cut out all weak growths, and all your flowers will then be good enough to put into one grade, and if you grow the right varieties properly that grade may well be called fancy."

"What is the highest price you receive for blooms during the season?" "$8 to $10 per 100." "And the lowest?" "Generally $2, in early fall, when stems are short on first crop."

"Does soil in different sections have any effect on varieties?" "Decidedly."

"What do you consider the best soil?" "A good, stiff, sandy loam, for average varieties. There are two varieties of poor soils, a very stiff clay and a very light, sandy one."

"How can you improve these poor soils?" "In the stiff clay soil you can add sand or rotted sod or light, strawy manure, and the sandy soils can be improved by adding clay and heavier soils. For outside it requires a coat of five inches thick of clay over a light soil, and ploughed in."

"Do you believe in fertilizers?" "Yes, decidedly, if used with care and judiciously."

"What do you recommend?" "Horse, cow or sheep manure, rotted sod, bone dust, ammonia, charcoal, common salt as a top dressing, and Canada ashes (the two last named should not be used in the greenhouses), potash, nitrate of soda, night soil, guano—all these latter to be diluted with water."

"Kindly give me some of the formulas for using the above different fertilizing agents." "We have no formulas. We watch the plants, and when

White Cloud.

New York.

they seem to be in need of something to eat, we give them a top dressing of sheep manure, sometimes horse manure, sometimes a little bone dust. Again, if above are lacking, we use manure water, and that can be made from almost any manure, provided you don't get it too strong. Carnations are great tea drinkers, but they don't like whisky or brandy. It is strictly a temperance plant."

"Do you advise planting in the house direct, or from the open ground?" "Yes and no. It depends on the variety and location. Buttercup, Jubilee, Eldorado and those varieties that are injured or checked by lifting should be planted in the house about the first of June, but Scott, McGowan, White Cloud, Flora Hill, Mrs. Bradt, New York, John Young, Mrs. James Dean, Maceo, are all grown in open ground with us, and lift in fine shape."

"Is it necessary to have a ball of soil when lifting your plants?" "Not in our soil."

"What distance apart do you usually plant your carnations in the house from the open ground?" "Twelve by ten inches."

"What distance when planted in the house direct—that is, from small pots?" "Same distance."

"What supports do you use, if any?" "Wire netting, with the Dorner system of wire and string overhead."

"What temperature is best for carnations?" "This may be divided into three sections, according to variety. For example, Daybreak, White Cloud, Lily Dean, Mrs. G. M. Bradt, do well in an average temperature of 48 to 50 degrees, and you get stiff stems. William Scott, New York, Flora Hill, Mrs. James Dean, Maceo, John Young and varieties of that type, 50 to 52 degrees. Buttercup, Bon Ton, Eldorado, Maud Dean, Mme. Diaz Albertini, Storm Queen, and varieties of this type, 52 to 56 degrees. Yellows, even higher, with an average rise for sun heat during the day of 10 to 15 degrees applied to all."

"What house do you recommend for carnations?" "An even span running east and west, about 22 feet wide, so as to allow three 4-foot benches with paths round each bench not less than 2 feet; the path should also be between the side of the house and the bench."

"What is the ideal carnation you are striving for?" "A perfect flower, four inches across, perfect calyx and color, stiff, erect stem three feet long, and to produce forty flowers to the plant during the season, thirty to be produced during the winter and to sell at $2 per dozen wholesale."

"What are your ideas about ventilation?" "Give all the ventilation you can, without checking the plants."

"What varieties will you grow next year?" "Pink: New York, Mrs. James Dean, Mrs. Frances Joost, Argyle. White: John Young, White Cloud, Flora Hill. Yellow: Gold Nugget and an unnamed seedling of my own. Scarlet: Bon Ton and two unnamed seedlings of my own. Crimson: General Maceo and two unnamed seedlings of my own. Variegated: Mrs. G. M. Bradt and a variegated William Scott. I shall grow Mr. Dorner's seedlings and many other varieties advertised, for trial."

"What is the cause of carnations going to sleep?" "Hard to enumerate all the causes. Lack of proper food, growing them too warm, overfeeding, overwatering and underwatering, are all causes of carnations not keeping."

THE CARNATION FROM THE COMMISSION MAN'S STAND-POINT.

By Mr. Flint Kennicott.

(Read before the Chicago Convention of the American Carnation Society.

Mr. President, Ladies and Gentlemen of The Carnation Society:—Through Mr. Rudd, Mr. Herr has requested me to make a few remarks from the Commission Man's standpoint upon that most beautiful and useful flower, of the genus dianthus, but to the trade more commonly know as Carnation Pink, and in all commission houses simplified to C. P. I am not in the habit of writing papers and these few remarks will be but a rubaboo or mixture of ideas. Of course, you are all carnation growers, but my few remarks will be made from the standpoint of a commission broker of cut flowers.

In my opinion, if you are growing for the trade, you should confine yourself to carnations only, with as few side issues as possible, and of C. P. not too many varieties, say 5 or 6 and not over 8 varieties at the most, and grow only such as you can do well. Discard all others, unless grown for experiment or pleasure. Your merchant wants a number one, "bang up" stock, with large, perfect flowers and long, stiff stems, with good foliage. Such he can sell to best advantage. In my opinion, straight colors, clear and pure, are best to grow—white, pink in shades, red in shades, and yellow. There are many good whites, and white C. P. are always staple, more so than any other color; so give a good share of space to the white or whites that you can grow best. A good white or two you must have. They should be pure white and good large flowers on long, stiff stems. The day of short stemmed carnations is past. The customer wants them long. For design work, he picks them off himself. It is very seldom now that short C. P. are asked for and then it is only by some back number who is still in the woods. After white, the best in demand are the different shades of pink—dark, medium and light— represented by Tidal Wave, Scott and Daybreak; with intermediate shades, but, to sell well, they must be distinct in color. No mongrels need apply. In red, the very dark magenta shades, such as Old Sport (not the "old sport" who sells chewing gum and is a well-known character in Chicago streets, but the old, blackish C. P.), Prince of Morocco and others of the same ilk are

not in demand, excepting for entertainments of certain college societies and as colors of football and baseball teams, but of a good red C. P. we are much in need; one the same shade as Portia, with just as long a stem but stiffer, and of the same keeping quality, with twice the size of bloom, and one that is as free a bloomer. Of course, there are Jubilee, Meteor, Morello and many other fine reds, but they are so scarce you cannot get them when you want them or sell them at listed prices when you have them, as they must be classed as fancy, with a fancy price, or the grower will be left. Now, what is wanted is a good, large, dark red, something better than Portia, that can be sold as first-class with good whites and pinks, etc.

Yellow is still a novelty. No merchant can quote it as he does white, pink and red and be sure he can get them. There is no doubt that if a free blooming yellow could be found and produced freely enough so your merchant could depend on it, it would find a ready sale at prices above all other colors, but I have never known the time when I could promise 1,000 yellow carnations one day in advance, no, not fourteen days. Now, in white, pink and red, I will promise you 100,000 in

Mrs. James Dean.

fourteen days, if price is satisfactory. So, I class a yellow C. P. as a novelty until one of you gentlemen will grow one that will bloom as freely as the old DeGraw.

As to the variegated carnations, such as Helen Keller, Mrs. Bradt and many others, they are also novelties, and though to my taste, they are very beautiful, still, as your merchant, I will say that, commercially they are worthless, except as a novelty. They are seldom asked for and when they do find a market it is through a forced sale, due to chance. Excepting in a house devoted to your own pleasure, I would advise growing very few variegated C. Ps. Clear colors are what "knock!"

Now, gentlemen, your merchants are not idiots, although a few of them may appear a little "daffy." They do not expect you can grow every flower to perfection, but they do expect that you can separate the perfect from the imperfect blooms and bunch them separately and even make a third class, if necessary. Carnations should be tied 25 in a bunch. Four bunches will then make 100 and your merchant sells all his goods by the hundred and he trusts to his grower's count. In the Chicago market, the growers are all known by number and a customer soon learns the number of the grower who produces the stock he wants. He naturally buys stock from the lots in which he has found 25 perfect flowers to the bunch and will ask for that grower's number next time; so, for your own sake, as well as that of your merchants, be sure there are 25 perfect blooms in every bunch. No matter how scarce flowers are, do not count short. Put in one extra rather than one short. Many growers have yet to learn that six bad ones or even sixteen are not equal to one good one, so never put a "ringer" in your bunch, for the customer who buys 100 first-class carnations of your merchant expects to get 100 and will make no "kick" if there are 101 first-class ones, or he will say nothing if there is an extra two or three, but, if for the 100 he gets 92 that are perfect and 8 that are "ringers," gentlemen, "the fur will fly." An extra one or two should really be included in the bunch to allow for an occasional broken neck.

Put your second-class stock in separate bunches and your merchant will

take care of it, but never mix any of your seconds or rubber necks with your firsts, and, if you have any thirds, send them along, unless you are short on fertilizers. May be they would help out on commission and express, but never mix them with your first-class stock. One "ringer" will kill the entire bunch.

I want to say a few words regarding the naming of C. P. It is a bad mistake that some of you make in naming your C. P. after staple roses, such as Meteor, Bridesmaid, etc., and it causes your merchant much confusion. Thus, an order comes for "one Perle, one White Carnation, half Meteors, half Maids." Your merchant has to be a mind reader to know whether roses or C. P. are wanted. On last two mentioned, I have known more than one mistake to occur. And a carnation "by any other name would smell as sweet," wouldn't it?

Ladies and gentlemen, regarding the bunching of C. P., I am going to make a few illustrations. Here is a bunch of 26 good C. P., tied as they should be, even heads, with each individual flower showing; also showing every stem of equal length; that is as it should be. This one is not. It is tied all wrong. But, may be, the grower had a reason; let us cut it open. What! 28 carnations! O generous man! But, hold on; see, here are three dead "ringers" and two short stems. His generosity is misplaced. The ringers, alone, would kill the bunch, even had there been 25 good ones. But two are short, and do not count. The bunch has only 23 carnations in it. Register another "kick" for your tough merchant. No. 1 is the way to do it; No. 2 is the way not to do it.

Now a word as to pickled stock. The experience of years ought to teach every grower that pickled stock does not pay, but at every holiday the mistakes of the previous year are more or less repeated in this respect. It will invariably prove the most profitable to you as well as most satisfactory to your merchant and his customer to keep sending your flowers in as fast as they are in proper condition for market. Pickled stock always results in loss to the grower, trouble for your merchant and dissatisfaction to the buyer. I cannot emphasize this fact too strongly. The grower who pickles stock is invariably working directly against his own best interests.

Carnation Victor.

SECRETARY'S REPORT.

Mr. President and Gentlemen of The Carnation Society:—Your secretary reports having issued the reports of last meeting in due time and sending them to all members who were not in arrears for dues.

There are on the books Feb. 1st ninety-four paid-up members. The revenue derived from these will not pay the running expenses of the society and there is room for considerable missionary work by these ninety-four members.

Every year the mail matter of this society gets heavier. The past year there was not less than three hundred parties outside of the society who wrote your secretary on matters pertaining to the society, and it remains for the society to say whether or not they will be burdened with postage (which has not been charged up in the past, but which your secretary believes will reach $10 the coming year) or whether the secretary shall not recognize such letters from parties other than members.

Respectfully submitted,
ALBERT M. HERR, Sec'y.

CARNATION VICTOR.

"To the victor belongs the spoils," and to carnation Victor belongs the credit of being one of the finest pinks of its own peculiar shade in the market.

Mr. Hugh Graham discovered it about four years ago. It is a sport from Daybreak and has all the good points of this variety without any of its bad ones. This is not its initial appearance; "it has been tried and not found wanting." It has color that is at once pleasing and desirable, a beautiful soft pink that you find sometimes in hollyhocks, deepening to the center. The flower is large, with a fine long, erect stem. The plant is a free flowerer, but not a cropper, and is clean and free from rust. What more could be said about a carnation?

Mr. Graham has been unusually lucky with sports (though he is far from being one himself). His chrysanthemum Philadelphia and its yellow sport Pennsylvania, will and have sustained the reputation of this grower, of which he is very jealous, for he would rather "dump" a variety than disseminate an unworthy or useless one, an example that is indeed better than precept.

B.

VIOLET NOTES

It is now time for those who did not save fall-rooted runners for stock to think about next season's supply. For myself, I would not think of planting divided old crowns, as so many advocate. Perhaps it is all right for those who succeed, but personally I want none of them. Give me a thrifty, stocky young runner, rooted quickly and kept in a cool, healthy growth.

Care should be taken in cutting the runners, and your self personally, or your very best help, is none too good to do this work, as there are always a good many plants in a house which you should not propagate from under any circumstances; plants that have grown under unfavorable conditions,

and again those which have a tendency to go more to runners than flowers; others again which run to small flowers; some to slim stems, and so many of such things that a successful grower notes, as he picks his flowers and works among his plants. The fact is, that, to a certain extent, the careful grower feels that his stock to work from (or, rather, the stock he prefers most to propagate) is quite limited.

I think one of the reasons that we find so many growing violets with so little satisfaction can largely be laid to the door of hurried, careless propagation. In cutting the runners for the propagating bed, do not make them too long, as is frequently the temptation; one joint below the end is ample, otherwise the roots will be far away from the plant, and you will find it detrimental in the dry, hot summer weather, if not before.

You will find a few sufficiently rooted to prick out in flats (or pots, as you may prefer), as soon as taken off, but the most of them will have to be placed in a well firmed propagating bench of coarse sand, with a moderate bottom heat, but plenty of fresh, cool air overhead. Keep well sprayed with cool water, and you will be surprised at the rapidity with which they will strike root.

Do not let your spring work cause you to neglect to remove them from the bench as soon as they are struck, or else they become starved, getting hard and yellow, and stunted in their beginning, with the result that they are never what they should be, neither will they give the proper results. Of course they must be shaded for a few days after pricking out, and given plenty of cool, fresh air. Care must be taken also not to allow them to dry out and wilt, or they will lose all their vitality, and you will have to start with a new batch.

R. E. SHUPHELT.

House of the new Pink Carnation, Mrs. Francis Joost, at Mr. C. Besold's, Mineola, N. Y.

ROSE NOTES.

Propagating.

It is an excellent time now to propagate your rose stock for next summer's planting. As is well known I am not a professed professor on roses, growing but one or two houses, but in rooting them I have been uniformly successful and can see no reason why anyone should fail. Remember, if your stock is weakly, without vigor, and you have reason to complain with truth that your roses are a failure, then don't perpetuate your own stock. It will pay you a hundred fold to buy good, strong, healthy stock of a man who has grown fine roses. Give him what he asks for good stock; two cents on a 3-inch pot plant, may seem a consideration if you are buying a thousand, but it is nothing; one good bud on each plant will make it up three times over. I find a tea rose, particularly in January, February and March, takes in a bottom heat of 65 degrees and the house about 50 degrees, 18 to 25 days to root, and we do not lose more than we do of ageratum, which is none.

There is great difference of opinion about the size of the cutting, or rather the number of eyes. Every cutting should have two eyes, and if good wood was in abundance there would be no objection to three eyes, but two will do. Cut just below the eye and strip off the leaf, leaving the top leaf intact, or if that is very large, the top lobe of that can be cut off. I saw a bed of rose cuttings a few days ago that was fearful to behold. If half the cuttings had been pulled out the sand would have still been invisible. If fungus, rot and everything else does not get into that jungle it will be marvelous, and it was a place where they have been trying to grow roses for the past 7 or 8 years. You can put the cuttings fairly close, as you would anything else, but leave a little space for daylight and air.

When they have made a root of half an inch they should be potted and given the same temperature, or a little higher than the house they have been rooted in. This potting them just as soon as rooted is a good rule for most all cuttings, but particularly is it for roses, as the roots when allowed to grow long in the sand grow wiry and useless, and when an inch or so long easily break off when removing them from the sand.

The much discussed question whether a cutting should be taken from a blind shoot or the flowering shoot, is perhaps not yet settled to the satisfaction of everybody. There is a wide difference between qualities of blind wood. If it is stout and firm it is just as good as the wood from a flowering shoot, but if spindling and weak it is not fit to use for future stock. It seems that a man should know by instinct when the wood is in the proper condi-

tion to make a cutting. It must not be soft and brittle, as you would take a verbena, nor yet hard and woody. When the bud is about to open the wood is in the right condition, and blind wood can be judged accordingly.

If water passes freely through your propagating bed you can water daily, but in dull weather, and fire heat, not excessive, once in two days will be ample. When you do water the bed do it thoroughly. WM SCOTT.

EARLY PROPAGATED CARNATIONS.

In the fall I recommend the taking of a thousand or two carnation cuttings, either from plants in the field or from those lifted. We have two uses for these early struck cuttings. A thousand, say in four varieties, which with me are Daybreak, Scott, Portia and Alaska, p'anted out early and pinched but once, will begin to flower the latter part of July, and from that on till hard frost kills them, and you can well afford to lose them, for you will pick great quantities of good flowers from the field, and they are worth disbudding and trying as much as those indoors. You may think you can get a better variety than Portia, but you could not for the purpose. Small as it comes inside, it is very early and a fine flower outside.

The other purpose is that no plant is more asked for by your patrons every spring than a carnation that will flower during the summer. People are tired of asking for such an article, for the great majority of florists have nothing satisfactory to offer. If you propagated these in September, they should now be sturdy little plants and want a 3-inch pot, and be topped once. Another style of carnation plants that suits your customers finely is the small one left in the field after the houses are filled. A few hundred of these in variety, lifted at the end of September, well pinched back, potted into 5-inch pots and plunged into a cold frame, are wintering finely. It has been such a strange and largely open winter that there has never been a week that you could not freely ventilate one or more days a week, which has been of the greatest benefit to them, and when the weather will admit of it, ventilation should be given in abundance, not only to those, but to all plants that are wintering in frames.

Dahlias.

There seems a revival of interest in dahlias, and they are deserving of it. Too many people, even alleged florists, plant them out with no more care than they would a salvia. Their summer growth and culture I will endeavor to tell you about later. To increase your stock is now of most importance. If you have any roots lifted last fall and stored in a cellar where you could keep potatoes (which suits them admirably; cool, but not half a degree of frost), bring them up, place an inch of soil on the bench and put the entire roots on it, scattering some earth over the roots, but not covering deeply. They will send up a number of shoots, which, when three or four inches long, root freely. You can put them in 2-inch pots singly with a little soil at the bottom of the pot and plunge in propagating bed, or you can insert them in the sand in the ordinary way. Be sure to cut these dahlia cuttings just below and very near a joint. In most cuttings this is of no consequence, although just as well with all, but in dahlias it is most important.

Geraniums for Easter.

All kinds of plants, both cheap and expensive, are called for at Easter, and among them a few zonal geraniums in 4-inch pots. Select a few hundred of the early flowering ones, put them into a 4-inch pot and give them a light, warm house, and they will have a flower or two by Easter. Give them a much warmer place than you do your main stock of these useful plants, and near the glass, which means as much light as possible.

Easter Stock.

How do we look for Easter? I can't see yours, but I have studied my stock quite anxiously the past twenty-four hours. As remarked a month or two ago, cytisus must be kept near the freezing point for a few weeks or it will be too early.

If the lilies are showing clearing their buds when you read these lines, you are safe in a terperature of 60 degrees at night, but nothing to spare. Much will depend on the weather, but be safe, oh! be safe. Running it so close is nonsense. Have a good week to spare, and don't forget your patrons want the lilies full out. Save all the diseased ones to feed the next drummer who wants to sell you sound (?) bulbs.

The Bottle Brush plant (metrosideros) is coming on nicely at a temperature of 50 degrees. You can't get them to flower all at once, and it does not like sudden forcing.

Azaleas are going to be full early, excepting late sorts, like Emperor of Brazil. You can do much to retard them by a temporary shade of cloth or paper on sunny days and opening the ventilators above whenever possible. The azalea is a plant that the public exercises a little brains over, and prefer them not too full out.

WM. SCOTT.

OUR GENERAL INTRODUCTION.

No. 6.

Every subscriber is requested to send his photograph (cabinet size preferred) for use in our general introduction, but please do not send us photos that must be returned, as we have to cut them in arranging the groups.

OUR GENERAL INTRODUCTION. No. 6.

PHILADELPHIA.

Stock—Prices.

The cut flower market was in a more satisfactory condition during the week just ended, Feb. 7 to 12, than during the three previous weeks. Stock which was almost unaccountably scarce in certain lines, for the lack of sunshine and being off crop, hardly seemed to explain the declination of produce noticed in many cases, became more plentiful and resulted in a more satisfactory filling of orders, the demand remaining about the same.

The stock offered is pretty well cleared up each day, excepting the poorer grades and certain lines of bulbous flowers, notably valley and Von Sion. Prices are as follows: Beauties, extras, which are in rather short supply, $7.50 to $9 a dozen; good medium, $4 to $6; short, $1 to $3; Brides, Maids, and Meteors, a few specials bring $12, good stock $8 to $10; seconds, $6; Perles, $4 to $6. The Brides have sold about as well as the colored varieties, which was not the case earlier in the season. Carnations, a very few fancy sorts, seedlings of especial merit, are held at $4. They have large flowers and stiff stems that hold the bloom perfectly erect; good flowers of fancy sorts bring $2.50 to $3.

Valley goes slowly at $1 to $4. Romans are more plentiful, and bring $3 to $4. Tulips are good and not very numerous, but there are quite enough for the demand. La Reine brings $3; when well colored with pink, it sells best. The other sorts, yellow and scarlet, bring $4. California violets, 25 to 50 cents per 100; double, 50 to 75 cents; a few very fine, $1. Freesia bring $2, and double daffodils go slowly at $3 to $4.

There are growers who will read some item in the above list with a sigh or a groan. To them I add that our stock is so perishable that the least accident or a bit of carelessness will make these prices unattainable, to say nothing of the possibility of an absence of buyers when most needed. An uptown store had a large jar of nice looking Scotts in the window during the week marked 20 cents a dozen. It is hardly likely they cost the proprietor $1.50 a 100.

Special Plant Sales.

The plant trade in the stores is rather quiet just now. The storekeepers believe it is made so by the special sale of palms which took place at John Wanamaker's large department store recently. The firm offered an Areca lutescens, three plants, 24 to 30 inches high, in a 6-inch pot with a jardiniere, for $1.25, and it was claimed had sold 2,500 of them. The plants were of the 50-cent grade, and could undoubtedly be bought for less money in thousand lots. The jardinieres were supposed to be worth 30 cents; 60 to 75 cents each would therefore be a fair guess as to the cost of this merchandise offered at $1.25, which approaches very closely to the margin of profit which the regular retailers consider their legitimate due. The plants seen at Wanamaker's were not what any one familiar with our business would consider a good investment, many of them being in condition most unlikely to give the buyer satisfaction.

The retailers are very sore over these special sales, believing their business is thereby injured. I am disposed to adopt their view, but from different reasons. It seems to me that the putting of large quantities of stock, such as I saw last week, on the market will deter many would-be buyers of plants in the future. Rightly managed, I think it is an open question whether these special sales are not of benefit to the trade at large. They undoubtedly take some customers from the regular retailers for the time being, but they create a love of, and therefore necessity for, plants, which will prove of benefit to the retailers ultimately, for these are only special sales, and every other variety of plant offered was marked at a good stiff price.

Suppose a busy man or woman—thousands of them pass daily through the large department stores—fancies one of these palms with vase and takes it home. If it does well, is not he or she almost sure to want another for a friend, or to ask some question about its needs, and, the special sale being over, and the counter filled with, shall we say, laces, will not he or she naturally go to a regular florist, and, rightly managed, is not a new customer made in many cases? This view is for the retailer only, ignoring the grower's side of the question. I sincerely hope the matter will be freely discussed in the columns of the Review. J. W. Y.

CHICAGO.

Club Meeting.

At the last meeting of the Florists' Club, though not many retailers were present, there was a very interesting and instructive discussion upon the various phases of the retail business. The discussion covered a wide field and became especially vigorous over the question of pickled stock at the holidays. The committee of arrangements for the convention of the Carnation Society reported the details of their work up to date. Two new members were elected.

At the next meeting of the club, Feb. 24, Mr. J. T. Anthony will read a paper on "How to Market Cut Flowers."

The Market.

Market conditions have changed but little. The shortage of roses continues. There seems to have been some increase in the supply, but the demand is still in excess of it. Bulb stock is plenty.

Various Items.

A banquet with covers for 1,200 people was given at the Auditorium Hotel the evening of Feb. 12 (Lincoln's birthday) by the Marquette Club. The speakers included ex-President Harrison and Secretary Gage. The decorations were by Mr. P. J. Hauswirth, and were very handsome. On the speaker's table appeared numerous plateaus of the "Novelty" tulip arranged with ferns, while on all the tables were scattered flowers of the same tulip and Scott carnations. No less than 2,000 flowers of the "Novelty" tulip were used. The effect was admirable.

Mr. O. P. Bassett, of Bassett & Washburn, spent a few days at West Baden, Ind., early in the week.

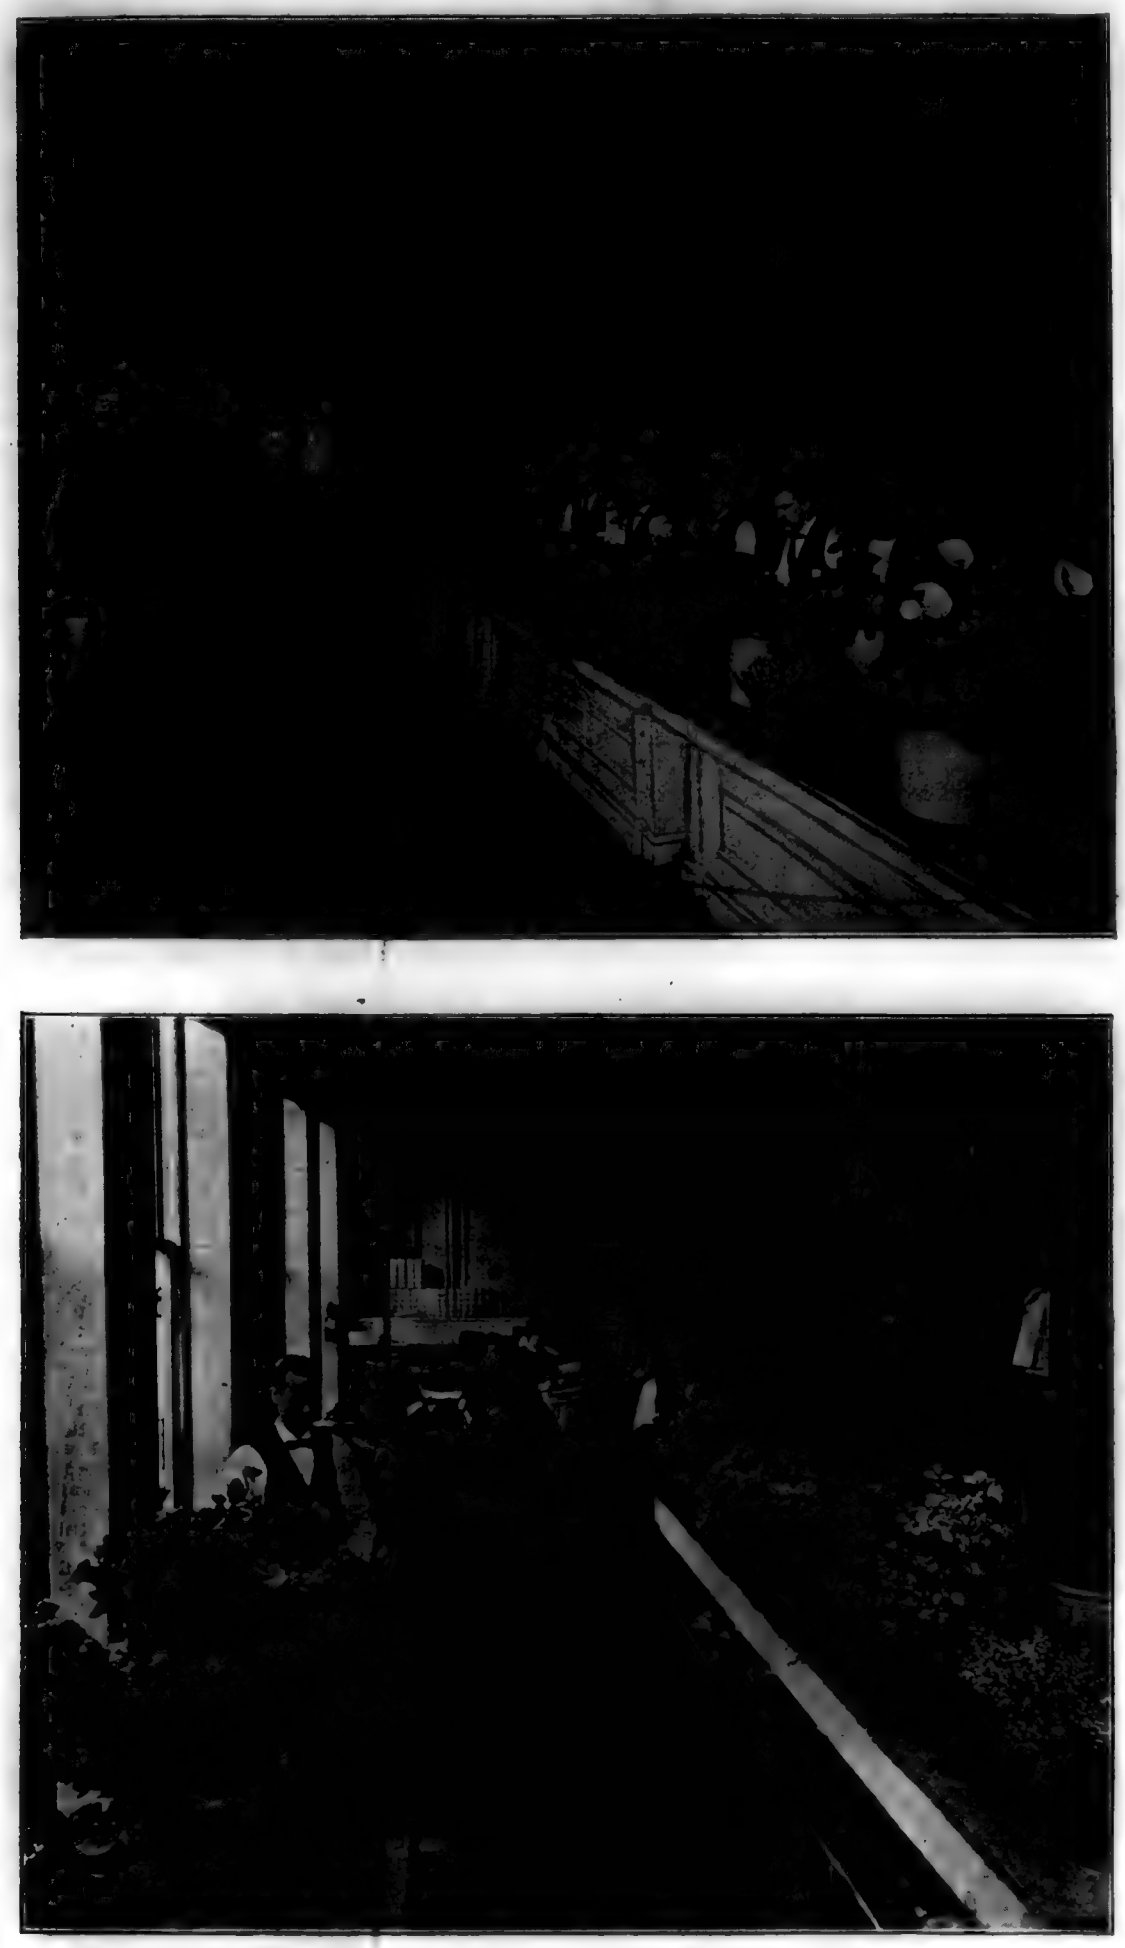
Mr. G. H. Pieser, of Kennicott Bros. Co., left last Saturday for a two weeks trip through the south.

Bassett & Washburn are cutting some very fine Harrisii lilies and have a large crop coming on.

The Executive Committee of the Hort. Society of Chicago has adopted the premium list for the annual exhibition next November, and the preliminary printed list will soon be issued.

Dan McRory, representing W. A. Manda, South Orange, N. J., was a recent visitor.

BOSTON.



Club Meeting.

The postponed meeting of the Florists' and Gardeners' Club was held Tuesday evening. The question of the annual dinner was discussed and it was finally decided to lay the subject on the table for an indefinite period. The club then enjoyed a lecture by Mr. Robt. Farquhar on "The Great Northwest, Oregon, Washington, and Indian Life on the Pacific Slope," which was supplemented by 130 beautiful stereopticon views. It was a most enjoyable and instructive trip upon which the audience was taken by the lecturer, and at its conclusion a unanimous vote of thanks was tendered him.

Mass. Hort. Society.

At a meeting of the Executive Committee of the Mass. Hort. Society on Feb. 7, the desirability of looking for more commodious premises was considered. It is said that favorable consideration was given to a new location for erecting a new building that will be large enough to avoid crowding at exhibitions as often happens at present, the structure to contain offices, lecture rooms, etc., in addition to exhibition halls. The plan contemplates the disposal of the present building, which is now far too small for the needs of the society.

The weekly exhibition last Saturday was rather small and owing to the inclemency of the weather was only moderately attended. Mr. James Comley, superintendent of the Hayes Estate, Lexington, came out with quite a large exhibit of camellias in about 50 varieties, Coelogyne cristata, Begonia fulgens and Cypripedium insigne, for which he was awarded a gratuity prize. Wm. W. Lunt, Hingham, showed some well grown flowers of Cyp. Wm. Wallace Lunt, for which he received a first class certificate of merit. Carl Blomberg, gardener for Oakes Ames,

Glimpses of the Wholesale Store of Messrs. Bassett & Washburn, Chicago.

four varieties of anthuriums, which were very attractive. H. T. Clinkaberry, gardener to C. G. Roebling, Trenton, N. J., showed a very fine Cattleya Trianae Emily M. Roebling, very large well formed flower and excellent color, for which he received honorable mention. Mr. J. E. Rothwell, Longwood, exhibited a very fine plant of Cypripedium Sallierii Hyeanum with 15 growths and 7 flowers, also Cyp. concolor and Cyp. nitens superbum. W. H. Spooner, Jamaica Plains, showed a vase of the good old rose, Gloire de Dijon.

A very interesting lecture entitled, "New Notions About Old Insects," was delivered by Prof. M. V. Slingerland, of Cornell University, Ithaca, N. Y.

Various Items.

Mr. P. Welch, of Welch Bros., has been confined to his home for several days with a severe cold.

Norton Bros. report good business the past week. They had several important decorations. Houghton & Clark also report an improvement in the call for decorations. James Delay reports a decided gain in business.

Mr. A. P. Calder is cutting Cherokee roses in quantity and they find a ready sale.

The wholesale cut flower market remains about the same as last week as regards prices, though there is more demand. Violets are still a drug and are largely handled by the street fakirs.

Welch Bros. are receiving consignments of orchids twice a week. They include some remarkably fine Cattleya Trianae which meet with ready sale.

C. H. J.

BUFFALO.

Flowers for Valentines.

Nothing startling to record of late. We hear of a cut in some flowers. "Tulips are 75 cents per dozen, madam." "Why, I can get them at So and So's for half a dollar. How much are your carnations?" "Fifty cents, madam." "Oh, dear! you are high; down the street they ask only 35 cents." And so it goes. Sometimes it's the truth and sometimes it's pure cussedness, and a mean way of getting a thing cheap. The weather is not fine enough, and too little sun to make much of a glut. Violets are getting plentiful, but they are usually all used up, and particularly to-day, for 'tis St. Valentine's day of happy memory, when our hearts palpitated at the postman's knock and our few pennies were spent in some modest little Cupid and the original lines, "The rose is red," etc. We did not have funds enough to buy a bunch of violets for her, and flowers were very little used then. We now think the most seasonable valentine is a box of flowers or pretty plant.

Business Changes.

We hear that W. Scott has rented the store at 546 Main street, two blocks further uptown and a much more commodious place to do business. W. A. Adams is likely to move into 479 Main street.

There will be at least three start for Chicago Wednesday, and we hope to make it four. The Nickel Plate is the road selected.

Various Notes.

Messrs. Wise, of East Aurora; Hewson, of the Abbott Road; young Mr. Lewis, of Lockport, and Prof. Cowell, have all been making a pilgrimage to Corfu and Darien of late to see Genesee on its native heath. They all exclaimed, "That is good enough for me."

It certainly, when growing, has a superb appearance.

It's always extremely pleasant to have a call from the patriarch of the trade, and W. J. Palmer, Sr., and the writer spent two hours this morning in exchange of ideas, but the time was chiefly occupied in cussing the Dutchman that sold us our La Reine tulips. We know him, and have him spotted. The several men who supplied us with diseased Bermuda lily bulbs came in for a general condemnation, for they are all guilty.

The Atlantic Packers' Association met here last week, and that brought many of the supply men to town, among them W. R. Roach, representing Jerome B. Rice & Co., seed growers, of Cambridge, N. Y., and several other places. Mr. Roach shows keen intelligence. He knew enough to buy liberally of flowers and read the Florists' Review.

Wm. F. Schmeiske, of Wilkes Barre, was recently in town. He has dissolved partnership with A. W. Moore, and is looking around for a business opening, and there is good reason to believe Mr. Wm. F. S. will shortly be enrolled among the retail florists of our city.

W. S.

WASHINGTON.

Trade Resume.

Usually the week preceding Lent is the gayest in social circles and there is no reason to believe that the coming week will differ from former seasons. The orders booked ahead by the florists indicate an exceptionally lively week to come. The week past has kept up the pace of its predecessor and went it one better. There were really more entertainments, but none calling for any special decoration.

The effect of the bright and summerlike weather of the past week is plainly visible in the quality and quantity of stuff coming in; the outside temperature reaching 70 degrees in the shade. Prices are holding their own, with the exception of violets and slight changes toward the lower in bulbous stuff.

Mr. Bissett, foreman for Mr. J. R. Freeman, continues to send in the finest Bridesmaids grown in this vicinity. For color, size of flower and length of stem they are all that could be desired. His Scott carnations are equal to the best northern grown. He is adding several new varieties to his list this season and intends discarding White Scott, Portia, Mrs. Thompson and others. He is much pleased with the Farquhar violet, claiming not only are the flowers larger and stems longer, but that they produce twice as many blooms as Marie Louise.

Notes.

Mr. J. E. Killen, representing Mr. C. H. Joosten, of New York, was in town last week and attended the last meeting of the Commercial Florists' Association. He seemed much surprised at not seeing Mr. Wm. Gude present. He gave a very interesting talk about similar troubles in other cities, citing St. Paul and the successful efforts of the florists of that city in breaking up and compelling an industrial institution, supported by the state, from entering and competing with them in the open market.

At the dinner given by the vice president and Mrs. Hobart the plants for the decoration were borrowed from the White House conservatories. A few strings of smilax and a few dozen roses purchased from a florist, and any deficiency in quantity was made up in the use of artificial flowers. The wall plaques and a mantel or two were decorated with artificial roses and were partially hidden by plants. The person who furnished the extras was asked, on the strength of the purchase, to do the decorating.

The order prohibiting visitors from visiting the Government houses at the Monument grounds, continues in force so far as the committee is concerned.

Col. Clay, president of the U. S. Reform School, made the remark to a member of the Florists' Association who called on him to ask his assistance in checking the sales of the products of that institution in the open markets in competition with the florists, "that we (the florists) ought to be indicted by the grand jury for combining to hold up the prices, and he, for one, would be glad to see it done."

W. H. K.

BALTIMORE.

Business Conditions.

Business being quite up to the standard, there was little or no complaint heard from the florists this week. The close proximity of the Lenten tide has no doubt greatly augmented the number of balls and receptions which took place the past few days, while at the same time it has hastened the booking of many large affairs which are yet to follow before the social season sinks to rest.

With the weather's sudden transition from cold to warm, good stuff has become plentiful again and quite up to the demand, with little or no change in prices over last quotations. Violets, however, deserve special mention, both for quality as well as popularity. In observance of the near approach of St. Valentine's day, the stores are making an unusual display of tasty floral arrangements and novelties, which seem to take the public's eye, and sell well. Owing to the bright and balmy weather, there was an unusual crowd of promenaders about the markets Saturday afternoon, and the florists seemed particularly busy.

Notes.

To prevent further misinterpretation, the writer begs to state that in his last letter to The Review, he simply wished to correct an error, and it was not his intention to even imply that Mr. E. A. S. of the "Exchange" had committed any breach of confidence whatever.

Mr. M. Rice, of Philadelphia, was with us several days on his trip west.

C. F. F.

TORONTO.

Canadian Hort. Society.

The two great events in horticultural circles here last week were the meeting of the Canadian Horticultural Association and the eighth annual dinner of the local Gardeners' and Florists' Association. As regards the former, it must be said that the meeting was not attended by as many as was expected and hoped for by the promoters, but it must also be said that what was lacking in numbers was more than fully made up by the enthusiasm and earnestness of those present. The S. A. F. & O. H. (the secretary should supply rubber stamps for this title), I believe, was started in a similar manner, and I have no doubt that the first convention of the C. H. A. will be as successful as theirs was at Cincinnati in 1885. I cannot perhaps give a better account of what was done at the meeting than by sending you a clipping from one of the daily papers of the 11th inst.:

The members of the Canadian Horticultural Association met yesterday morning in St. George's Hall to complete the organization which was entered upon in November last. The president pro tem. Mr. Wm. Gammage of London, was in the chair, and among those present were: Mr. Hugh McLean, St. Thomas; Mr. Fred. Mitchell, Innerkip; Mr. Fleck, Mount Forest; Messrs. J. H. Dunlop, George Vair, E. H. Carter, A. H. Ewing and others, of Toronto.

Mr. Gammage, in addressing the meeting, said that the value and need of associated effort is recognized in all professions and trades, and none needed it more than they did as a profession; it encouraged trade, promoted harmony, incited our aspirations and begot fellowship. These were some of the fruits to be derived from associating. He asked them then to pledge their fealty to the association, and let no opportunity pass wherein they could extend its usefulness. They did not come together to organize a trades union, nor to fix a scale of prices, or to form a trust; there was no sinister purpose in their coming together. They were seeking knowledge, and it was for mutual conference and consultation, and to exchange ideas and compare methods respecting the progress made in the aid to nature in producing horticultural products. By this exchange each would become possessed of the knowledge of all, and return to his field of labor and business the better qualified for further improvement during the coming year.

Continuing, Mr. Gammage referred to the fact that not one time in ten was the original idea of the government grant fulfilled in horticultural societies. This was the result of indifference or owing to the influence of political ringers. He laid stress also upon the need of a purely Canadian horticultural journal.

In the afternoon session the organization was perfected. The first business transacted was the election of officers. Those chosen were as follows: President, Wm. Gammage, London; first vice-president, E. G. Foster, Hamilton; second vice-president and vice-president for Quebec, Joseph Bennett, Montreal; secretary, Hugh McLean, St. Thomas; treasurer, John H. Dunlop, Toronto; vice-president for Ontario, T. H. Carter, Toronto; executive board for three years, Thos. Manton, Toronto; Fred. Mitchell, Innerkip; H. H. Groff, Simcoe. For two years, Harry Dale, Brampton; Charles Scrim, Ottawa; G. W. Mills, Toronto. For one year, A. H. Ewing, Toronto; Walter Muston, Toronto; Orlando Johnston, Kingston.

The by-laws were then discussed and decided upon, a great amount of detail work being done. The meeting adjourned about 5 o'clock.

The place of meeting for the first convention will be Toronto during the second week of the Industrial Exhibition. This decision was reached after

a long discussion; several other places were named, but though their suitability was not denied, it was thought that on account of the cheap railway rates to be obtained at the time, as well as the other attractions, a much larger representation could be gathered together for the inaugural convention if held here at that time than at any other place, and that the association could be given a better "send-off," as it were. Persons wishing for a copy of the by-laws or other particulars should write to the secretary, Mr. Hugh C. McLean, St. Thomas, Ont.

Dinner of the G. and F. Association.

The second event—the dinner—was held on the same evening, and was in every way a great success. The decorations were very pretty, orchids being very much in evidence, coming principally from the Horticultural Gardens conservatory. Two pans of Coelogyne cristata and two of Dendrobium nobile were magnificent. Manton Bros. sent some ferns and orchids, and there were some ferns from the Normal School greenhouses. Mr. J. H. Dunlop sent a magnificent center piece of Meteor roses and asparagus. Some fine azaleas, also from the gardens, were very showy. Of the dinner itself and the liquids nothing but praise can be said. The speeches were above par, the songs and music the best that have been heard at these dinners yet.

Mr. W. Lawrence's "Death of Nelson," Mr. Verral's "Boys of the Old Brigade," Mr. Alf. Rubbra's "Prodigal Son" and stump speech, Alderman Score's "Land of the Maple Leaf," and ex-Alderman Preston's patriotic Canadian speech seemed to catch the boys just in the right spot, and were received with "tumultuous applause." There were four aldermen present, and all made speeches but no one seemed inclined to indulge in "excursive prolixity." Alderman Score, mentioned above, is now chairman of the parks and garden committee of the city council in place of Alderman Hallam.

And now I want to do a little scolding. Several faces of those well known in the trade, and for whom there is no excuse for not attending, at least for an hour or two, were not to be seen at the table. These kind of things are not got up simply for the purpose of "guzzling and gormandizing." There is another and higher purpose, which these gentlemen know all about without my telling them. They appear to be quite willing to take all the benefits which accrue from the association's work in keeping horticultural matters before the public, etc., and are quite willing to give any amount of advice and criticism in their stores and potting sheds, but to give up anything—time, money, comfort, pleasure, prejudices or jealousies—for the sake of the good work does not seem to enter their heads. I call it, to use a mild term, a very selfish way of doing business. I admit that the association might do more than it does to improve things, but it should be remembered that it has done a good deal, and if it only holds a flower show once a year it has a very good excuse for existence and deserves every assistance. With more encouragement it could do more efficient work. These annual dinners, held at the best place in town, are one means of "holding our end up," to say nothing of their social use in the fraternity, and all should make it a point of attending who possibly can. Surely we could forget all our little petty differences for one night in the year. I trust these remarks will be received by those whom the "cap fits" without offense—none is intended. I merely make them as a reminder that they owe something to the organizations that are doing their best to raise the standard of horticulture and horticulturists in this city.

Business Fair.

Business last week was in the aggregate not at all bad. Several pretty big affairs came along, and the general demand was fairly lively. Bulbous stuff is still plentiful. The weather was comparatively mild and all the snow is off the ground again, ready to receive more. E.

ORANGE, N. J.

Club Meeting.

The New Jersey Floricultural Society held its regular monthly meeting the evening of February 7, and it was well attended. The discussion upon the advisability of holding a spring exhibition consumed considerable time. Ladies of the Orange Improvement Society having asked to work in conjunction with the society's members to make same a success, a committee was appointed to interview the ladies and ascertain how far they were willing to be financially responsible. With the extreme wealth of the Oranges and their wonderful floricultural resources a grand exhibition and success should be the result.

Discussion.

The next subject taken up was the bill now before the New Jersey senate governing the importation of trees, plants, shrubs, vines, grafts, cuttings and buds, and the rules and regulations for the inspection of trees, plants, shrubs, vines, grafts, cuttings and buds, commonly known as nursery stock, grown within the United States, which become subjects of inter-state commerce on exportation, which is to prevent the introduction into and the spread of injurious insects in New Jersey and to provide a method for compelling their destruction.

The bill was discussed from every conceivable point. It was generally conceded that the best way to settle the various arguments was to appoint a committee to thoroughly investigate the bill and to present objections to their representative. This was done and the club will have a say before the bill passes its third reading.

An Interesting Discourse.

Mr. H. S. De Forest, of Hitchings & Co., then gave a very interesting discourse on Greenhouse Construction, which was ably discussed by Mr. Kitchen, W. A. Manda, F. L. Atkins, and others. Many new points were brought out and much interest was taken by every one present.

Exhibitton.

Mr. Kitchen had on exhibition an individual flower of a new carnation—scarlet sport—from Mrs. Bradt. This ought to prove a good thing.

A pretty exhibit of carnations was made by Robt. McArthur, Mrs. Bradt being shown in elegant form. Certificates of merit were awarded for this display.

The meeting closed, everybody feeling satisfied that the evening had been well spent.

ST. LOUIS.

The Florist Club.

The Florist Club held its regular meeting on Thursday afternoon at 3 P. M. President Halstedt or Vice-President Ude were not present owing to important business at home, and Ex-President Fillmore was selected to fill the chair, with 30 members present. Three new members were elected to membership, W. E. Jordan, Fred Meinhart and Fred Billinton. Applications for membership were received from the following florists: W. L. Hucke, A. E. Michel and Fred W. Weber. Essays were next in order. Mr. John F. Ammann, of Edwardsville, Ills., Andrew Meyer, Sr., and R. F. Tesson, each read their essays and received great applause from the members.

Mr. William C. Young read an article from The Florists' Review of January 13 on "Work for Florists' Clubs," as read by Mr. John Jones before the Morris County Florist Club, that brought out a great discussion which will be continued at the next meeting of the club.

It was decided that the president should appoint, some time before the next meeting of the club, three competent judges to act as judges at our annual carnation meeting on March 10 at 2 P. M. A certificate of merit will be given to all those deserving. The meeting then adjourned to enjoy a smoke at the Mercantile Club.

The Smoker.

Some thirty-five florists attended the annual smoker given by the club. The committee, Messrs. Beneke, Young and Fillmore, had everything in readiness when the party arrived. The two large rooms, known as the blue rooms, the best in the house, were used for the occasion. First on the program were refreshments and cigars, after which the chairman called order. In the absence of President Halstedt, Vice-President Ude was called upon for a few remarks for the good of the club. Mr. J. F. Ammann then sang his new song, "Bring Back Some Gold." This song

Mr. Ammann dedicated to the St. Louis florists who went to Klondike last week. Mr. Carl Beyer did some fine acrobatic work. Mr. J. J. Beneke sang a few comic songs, as did Al Bauer. Frank Fillmore, Sr. and Jr., both sang and told funny stories. J. W. Kunz was down on the program for a flying trapeze without a net, but fell and was badly hurt. This put a damper on the entertainment for awhile. Dr. Helwig, the club's physician, was on hand and soon had the old sport in good shape again to continue the entertainment, and after a grand cake walk by all present the party broke up to bowl a few games.

Market Review.

The cut flower trade since last writing has not been so brisk, but the wholesale houses claim they had good trade all week. Cut flowers are not over plentiful and few good orders were placed for St. Valentine's day.

Beauties continue scarce and really first-class stock cannot be had. Meteors, Maids and Brides are selling for the best from $6 to $8. Perles and Woottons go at $3 to $5. The best Perles come from J. F. Ammann and the fine Woottons are grown by Fillmore. All the best roses are in excellent demand and bring top prices.

Carnations, fancy varieties, bring $2.50 to $3. Scotts, Daybreaks and any kind of red sell at sight. The fine Eldorado grown by H. Aue bring as high as $5 per 100.

Valley is now in good form at $4. Romans, daffodils and tulips are moving better and sell at $4. Callas are plentiful at $8 and $10 and Harrisii are still selling at $12.50. Violets continue to come in in great quantities to this market and are selling very cheap. A few days of warm, bright sunshine brought out a few florists to the market with plants and they claim that they sold out in short order.

Notes.

Fred Ostertag has given up his store on Vandeventer avenue and has left town.

Only about six, and perhaps ten, of our florists will attend the carnation meeting this week at Chicago.

The committee for this year's show will meet again on Saturday night at the same place to work on the preliminary list.

Visitors in town this week are Robert W. Greenlaw, with N. F. McCarthy & Co., Boston, Mass., and Mr. Klehm, of Chicago.

The Bowlers.

At the Bowling Club Monday night the attendance was a little slim, but the few that were on hand rolled the usual three games. C. A. Kuehn was high man with 604, high single score 221; Beneke, second with 549, high single score 212; E. Schray third, 539, single score 189. Mr. Gus Eggleing, the South Grand avenue florist, was a visitor and rolled with the boys. Next Monday night we expect to celebrate a birthday and all members are requested to attend. J. J. B.

COPYRIGHT 1898.

NEW YORK.

The Florist Club.

At the regular monthly meeting of the New York Florist Club, Monday evening, about seventy members were present, and will rank as one of the most successful in the club's history in point of numbers, new members elected and proposed, business done, and the excellent lecture delivered by Mr. John K. M. L. Farquhar, of Boston, and not forgetting the exhibits which were exceedingly good.

Mr. William Plumb, the president, was in the chair and, after the minutes were read, the following gentlemen were elected to membership: R. Ulrich, R. L. Cottenet, Charles Schenck, Charles Millang, F. H. Traendly, H. A. Bunyard, William Elliott, J. M. King, J. P. Cleary, Theodore Lang, J. K. Allen, Charles Trauth, all of New York; and the following new members proposed: John Finn, W. H. Gunther, E. R. Lucatos, Peter McKenna, J. Cook, W. S. Lee, James McManus, Joseph Fleishman, all of New York City; R. McMillan, Pearl River, N. Y.; C. H. Flemming, Bridgeport, Conn.; J. R. Mitchell, Stamford, Conn.; Fred Boulon, Seacliffe, L. I.; J. P. Mallon, Brooklyn; Fred H. P. Imbert, Woodridge, N. Y.

The committee which visited Patchogue, L. I., on the invitation of Mr. Frank Niquet, reported on the carnation show at the previous meeting, and now known as "Maud Adams," and awarded the following points: Size 10, form 20, substance 20, color 20, stem 10, foliage 10, rarity 5, fragrance 5, a total of 90 points. The committee consisted of J. N. May, L. Hafner and Alex Burns. The committee recommended a certificate of merit, which was unanimously awarded by the club. The color is a beautiful cerise and the flowers measure three inches, with fine, stiff, erect stem of great length.

The committee of awards on exhibits then read its report and suggested the following new rules, which were adopted:

Rules and Regulations Governing the Competition of the New York Florists' Club Medals.

The exhibition to take place at every meeting of the Club during the year 1898.

Intending exhibitors should notify the secretary at least one week before each meeting, of their intending exhibit; also approximate amount of square feet required.

The limit for the space for the exhibits to be as follows: except by special permit, when an exhibitor intends to make an extraordinary exhibit.

Cut flowers, 20 square feet.
Pot plants, 50 square feet.
Decorative and made up work, 25 square feet.
Manufactured articles, 35 square feet.

All the exhibits are to be staged and in position by half past five o'clock on the evenings of the meetings of the Club.

All the exhibits are to be properly labeled.

The exhibitors should hand as an entry, a correct list of their exhibits to the secretary, who will give them a number, by which alone said exhibits shall be known until after the awards have been made and announced by the secretary.

The Judges are to finish the judging of the exhibits before the opening of the meeting, during which time no one will be allowed in the room except the Judges.

The decision of the Judges shall be read by the secretary during the meeting, giving in detail the points scored and any exhibitor having any protest to make against the Judges, same should be made before the close of the meeting, but in all cases the final revision by the Judges shall be final.

A committee consisting of six members shall be appointed by the chair, selecting one expert, in each of the six different classes.

The Judges shall award Certificates of Merit to deserving exhibits at each meeting and the holder of the largest number of Certificates at the end of the year shall be entitled to the Gold Medal and the second largest number to the Silver and the third the Bronze Medal.

No exhibit shall be entitled to a Certificate unless it scores at least 85 points.

All exhibits must be divided from each other by a chalk or other mark.

No one individual plant shall be exhibited more than once at any meeting of the Club during the year.

Inferior exhibitions to be excluded by the committee.

Manufactured plants of all kinds to be excluded from this competition.

Among visitors in town were Chas. H. Flemming, Bridgeport, Conn.; John G. Esler, Saddle River, N. J.; Edgar Nock, Providence, R. I.; C. H. Perkins, Newark, N. Y.; John K. M. L.

Farquhar, James F. M. Farquhar, Boston; John R. Fotheringham, with F. R. Pierson Co., Tarrytown, N. Y.

The vanguard of the Holland bulb men have arrived; two of them, Mr. Grawvel, with Speilman & Son, and Mr. B. Kaptein, were on the ill-fated Veendam, and had a thrilling experience. Mr. P. Vos, of the Holland Bulb Co., has also arrived, but came per S. S. Saale.

Mr. Patrick O'Mara visited Washington last week with reference to House Bill No. 8694, mentioned in another column, and succeeded in having an amendment inserted exempting florists' stock, which we hope will be permanent.

Mr. Patrick O'Mara addressed the club with regard to the several bills before congress and the New Jersey and New York legislatures affecting florists, inasmuch as though the bills were really aimed at the San Jose scale, Peach Yellows and Peach Rosette, florists' stock really comes under the ban and, if passed, would cause endless trouble to the trade. On motion it was decided to appoint the following members, to act as a legislative committee, to visit Trenton, Washington and Albany, and to appear before the several committees, to protest against any legislation that might act as a detriment to the florist trade: Patrick O'Mara, John N. May, and C. H. Allen.

The dinner committee reported that over 50 members had promised to attend on the 26th and present indications are that it will be a "hummer."

Mr. Chas. Allen then introduced the lecturer for the evening, Mr. John K. M. L. Farquhar, who gave an extremely interesting talk on "The Bulb Gardens of Holland and Plant Life in Jamaica," illustrated with a collection of beautiful photographic stereopticon views, many of them taken by himself. Mr. James F. W. Farquhar, his brother, attended to the practical part, while Mr. "Alphabet" Farquhar guided us through the canals and bulb fields of Holland, illustrating the various modes of growing and propagating of this immense branch of horticulture, of which nearly $5,000,000 worth are exported every year. From thence we were taken to France and introduced to Mr. Peter Crozy, of canna fame, through picturesque Switzerland, the gardens of Kew, London, and some horticultural establishments, thence to Jamaica, the home of tropical fruits and flowers, where Mr. Farquhar travelled from end to end. The lecturer was listened to with rapt attention and his concluding sentences were greeted with a burst of applause. A hearty vote of thanks to him was unanimously accorded and it was the sentiment that it was a most enjoyable evening's entertainment.

The Exhibit.

Mr. H. C. Steinhoff exhibited some well flowered azaleas of the following varieties: Deutsche Perle, Vernaeneana, Paul Mardner.

Siebrecht & Son staged two nice pieces of dendrobium, the Cliftondale variety of nobile and Wardianum; the former very rare.

W. A. Manda showed Cattleya Trianae coerulescens, C. Trianae alba, C. Trianae var., Dendrobium Dominianum, D. Ainsworthii and variety alba; all in flower and nice specimens, and a variegated form of Geonoma gracilis.

T. W. Weathered's Son exhibited a section of their model greenhouse, iron and wood construction, which for simplicity and utility will certainly find favor.

Mr. F. L. Atkins showed a sample of the "Brazilian Tonic Plant Food," an odorless fertilizer that looks like snuff and will be used largely when better known, as it contains all the best ingredients for a plant food.

Mr. C. W. Ward exhibited an excellent collection of carnations of his well known varieties that were much admired.

Mr. Frank Niquet sent a vase of his new carnation, Maud Adams.

New York Gardeners' Society.

At the regular meeting of the above association held in Mott Memorial Hall, Saturday evening, Mr. William Scott, of Tarrytown, in the chair, the usual routine business was transacted. A paper was read by Mr. A. Wengarter for Mr. E. Runyon, president of the Elizabeth Nursery Co., on Trees and Shrubs; Their Selection and Management, which was well received and was accorded a hearty vote of thanks.

There were several exhibits. Mr. C. W. Ward showed some of his usually fine carnations, including the following varieties: General Maceo, Bon Ton, John Young, Blush, New York, Mrs. G. M. Bradt, Golden Nugget, White Cloud, Mrs. James Dean, Flame, which were awarded a certificate of merit.

Mr. Joseph Towell, Paterson, N. J., exhibited his new seedling from Daybreak, Governor Griggs, very similar to the parent, but much more fimbriated and slightly deeper in color; awarded a certificate of merit.

Mr. A. Wengarter, Bay Ridge, N. Y., gardener to G. W. Bliss, exhibited some specially well grown carnations of the following varieties: Bouton d'Or, Diaz Albertini, Mrs. G. M. Bradt, Mrs. James Lane, seedling Diaz Albertini, William Scott and Mars, seedling from Moladach; collection awarded a certificate of merit.

Mr. W. Bartholomae, the able secretary of the association, showed some forced Forsythia Fortunei, and Deutzia gracilis; awarded honorable mention.

Our Special Wholesale Report.

Milder weather conditions have operated to bring in an adequate supply of all varieties of stuff. Trade has not kept pace with the increased amount and a recession of values has taken place ranging from 25 to 50 per cent. The demand has been slow and uneven since the 7th, which is all the more disappointing when it was expected that the two weeks preceding Ash Wednesday would prove to be good.

Maids and Brides show a falling off in quality and the proportion of long straight stems is less than a week ago. The color is not so good and the flowers are soft. Other varieties seem to have suffered less. The cut of Beauties has largely increased though the special size is yet a little shy in blooming. The larger part are short stems; on these the price is low.

Carnations have held their own better than roses, but the price on them is not firm. The violet crop is on and shipments are heavy, so that it is not possible to clean out except at low figures. Bulbous stock is a glut. Harrisii, tulips, Van Sion and freezias are at a discount. Smilax and adiantum sell at fair figures. Valley is doing no better with a tendency to lower figures; for prices see market report.

Various Notes.

Mr. John M. Hunter, who was recently manager of the estate of H. V. R. Kennedy, Hempstead, L. I., has been appointed superintendent of parks at Paterson.

Mr. J. W. Scallen, the well known Broadway florist, will move to 1246 Broadway, a very spacious store, May 1st. This is getting to be the center of the shopping district now and it will doubtlessly be a very judicious move. I noted in his window some of the new rose Mme. Chatenay, and Golden Gate, also a new pink carnation Ada Rehan, very attractive and of good color.

CINCINNATI.

The Florist Club.

The regular monthly meeting of the Cincinnati Florists' Society was held last Saturday evening, with President Witterstaetter in the chair. The Chicago trip was discussed and the boys are still in favor of going via the C., H. & D. Upon motion it was resolved to procure a crayon portrait of the late Robt. J. Murphy to adorn the meeting place of the club. The secretary was instructed to notify the delinquent members to pay up within sixty days or they would be dropped from the register. Mr. Witterstaetter reported that he had secured badges for all who intended to attend the convention.

The Exhibit.

The monthly exhibit of plants and cut flowers was as usual a success. Mr. C. W. Ward, Queens, L. I., Mr. Wm. Swayne, Kennett Square, Pa., and H. Weber & Sons, Oakland, Md., were outside contributors. The new rose Mrs. Robt. Garrett, was highly praised and admired by all.

Messrs. George & Allen were as usual in the lead with a fine collection of roses. Their Meteors, Brides and Maids were A No. 1, as was also their bulbous stock, which made a grand display.

The City Greenhouses had a small collection of orchids which, as usual, proved an attraction for the ladies.

Their cyclamen in 6-inch pots, were well done and worthy of note.

A. Sunderbruch's Sons made a general display of plants and cut flowers. Some choice palms in the background with foliage and blooming plants, with several vases of lilies interspersed made the display attractive and complete.

Corbett & Wilson showed some Princess of Wales violets with stems 7 to 9 inches long. Their Marie Louise were also very good.

Wm. Murphy had fifteen standard varieties of carnations on exhibition, including Emma Wocher, Mrs. Geo. M. Bradt and Jubilee.

Trade Brisk.

Trade is quite brisk and all stock is going well at good prices. The supply is still insufficient to meet the demand. Bulbous stock is moving quite lively in consequence of the shortage of roses and carnations.

Recent visitors: R. W. Greenlaw, representing N. F. McCarthy & Co., Boston; Wm. Dykes, representing Ed Jansen, New York; A. L. Vaughan, of Vaughan, McKellar & Winterson, Chicago; T. C. Joy, Nashville, Tenn.; E. G. Hill, Richmond, Ind. B.

JADOO FOR CARNATIONS.

Mr. Albert M. Herr, Lancaster, Pa., has been experimenting with the Jadoo Fibre in propagating carnations and is so well pleased with the results that he will next season use the Fibre almost exclusively for this purpose. Evidently there are many uses to which this material may be put to advantage.

PATERSON, N. J.—At the meeting of the Paterson Florists' Club, Feb. 16, Prof. Byron D. Halsted, of New Brunswick, N. J., read a paper on "Injurious fungi in the greenhouse."

WANT ADVERTISEMENTS.

SITUATION WANTED—As foreman in good florist establishment. First-class rose grower, also palms, ferns, carnations, mums, violets and general stock. Or take charge of a gentleman's good private place, 20 years experience in England and America. Strictly temperate. Good wages expected. Married. Disengaged about March 1st. Good references. SINGLE TUBEROUS BEGONIAS

DREER'S "SPECIAL OFFER" OF Seasonable BULBS and TUBERS

TUBEROUS-ROOTED BEGONIAS AND GLOXINIAS. Now is the time to plant for early flowering. Our strain this season is even superior to that supplied by us in the past, having secured control of the stock of two of the most successful European growers, same having been personally inspected by us while in flower.

SINGLE TUBEROUS-ROOTED BEGONIAS.

Separate colors—Crimson, Scarlet, White, Rose, Yellow and Orange.
50c. per dozen, $3.00 per 100, $25.00 per 1000
Choicest Single Varieties in Mixture—40c. per dozen, $2.50 per 100, $20.00 per 1000.

DOUBLE TUBEROUS-ROOTED BEGONIAS.

Separate colors—Scarlet, Rose, White and Yellow.
$1.25 per dozen, $10.00 per 100, $90.00 per 1000
Choicest Double Mixed—$1.00 per dozen, $8.00 per 100, $70.00 per 1000.

GLOXINIAS.

A Superb Strain in Choicest Mixture—75c. per dozen, $5.00 per 100, $40.00 per 1000.

FANCY LEAVED CALADIUMS.

Choice Named Varieties, in 25 sorts—$2.00 per dozen, $15.00 per 100.
Choice Mixed Varieties—$1.00 per dozen, $8.00 per 100.

DAHLIAS.

A fine assortment of 25 Double Cactus, 12 Double Show and Fancy, 20 Pompone strong field grown roots. $1.00 per doz., $3.00 per 100.

MONTBRETIAS.

One of the most desirable of our summer and fall flowering bulbs, comparatively but little known, but certain to become popular. Six choice named sorts, 35c. per doz.; $2.50 per 100.

TIGRIDIAS.

4 Fine Sorts. 30c. per doz.; $2.00 per 100.

TUBEROSES.

True Dwarf Double Pearl, selected 4 to 6-inch bulbs. 85c. per 100; $7.50 per 1000.

JAPANESE LILIES.

DWARF PAPAYAS.

MOST magnificent Bedding and Decorative Plant over introduced; equal to a Palm in beauty; grows with the rapidity of the **Ricinus;** not affected by drouth. Plants from 4-inch pots, set out 1st June, attained a height of ten feet, and though not watered once, remained fresh and vigorous during the extreme drouth. Send for half-tone illustration showing bed of these plants. Every Florist should have it. Price to the trade $2.25 per doz. for 8-inch pots; all propagated from a tree which has produced this Fall and Winter 192 pounds of its delicious fruit, the largest weighing 12½ pounds.

TARO PLANT.—The genuine Sandwich Islands Taro, entirely distinct from the common Caladium, and a much grander plant in all respects. $1.00 each. Ready May 1st. **Send for Catalogue.**

LAKE GENEVA FLORAL CO.,
Lake Geneva, - - - Wis.

Please mention the Florists' Review when writing advertisers.

OMAHA, NEB.

Trade Conditions.

Business has been good the past two weeks. Stock is somewhat scarce, especially carnations. Roses are sold at 75 cents to $1.00 per dozen, carnations 35 to 40 cents, violets $1.00 to $1.50 per hundred. Bulbous stock sells well this year, as most of the florists handle it in small quantities.

Among the Growers.

J. F. Wilcox is sending in some fine American Beauties and Bridesmaids and some excellent Meteors are being received from McPherson & Reed. Mr. R. Unger consigns all his stock to St. Louis and gets a better price or just as good as the retailer realizes for his stock here in Omaha. The carnations and violets which C. H. Frey, of Lincoln, is sending to this market are unusually fine, as are also the Marie Louise violets which Nicols & Green are sending.

Notes.

Mr. Geo. A. Kuhl, of Pekin, Ill., called on us on his way to the coast and was very much surprised at flowers being sold at wholesale in retail stores.

The Nebraska Florists' Society are having lots of fun. They meet every Monday night to practice bowling. The scores made were as follows: A. Donaghue, Sr., 104; J. F. Wilcox, 143; L. B. Stewart, 126; Geo. Swoboda, 111; J. J. Hess, 128, which is a good average for starters. J. J. B.

CARNATION WELLESLEY.

In our last issue an omission was made from the advertisement of Tailby's new scarlet carnation on page 487. It should have read "For sale by J. Tailby & Son, Wellesley, Mass., and H. F. Littlefield, Worcester, Mass." It appears correctly in this issue.

Mr. J. Harrison, of Jersey City, N. J., besides having his star carnation, Mrs. J. Harrison, in good shape, has several very promising seedlings. One is a specially good pink that will undoubtedly be heard from in the near future. It has not yet been christened.

WHOLESALE CUT FLOWERS

And Florists' Supplies,

Long Distance Telephone
Express 466.

88 WABASH AVENUE,
CHICAGO, ILL.
Rooms 22 and 23

The American Carnation Society meets in Chicago Feb. 17th and 18th. We are glad of it, for, if there is anything new and we can get it, we want it for our trade. Some member of our firm will be there all the time and growers wishing to send stock to this market will find it to their advantage to see us before making arrangements. This also applies to the buyers, for although there is no doubt that the carnation plant growers will show fine blooms to catch the growers and sell his cuttings, so we also show every day the greatest supply of carnations of any firm in the West. The difference between us and the plant grower is that we sell the cut blooms of the best commercial varieties at prices that are right. You know what you can do with the blooms when you get them, but see if you can produce from the cuttings as fine blooms as those shown at the exhibition of the Carnation Society. We think not.

The daily supply from our many growers keeps us in shape to supply your wants and we want to supply them. Please do not forget that we have been more than fifteen years in the commission line, and, therefore, know what the trade wants. We can fill your orders for carnations, roses, bulb stock or anything else that grows. We are on top, and to stay there means to fill orders as we receive them with stock such as we know the trade wants.

At least consult us before you buy anything and before you sell, if you are a shipper.

The Novelty Tulip is still in the lead. 300,000 next year. Try it. It is just as represented.

WE WILL HANDLE THE ENTIRE OUTPUT OF THE KLEHM NURSERIES

70,000 NOVELTY TULIPS

THIS IS A SURE SELLER; ONCE YOU TRY IT YOU WILL NEVER BE WITHOUT IT

You can order them from any broker as we sell to them all.

Price, 5 Cents.

Jobbers in all kinds of desirable....

Florists' Supplies

PITTSBURG.

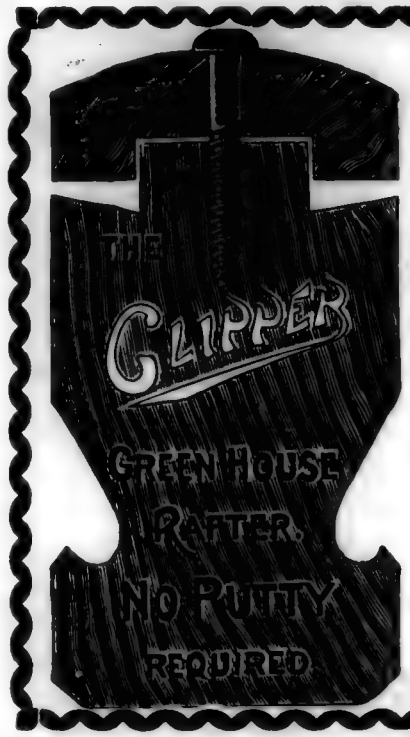
Trade Conditions.

Trade for the past week has been good. Bulbous stuff is plentiful and meets with fair demand. Judging from the sale of single violets, it would seem that they are becoming more popular here. Funeral work has been plentiful. Many memorial flower tokens were ordered for the unfortunate ones killed at the big fire of the Union Storage and Chautauqua Ice Co. plants.

Various Items.

The most noteworthy event of the week has been the formation of the firm of Britenstein & Co., which succeeds Patterson Bros. The firm is composed of Messrs. Walter Britenstein of Smithfield, and Walter Flemin, formerly manager of Patterson Bros. Britenstein & Co. will carry on the business in Patterson's old flower stand, corner Market street and Liberty avenue.

At a late visit to the greenhouses of F. Britenbaugh & Brother, at Bennett, Pa., your correspondent saw a very fine lot of fuchsias which are worthy of some note. The "Little Beauty" variety, which was originated by them, is again in big demand this season.



Visitors: Mr. D. Corbin, the violet specialist, of Philadelphia, and Mr. M. Rice, of M. Rice & Co., Philadelphia.

L.

FLORAL CALENDARS.

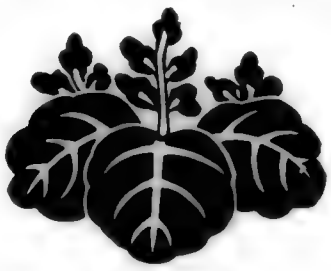
We have received from Mr. D. B. Long, Buffalo, N. Y., some completed specimens of his floral calendars for 1898, the designs for which have been already described in these columns. They are certainly very handsome. Another neat idea of Mr. Long's is a small blotter, upon the back of which appears the calendar for the current month. This bears the card of a retail florist who has evidently used these blotters for distribution to his customers. It ought to be a very effective advertisement, both blotter and calendar being useful and worthy of preservation.

HEADQUARTERS FOR
ASPARAGUS PLUMOSUS NANUS
W. H. ELLIOTT
BRIGHTON, MASS.
Cut Strings, 8 to 10 Feet Long, 50 cts. Each.
Shipped to any Part of the Country.

Butted Glass.

This is no longer an experiment, it has come to stay. There are various ways of making Butted Roofs, but the best way is with the

Clipper Bar.



With this bar you can make a roof that is absolutely free from drip, and glass cannot be torn out by the wind. Butted glass makes a tight roof, a warm house and saves fuel. It lasts longer, looks better and costs less than the old-fashioned roof. But do not think that this is the only bar we sell, for it is not; we furnish what people want and there is nothing in greenhouse material that you cannot get from us, and all of open-air-dried Cypress clear of bright sap, stained sap, knots and all other defects.

Lockland Lumber Co.

WARREN, O.

At the recent funerals of two very prominent citizens the floral offerings were very numerous and elaborate, many being sent here from other cities. One of the handsomest arrangements was a thirty-inch crescent wreath of Meteor roses and Roman hyacinths on a background of fancy ferns, and finished with Asparagus plumosus.

Trade is not as brisk as to be wished but I think there is some improvement.

The wholesale plant trade has not started much yet. Buyers are apt to hold orders back till the last moment. When ordered too late the plants are apt to lack time for recovery before planting out time.

The blizzard of two weeks ago did very little damage here. Only a few lights of glass were broken, though the wind had a velocity of 70 miles an hour.

Mr. A. T. Hoyt is now able to be about again. He expects to drop greenhouse work and devote his entire time to developing his hot water heating system. He has received many letters from prominent florists since the note appeared in The Review.

A gentleman asked me recently if I had seen any prosperity badges. Upon my answering in the negative he showed me a large patch on the seat of his trousers. Many of us have had these badges this winter. But we look forward to better things at an early date. MUM.

Among the floral tributes sent to the funeral of the mother of President McKinley was one arranged by Mr. Geo. W. Gaskill, of Warren, Ohio, which was a wreath of lilies and roses, and which was so much admired by the president's wife that she directed that it be sent to her apartments, and it was sent to Washington. This was certainly quite a compliment to Florist Gaskill.

New Forcing Rose.

Mrs. Robt. Garrett, Hybrid Tea.

Rich, soft pink buds, very long, flower extra large, delightfully fragrant, rivalling Bridesmaid in color, but larger and much more productive. A sturdy vigorous grower. A money maker and a triumph of American skill. The best firms in the country are investing in it. It has won numerous prizes and elicited the most favorable comment from critical judges.

Price, strong plants, from 2½ inch pots, $25.00 per 100. In lots less than 1000 $225.00 per 1000.

Orders booked now, delivery March 15th, 1898. Correspondence solicited.

HUNT'S REVIEW OF THE CHICAGO MARKET.

Thursday and Friday last saw large increase of stocks owing to softness of weather. In many cases keeping quality was affected and prices showed a tendency to drop somewhat. With Saturday's increased volume of business accumulated stocks worked off and Sunday found things back in the same old shape. There has been no change since except perhaps to intensify the situation.

Roses, carnations and, in fact, all stock are really first-class, but in exceedingly short supply. The greatest drawback is the tendency to cut before really fit for market.

Brides and Daybreaks have been the prominent short lines.

Weather is now clear and sunny for the first time in a long while and relief should, in a measure, be in sight. Immediate long lines are not probable, however, for some time yet to come.

The volume of business has increased greatly over corresponding period of last four years and indications point to a general healthy condition, not merely local, but widespread.

SOCIETY OF AMERICAN FLORISTS.

President W. F. Gude has appointed the following gentlemen to serve on the Executive Committee of the Society of American Florists: For two years, Mr. Edmund M. Wood, Natick, Mass.; for three years, Messrs. John H. Taylor, Bayside, N. Y., W. W. Coles, Kokomo, Ind., and E. H. Cushman, Euclid, O.

ROCHESTER, N. Y.

Market Resume.

Prospects for continued flourishing business are good, advance orders covering several weeks are in, consequently everybody is in good humor. Though for two days, while the storm lasted, but little trade was going on outside of party and funeral work, all flowers in the market were used up very clean. Shipments from out of town were cut short, shippers being afraid of the cold, perhaps, otherwise much more stuff might have been disposed of. Now, however, the supply has improved materially, but not beyond the ordinary every-day demand, and as to the meager supply of roses, we may well term it an everlasting source of annoyance all around, for no change for the better has yet set in. Tulips and other bulbous stuff are getting very plenty, but prices hold out good. An abundance of carnations come in daily, yet they sell at a very good figure and have not declined since last quotations. Both smilax and asparagus are getting scarce again in the last few days. Valley is none too plentiful, but miscellaneous stock is in fairly good supply.

An Accident.

Fred Schlegel, Jr., of F. Schlegel & Sons, has been on the sick list and was confined to the house for a week or ten days. He is now able to be around again, but Mrs. F. Schlegel, of the same firm, met with a very painful accident last week. While out sleighing one of the runners caught in the car tracks while the horse was going at a good speed, and, turning a corner, the sleigh was upset, throwing the occupants, two ladies, on the ice-covered pavement. Mrs. S. sustained a fracture of the collar bone, but in spite of demonstrations made by the few men who assisted in holding the horse and righting the sleigh, she was determined to drive home without the help of men. We are glad, however, to report that she is now improving, and hope that the plucky old lady may recover speedily her usual good health. K.

SIMMONS'

New Light Colored CARNATION

Mrs. S. A. Northway

We introduce this variety with even more confidence than we did Portia, Silver Spray, Tidal Wave, Daybreak, Rose Queen, or J. J. Harrison, knowing that it will become as great a cut flower variety as any of the above. Plant of strong, free growing habit, entirely free from disease or rust; large round high built flower with perfect calyx and extra strong and long stem. Color a beautiful soft shell pink becoming almost white when fully open.

Orders booked now and filled in rotation. We shall commence to ship soon after Jan'y 1st. Price, $10.00 per 100; $75.00 per 1000.

Geraniums. Md. Bruant, Md. Jaulen, Fleure Poitevine, J. Ricaud, and J. Sallier, 2¼-in. pot plants, $5.00 per 100. Rooted cuttings, $3.00 per 100; $25.00 per 1000. Our superb stock of all the finest sorts, 2¼-in. pot plants, named, $25.00; unnamed, $20.00 per 1000. Rooted cuttings, $12.50 per 1000.

Fuchsias. A grand lot of summered-over stock in small pots that will make early bloomers, $3.00 per 100.

All Rooted Cuttings Cash with Order.
Our Price List describes many other fine plants. Send for it.

W. P. SIMMONS & CO., - Geneva, Ohio.

Two Great Sports.

Carnation Victor.

Undoubtedly the best Pink Carnation in commerce and certainly the most prolific bloomer, perfectly healthy and of vigorous growth.

Rooted cuttings now ready, $4.00 per 100; $35.00 per 1000. Come and see this Carnation growing.

Chrysanthemum Pennsylvania.

The finest yellow for cut blooms or exhibition purposes ever produced. Plants ready March 15, $5.00 per doz.; $35.00 per 100; $250.00 per 1000.

HUGH GRAHAM

104 South 13th Street, Philadelphia.

AN UNPARALLELED SUBSCRIPTION OFFER.

EVERY one to whom this issue of the FLORISTS' REVIEW is addressed, and who fills out, signs and returns the accompanying subscription blank, accompanied by $1.00, within 30 days from date, will receive not only the FLORISTS' REVIEW for one year but also a certificate entitling him to the earnings on one-tenth of a share of stock in the company formed to publish the paper. The shares will be of a par value of $10.00 each.

Why do we make such an unparalleled offer? It is very simple.

You will have an interest in the success of the paper.

You will see that you can buy everything that you want to just as good advantage from advertisers in the FLORISTS' REVIEW as elsewhere and at the same time benefit yourself by increasing the earning power of your certificate.

This mutual arrangement cannot fail to bring to the paper a heavy advertising patronage, and as a result the stock represented by your certificate will earn good dividends.

And the more you buy of advertisers in the FLORISTS' REVIEW (always mentioning the paper) the larger your dividends will be.

You will get a better paper than has yet been published in this field, and a share of its earnings. Please let us hear from you by early mail.

FLORISTS' PUBLISHING COMPANY,

530-535 Caxton Building, - - - CHICAGO, ILL.

RICHMOND, VA.

With the thermometer registering 10 degrees above zero, I stepped into the store of W. A. Hammond and found that gentleman busily engaged upon a pretty wreath of Scott carnations and mignonette. The carnations were stemmed with their foliage and were very pleasing. This was considered almost too fine for a drummer. He deserves immortelles.

On my way to the estate of the late Major Ginter, I looked in at the houses of Mr. Hammond, who is noted for his Beauties (maids as well as roses). This year he has not grown so many as usual and regrets the fact, as the demand has been very good. One house in which Beauty was carried through the summer is planted with sweet peas, which will be in flower about three weeks later. While the double violet has not done so well as usual, this being the first season Lady Campbell has gone back on Mr. Hammond, the single varieties have been even better than former seasons and in excellent demand; total sales much in advance of former years. Two houses, each 22x 200 feet, were recently added for roses and carnations.

Speaking of carnations reminds me that I saw at Mrs. Rehder's, Wilmington, a bunch of Alaska looking as bright as if freshly cut, and was informed they were received from the Quaker City six days before, a proof of its great keeping qualities.

Entering the Ginter place upon the wing of a regular norther I found Mr. Henry Hughes, the capable superintendent, gathering some luscious tomatoes, and as this vegetable is being grown for profit by many of the craft, I took some notes of what are considered the best kind for forcing. They are: Best of All, Eclipse, Lorillard—in the order named. Cucumbers are raised extensively, the varieties being Telegraph and Rochford's Covent Garden. The mushroom is forced in a house near the boilers, which are Hitchings, which firm last year built the handsome range composing vinery, rose house and octagon shaped palm house. This addition, with the glass already on the place, covers a considerable area. Much of the product is supplied to the palatial Hotel Jefferson. The garden surrounding this beautiful place reminds one of "Bibber's" description of that charming spot upon which he first gazed and upon whose memory its impressions are so indelibly fixed. W. M.

ESTABLISHED 1866 **EMIL STEFFENS** SUCC. TO N. STEFFENS. AND STEFFENS BROS.

MANUFACTURER OF

FLORISTS WIRE DESIGNS & SUPPLIES

335 EAST 21ST ST. NEW YORK CITY.

CHARLESTON, S. C.

This city is one of the keys to the so-called sea islands, where a vast quantity of truck is raised chiefly for the New York market. The quantity of seed sown is enormous. In conversation with Mr. McIntosh, a member of the firm of W. McIntosh & Sons, I was informed that his firm alone has this season handled one thousand bushels of peas, in addition to vast quantities of beans, etc., one cotton planter planting 180 bushels. The peas are sown after the crop of cotton is taken off, the cotton stalks acting as support for the haulm. After the pea crop is gathered the whole is ploughed under for manure. The varieties First and Best, Extra Early and Alaska are most popular. The usual time for a crop is sixty days.

Owing to the mildness of the climate the florist cannot depend alone upon the legitimate, so is either a jobber, seedsman or undertaker, all of which harmonize. W. M.

CATALOGUES RECEIVED.

THE COTTAGE GARDENS SET OF

ALL ARE FULLY DESCRIBED IN OUR JANUARY, 1898 PRICE LIST.....,

NEW CARNATIONS

NEW YORK
(Ward), a bright cerise-pink.

WHITE CLOUD
(Dorner), a free-blooming, long stemmed white.

BON-TON
(Blake), a bright scarlet, fine stiff stems.

JOHN YOUNG
(Ward), fine fringed white, Scott habit.

MRS. JAMES DEAN
(Ward), a pure clear pink.

GOLD NUGGET
(Dorner), a fine deep yellow, early and free.

....WHAT THE DEALERS SAY....

NEW YORK, 1898.

MR. C. W. WARD, Dear Sir:—Your carnations are a grand lot. You should grow more of them. I have no hesitancy in saying that I can sell all of these varieties that you can grow. New York and Mrs. James Dean are the finest pink carnations I have ever handled. White Cloud and John Young are two grand whites and have proved fine keepers. Gold Nugget beats all the other yellows. Mrs. Geo. M. Bradt is the best variegated carnation that comes on the market to-day. Bon-Ton is a grand scarlet and Maceo is the best dark carnation that I have ever seen. All are good keepers and are satisfactory to my customers, and have sold regularly at from $3 to $8 per 100. I am free to say that you have the finest collection on the market this season.

Very truly, JNO. YOUNG.

CITY HALL CUT FLOWER MARKET, 15 Province St.
WELCH BROS., Proprietors.

THE COTTAGE GARDENS, ..C. W. WARD.. MANAGER. QUEENS, N. Y.

GRAND RAPIDS, MICH.

Banquet.

The third annual banquet of the Grand Rapids Florists' Club was held at the Eagle Hotel Feb. 1 and was the most successful yet held. In spite of the fact of its being zero weather, there was a full board, and considering the happy "guess I've had enough" expression, worn by all, the affair was indeed a gastronomic success, of which Deacon Johnson might well feel proud. Our worthy president, N. B. Stover, passed round the dessert in the shape of a brief history of the club since its organization on March 19, 1895. The program consisted of recitations, songs and piano solos, and was carried out without a hitch, reflecting great credit on the committee of arrangements, William Cunningham, J. A. Creelman and Eli Cross. The next meeting will be held Tuesday afternoon, Feb. 15, at Alfred Hannah's, on East street, near Burton avenue. The florists will go early so as to inspect the greenhouses before meeting.

PEKIN, ILL.

At a recent wedding in one of the handsome residences of our city the floral decorations were much more elaborate than usual. Smilax was used in abundance, and the roses, Brides and Maids of the celebrated exhibition stock, lately grown under the supervision of Mr. J. A. Nelson, manager of Geo. A. Kuhl's plant, were by long odds the finest ever seen by the guests from home or abroad. P.

ECONOMIZE IN FUEL BY USING S. TAPLIN'S

Double Action Clay and Slack Burning Hot Water Boiler.....

Merits I Claim for it over any other Boiler

FIRST. It can be worked with the cheapest kind of fuel. In this case, the fuel consists of clay and hard coal screenings in about equal parts. Such fuel cannot be used in any other boiler to advantage, for the reason that it takes too long before the required heat is given off. This objection is met in my double furnace boiler by arranging the fires alternately, and while one fire is burning up, the other is giving off the required heat.

SECOND. The economy in time required in attending fires. One fire started the first day with part of a charge which is allowed to take fire when the furnace is filled up, requires scarcely any further attention until cleaned out on the third day. Second fire, started on the second day, runs till fourth day, giving each fire forty-eight hours.

THIRD. As one fire is taking care of the boiler, the other is allowed to burn out clean; no partly-burned fuel being wasted, as is so often the case in other boilers.

FOURTH. When fires have burned out, nothing is left in furnace but light, brittle clinkers and dust—the latter making a splendid material for propagating in place of sand; also for mixing with soil for potting, and benches for roses, etc., as nearly all plants like it. The clinkers are much better than gravel or broken brick for making walks; also for concrete for under-ground walls or foundations.

FIFTH. There is no smoke, consequently no soot. The boiler is set in brick-work, with soot doors so arranged that every part can be reached and any dust that settles wiped out in a few minutes, as well when fires are burning as when out, thus avoiding loss of heat by letting fires out to clean flues.

SIXTH. The boiler consists of four-inch water spaces all of which are exposed to direct heat both below and above. No tubes are used, so there is no trouble with replacing tubes every few years, as is necessary in any hot-water boiler that is out of use four or five months in the year.

SEVENTH. Simplicity of construction. It can be easily cast or made of wrought iron or steel, welded or riveted.

EIGHTH.—The same principle can be adapted to special advantage in the construction of steam boilers, where waste or any kind of cheap fuel, such as coal screenings, sawdust, spent tan bark, pressed hay or peat bog, is used. With all such fuel, the fire requires frequent feeding, and every time fuel is thrown in, the fire is deadened by the amount of cold air admitted. Every practical engineer knows the loss of power caused by constantly opening the furnace door.

NINTH. The great power of the boiler. One having over five thousand feet of four-inch pipe, which was in use through the last severe winter, did the work formerly done by three number seventeen and one number fifteen Hitching's boilers, and the cheap fuel used cost less than the hard coal to run one Hitching's number seventeen would have cost for the same time.

TENTH. Where a little warmth is required, as is so often the case for roses, till quite late into summer and very early in the fall, a fire can be started about every three days, and with draft shut off it will keep a steady warmth in the pipes at a cost of fuel and attendance which must be seen to be believed. With other boilers, time and fuel are such important items, that fires are dropped as early as possible and started again in the fall often after mildew has got in its destructive work.

I expect it will be extensively used in Europe, where economy is almost a science.

MILWAUKEE.

Business Conditions.

Business has been of a steady nature for some time past and supply of stock with exception of extra choice roses is about equal to the demand.

Prices on roses remain about the same with quality somewhat improving. Poor to medium grade run from $2 to $5, and first quality to select, $6 to $8 per hundred; some extra choice go at even better figures. Carnations from bad to good bring from $1 to $3 per hundred. Some fine Valley is coming in and brings from $3 to $4. Violets are quite plentiful and 50 cents per hundred is about average top notch price for good quality.

Notes.

C. B. Whitnall has been nominated for city treasurer on the Social Democracy ticket, but later reports are that he declined to accept the nomination.

Miss Maggie Edlefsen, who has been sojourning in the East, is expected to return soon.

Nic Zweifel, who has been confined to his home for some months on account of sickness, has again made his appearance downtown.

Ellis & Pollworth have enlarged their quarters by cutting out the partition and taking in the neighboring basement, also putting in an elevator and adding a flower seed department to their plant.

GEO. WASHINGTON.

NEW BEDFORD, MASS.

One of the popular blizzards of the West has been extending its arms into forbidden territory of late and more damage has been done than on any previous occasion in past years. All communication with distant cities was cut off and many greenhouses were more or less damaged by the storm.

At the present time of writing we have a labor blizzard on our heads, which is much more disastrous to the trade than the cold blizzard of the West, throwing thousands out of employment. Business is practically stopped and the streets filled with idle men. It is not a very bright prospect for Easter trade. C.

THOS. W. WEATHERED'S SON

Horticultural Architect and Builder

Get my Prices on Everything Needful for Erecting or Repairing Greenhouses.

AND send four cents in stamps for my latest catalogue, circulars, etc., showing the best and most economical

BOILERS for heating, from the smallest self-feeding for small conservatories, stores, etc., to the largest sectional for large commercial establishments or public parks.

CYPRESS greenhouse material, free from sap, of all sizes, shapes, etc., as desired, from the smallest sash-bar to the largest sill-plate. Clipper sash-bars as well kept in stock ready for shipment.

DOORS of the best clear cypress, made especially for greenhouse purposes, always in stock.

EAVE-PLATES of Cypress, the very best; all shapes as well as Sills, Ventilating Sash, Ridge, Ridge Cap, Gutters, Purlins, Headers, etc.

FITTINGS of every kind, from the smallest for pipe purlins to the largest for a heavy four-inch greenhouse pipe. Also Valves, Expansion Tanks, etc., always ready for shipment.

GUTTERS of cast iron or of clear Cypress, for outside "ridge and furrow" houses, or any and all kinds. Glazing points of all kinds from the patent to the zinc nails.

HEATING—After forty years' experience, devoting it all to the heating of greenhouses, from a small conservatory to the largest, such as the Schenley Park greenhouses at Pittsburgh, Pa.; Central Park, New York City; Druid Hill, Baltimore, Md.; Prospect Park, Brooklyn, N. Y.; as well as supplying complete heating plants in England and Japan, think you can have sufficient confidence to expend two cents in a stamp and time writing me your wants in that line.

CARNATIONS

Lancaster, Pa., Feb. 11, 1898.

The American Jadoo Co.,
817 Fairmount Ave., Philadelphia, Pa.

Gentlemen:

I have experimented with JADOO FIBRE in a small way for propagating Carnations and find that they root with ordinary care one hundred per cent.

Next season I shall use it almost exclusively for propagating my carnations.

Respectfully yours,
(Signed) ALBERT M. HERR.

NO COAL BILLS.

A greenhouse has been built in the Yellowstone Park, near a geyser which furnishes hot water for heating, and according to a report in the daily press most remarkable results are attained, including such trifles as "cucumbers ten feet long," etc. What a blessing it would be if every florist could have a geyser at hand. He might have to send his American Beauties to market on a lumber rack, or there might be more money in selling the stems to be used for telegraph poles.

If you grow good stock for the Chicago market you can get the best returns by consigning to Vaughan, McKellar & Winterson.

Burpee's Seeds Grow

AN UNPARALLELED SUBSCRIPTION OFFER.

EVERY one to whom this issue of the FLORISTS' REVIEW is addressed, and who fills out, signs and returns the accompanying subscription blank, accompanied by $1.00, within 30 days from date, will receive not only the FLORISTS' REVIEW for one year but also a certificate entitling him to the earnings on one-tenth of a share of stock in the company formed to publish the paper. The shares will be of a par value of $10.00 each.

Why do we make such an unparalleled offer? It is very simple.

You will have an interest in the success of the paper.

You will see that you can buy everything that you want to just as good advantage from advertisers in the FLORISTS' REVIEW as elsewhere and at the same time benefit yourself by increasing the earning power of your certificate.

This mutual arrangement cannot fail to bring to the paper a heavy advertising patronage, and as a result the stock represented by your certificate will earn good dividends.

And the more you buy of advertisers in the FLORISTS' REVIEW (always mentioning the paper) the larger your dividends will be.

You will get a better paper than has yet been published in this field, and a share of its earnings. Please let us hear from you by early mail.

FLORISTS' PUBLISHING COMPANY,

530-535 Caxton Building, - - - CHICAGO, ILL.

Following is the form of certificate we issue to subscribers:

$1.00 $1.00

The Florists' Publishing Company, Chicago.

This Certifies that _____ of _____

_____, is entitled to the annual dividends on one-tenth of a share (par value of each share $10.00) of the stock of the FLORISTS' PUBLISHING COMPANY, of Chicago, Ill., that has been placed in my custody as Trustee, so long only as

_____ shall remain a paying subscriber to the FLORISTS' REVIEW.

This certificate is transferable only to _____ successor in business, and then only on application to the undersigned. Dividends will be made of net profits on the first day of January of each year.

Certificate holders are reminded that by confining their purchases to those who advertise in the FLORISTS' REVIEW (always mentioning the paper when writing) they will greatly enhance the earning power of their certificates.

Buy to best advantage always, but, everything else being equal, give the preference to those who advertise in the paper in which you have an interest.

Witness my hand and seal at Chicago, Ill., this _____ day of _____, 1897.

(SEAL) _____,

Trustee.

We Have to Offer at this Time a Large Stock of
Strong Dormant Fieldgrown

CANNAS.

Which we offer at very low prices. The varieties are the very best and finest grown to-day. Florists will find this the most advantageous time to procure stocks and start them for spring sales.

We offer the following sorts at only **$3.00 per hundred,** viz:—

Paul Marquant **Alphonse Bouvier** **Chas. Henderson**
Mme. Crozy

The following sorts at only **$4.00 per hundred,** viz:—

Florence Vaughan **J. D. Cabos** **Austria**
Egandale **Pres. Carnot** **Queen Charlotte**
Admiral Avellan **F. R. Pierson** **J. C. Vaughan**

The following extra choice sorts at **$6.00 per hundred,** viz:—

Eldorado **Chicago** **Pierson's Premier**
Souv. de Antoine Crozy

The following newer and scarcer sorts at **$10.00 per hundred.**

Souv. de Pres. Carnot **Burbank** **Beaute de Poitevine**
Italia **Papa** **Franz Buchner**

We also can supply the following:—

Tuberose Pearl, extra quality.....$1.00 per 100; $7.00 per 1000
Caladium Esculentum
Bulbs 6-9 in. in circumference.....$3.00 per 100
Bulbs 9-12 in. in circumference..... 6.00 per 100

THE WEEKLY
FLORISTS' REVIEW

FLORISTS' PUBLISHING CO., 520-535 Caxton Building, CHICAGO.

Vol. 1. CHICAGO AND NEW YORK, FEBRUARY 24, 1898. No. 13.

THE CHICAGO CONVENTION.

It certainly was a very successful and satisfactory meeting. The sessions were well attended and the interest well maintained. The exhibition was simply superb, and the flowers shown told the progress of the year better than any essay or review. Mr. Scott's statement that it was the grandest exhibition of carnations the world has ever seen was undoubtedly correct. But that the show at Philadelphia a year hence will be even grander, none that has seen the rapid progress of the last few years can doubt. The gigantic strides made in the culture of the "Divine flower" are truly marvellous.

Philadelphia was selected by a unanimous vote as the place for the next convention.

Officers elect are: President, Wm. Nicholson, Framingham, Mass.; vice-president, Wm. P. Craig, Philadelphia; secretary, Albert M. Herr, Lancaster, Pa.; treasurer, Fred Dorner, Jr., Lafayette, Ind.

Changes in the constitution and by-laws were made providing for the calling of special meetings by the president and permitting voting by authorized proxy at such meetings. Also for the selection of judges by a new method. This is an addition to Art. VII., and reads as follows:

"At the first session of the society at which there is an exhibition, the president shall, after consultation with the executive committee, nominate nine members known to be present for judges. The meeting thereupon shall either accept or reject the nominations or call for the nominations of additional names. When nominations shall have been made by the president and accepted by the meeting, nominations shall be closed and the meeting shall proceed to vote for six judges by ballot. The three nominees receiving the highest number of votes shall be the judges to pass on all exhibits at the exhibition of the meeting at which they are elected, and shall award all certificates and premiums. All protests against the decision of the judges shall be filed in writing with the executive committee promptly. In case of protest by a member of this society or an exhibitor, the executive committee shall examine into the matter carefully and if they consider an error has been made shall report to the society with suggestions as to its correction, otherwise they shall confirm the action of

the judges. In all cases of protest no premium shall be paid or certificate delivered until the judges' action is confirmed by the executive committee or the protest has been settled by the society as the case may be."

Changes in the by-laws more clearly define the duties of the secretary and require that he shall give a bond.

The proposed section providing for the expulsion of members detected in dishonest practices at the exhibitions did not carry, the members fearing it might be difficult to exactly determine what would properly come under that head.

President Rudd in his address took an exceedingly hopeful view of the future of the society and of the carnation. He felt that certain desertions from the ranks were a source of strength to the society, as with the deserters had gone intrigue and dissension. Referring to the business depression of the last four years, he expressed the belief that bottom was touched last year and that we are now on the upward grade. He felt that carnations summer grown in the field cannot compete in quality with those grown throughout the season under glass, and that we may look to see the same change take place in our methods of culture as the chrysanthemum grower has had forced upon him.

The treasurer's report showed total receipts during the year of $598.93, and expenditures of $492.61, leaving a balance of $106.32 in the treasury.

In regard to obtaining reduced rates from the railroads, Secretary Herr reported that an effort had been made, but that a considerable initial expenditure would be necessary to pay the expenses of the railroad agent attending the meeting as the representative of the railways and that even then the rate would not be good unless fully 100 purchased tickets on the certificate plan.

A letter from Mr. W. R. Shelmire, Avondale, Pa., recommended some very radical changes in the work of the society, especially as regards the awarding of certificates, but no action was taken at this meeting.

It was presented to the society that the variety Harrison's White and Puritan were one and the same. In the discussion it appeared that Mr. White honestly believed he was disseminating a white sport from Wm. Scott, and that he was led into the error through receiving a lot of plants of Scott in which a plant of Puritan had accidentally been mixed.

Prof. Arthur's essay, printed in this issue, called out a very interesting discussion, in which he ably met several objections urged against his proposed plan of sub-watering. A point in favor of the plan, noted by Mr. Adam Graham, was that there would be much less waste of fertilizers than with surface watering, which resulted in the leaching away of much of the good in the soil without benefit to the plants.

Secretary Herr's suggestion regarding a permanent fund, the interest of the same to be used for advancing the work of the society, and thus do away with the necessity of soliciting the cash for the prizes at the exhibitions, brought out quite a discussion. A fund of sufficient size was deemed out of the question at present, and effort was then directed toward securing a regular annual contribution of $25 from a sufficient number to carry on the work of the society on a larger scale. The following offered to so contribute: Albert M. Herr, W. N. Rudd, E. G. Hill, Wm. Nicholson, Fred Dorner, H. Weber, W. J. Vesey, R. Witterstaetter, W. P. Craig, Wm. Scott, Lockland Lumber Co., W. J. Palmer, C. W. Ward, Adam Graham. The executive committee was instructed to see members not present at the meeting and secure additional names. Later it was decided that any excess over $500 a year in the receipts of the society should be applied to form a sinking fund. It is hoped to in this way give the society some financial back bone.

Mr. Dorner's paper on the introduction of new varieties appears in full in this issue.

An inquiry as to whether any carnation was "rust proof" brought out the general opinion that no variety can be considered absolutely proof against rust.

A committee was appointed to ascertain fully about the Michigan law regarding shipments of plants to that state.

Having the convention, exhibition and hotel accommodations all under one roof was an excellent feature which was much appreciated by the visitors. The banquet was given in the exhibition hall Friday evening after the exhibition had been cleared away, so it was not necessary for those attending to leave the hospitable roof of the great Auditorium Hotel, except to visit the local florists and see the city.

Friday afternoon and Saturday morning parties of the visitors made trips to the establishment of Bassett & Washburn, at Hinsdale, and to Mt. Greenwood to see the plants from which Mr. Rudd cut those splendid blooms of Jubilee, Pingree and McBurney.

Crabb & Hunter, of Grand Rapids, Mich., expected to enter their pink seedling Irene for a certificate, but a few days before the convention some vandals entered the carnation house and carried off nearly all the flowers available and they were unable to make up the required number of good blooms. From the snap in Mr. Crabb's eyes when telling of this aggravating misfortune we judge it would have fared ill with those boys had he caught them.

Harry Balsley's check suit was the admiration of all beholders.

South End of the Hall. Glimpses of the Exhibition of the American Carnation Society.

Some of the adjourned sessions had great substance and lasting qualities.

Professor Wm. Scott does not recognize Puritan as a white sport from his namesake. Says if he sports it must be something good.

The professor is no sport himself, but wasn't he a dream of loveliness in that dress suit at the banquet!

Mr. Geo. A. Rackham, of Detroit, had prepared to make a display at the convention and shipped his flowers, but they failed to arrive. At last accounts the package was still in the hands of the express company.

On Thursday evening bowling teams representing Cleveland, Cincinnati and Chicago, played two games on the Kinsley regulation alleys. The individual scores had better not be mentioned, as many were almost microscopic. The totals were Cleveland 1294, Cincinnati 1455, Chicago 1525. While the scores were not large all participating seemed to enjoy themselves hugely.

THE EXHIBITION.

The morning of the 17th was bright and fair with the thermometer high enough to make us all feel very comfortable. The beautiful banquet hall of the Auditorium is an ideal place for an exhibition of Flora's choicest products, but the fine stained glass windows but time and circumstances forbid "All's well that ends well," and as we heard not a word of criticism about the awards or certificates we must surmise that the hard-worked judges fulfilled their duties to the satisfaction of all. The display was certainly grand and do you realize that the carnation convention just closed brought out the most wonderful, the finest and greatest show of carnations the world has ever

It is worthy of mention that although the hall during Thursday morning was extremely close and warm, and grave fears were expressed that it would be a sorry sight on the morrow, yet with a proper attention to ventilation and a cooling off of the steam, the flowers w.th scarcely an exception showed up fully equal to the first day, and as many of them did duty at Friday night's banquet they

Prize-Winning Vases of Mayor Pingree and Jubilee.

Vase of Empress and General Display. Glimpses of the Carnation Exhibition.

afford a poor medium for admitting the light of day, so electric lights made all brilliant. The different scarlets and reds wore a slightly different shade under this artificial light, but that only enhanced their beauty. The arrangement of the tables and exhibits left nothing to be desired from an artistic point of view, but for fair and correct judging it was by no means a satisfactory arrangement. After the awards, the arrangement could be altered for general effect. The management intended it should be different, seen? If any one should doubt such an assertion let him ask himself the question "Where was it possible there could be anything like it?" certainly not in Europe and assuredly not here in this North America, for the gorgeous varieties did not exist to reflect their beauty into beauty's eyes. The description of the various exhibits that follows was gleaned during a steady march round the hall and we trust nothing escaped our notice. The premiums and awards of certificates will appear elsewhere.

bore out the reputation that properly belongs to the carnation; namely, a durable and lasting flower, unless used in a hall or room that is densely packed with human beings. The hall was at no time crowded and being very lofty the flowers escaped the withering blast that has been often noticeable on similar occasions.

Ward Cup; 24 blooms, 6 half open flowers and 6 buds showing color:—F. Dorner & Sons showed Gold Nugget, a grand flower and likely to be the commercial yellow of the future. George Hancock & Son, Grand Haven, Mich., entered Gold Coin, a medium yellow of self-color; few markings.

Three-Year-Old Seedlings:—Stollery Bros'. (Chicago) Argyle made a fine appearance; large flower and excellent stem. Wm. Swayne's (Kennet Square, Pa,) Empress is an enormous affair; flower of largest size and longest stem in the exhibition, averaging 3 feet. Frank Niquet, Patchogue, N. Y., has a beautiful flower in Maud Adams; a deep pink of fine form. W. J. & M. S. Vesey staged their good red Fort Wayne, R. Witterstaetter, Sedamsville, O., staged Evelina. It is a beautiful white, as near perfect as we have yet seen a carnation and looked as fresh and unrumpled as growing on the plant. If it develops no serious fault as a grower it must become a universal favorite.

Vase of 100 Blooms:—This class brought out the richest display. The size and mass of blooms were stunning. E. G. Hill & Co. exhibited Jubilee and

Flora Hill. John Burton, Chestnut Hill, Philadelphia, showed Alba Superba, a white with grand stems and medium sized flowers. W. P. Craig, Philadelphia, showed a vase each of Flora Hill and Lily Dean, both in excellent order after their long journey. W. N. Rudd, Mt. Greenwood, Ill., made four fine exhibits in this class. They were Jubilee, Flora Hill, Mayor Pingree and Mrs. McBurney. All four of them were of extraordinary excellence of these well known varieties, but Mrs. McBurney is not so well known. It ranks with the largest in size and stem and is of a smooth, uniform soft, light pink; but pink does not describe it, fawn would be nearer. It will be heard ed 50 Daybreak. Wm. Murphy, Cincinnati, staged a vase of good-sized Portia, which we all have known so long that it seems to belong to that class we grew "befo' de waa." W. N. Rudd's exhibit in this class was a fine lot of Jubilee. F. Dorner & Sons Co., with C. W. Ward, of Queens, N. Y., exhibited jointly a fine lot. They were Dazzle, a bright, useful scarlet; White Cloud; New York, a beutiful cerise pink; John Young, a fine white; Mrs. James Dean and Uncle John. The latter was really fine; if we could grow Uncle as it was shown, there would be less demand for the new ones. W. P. Craig exhibited a vase of Jubilee. R. Witterstaetter's exhibit consisted of

Table of the South Park Floral Co. Glimpses of the Carnation Exhibition.

of more frequently in the future. F. Dorner & Son, Lafayette, Ind., had three vases of superb flowers, Gold Nugget, White Cloud and the beautiful solid, substantial, but awkwardly named Mrs. Bradt; everybody must grow Mrs. Bradt. J. Breitmeyer & Sons, Detroit, Mich, had three vases; one Mayor Pingree, one an unnamed crimson and 100 blooms of a dark pink, all flowers of great excellence. H. Weber & Sons, Oakland, Md., staged vases of McBurney, Triumph and Mrs. Bradt. There were no excuses for their long ride. They were grand flowers in fine order. Wietor Bros., Chicago, staged a fine vase of Armazindy.

Vase of Fifty Blooms:—In this class competition was keen and brought out a fine display. The South Park Floral Co.'s (New Castle, Ind.) exhibit consisted of Armazindy, Jubilee, Albertini, Lizzie McGowan, and Alaska. The older varieties as well as new were in fine form. E. G. Hill's exhibit included Flora Hill and Armazindy; needless to say Flora was at her best. A. Sunderbruch's Sons Co., Cincinnati, O., showmagnificent flowers of Evelina. H. Weber & Son exhibited Storm King (a fine white), Eldorado, Hector (a grand scarlet; if you can grow it), Jubilee, Scott, Buttercup and Daybreak. H. N. Higinbotham exhibited a vase of fine old Tidal Wave.

Twenty-five Blooms; Varieties Sent Out in 1897:—F. Dorner & Sons Co. showed in this class Mrs. C. H. Duhme and Mrs. Bradt. It was noticeable in this exhibit that Mrs. Bradt held up its wonderful flowers erect; as erect as the dignity of the worthy man who raised it. Queen of the West, a light pink of the Emma Wocher shade, was shown by Sunderbruch's Sons. Mrs. Bradt and Ruby (a red) by Wm. Murphy. Flora Hill by H. Weber & Sons, and by W. N. Rudd, Flora Hill and Mrs. McBurney.

For Special Premiums:—W. N. Rudd exhibited a grand 100 blooms of Flora Hill. For the Breitmeyer prize of 50 Pingree Mr. Rudd was also to the front with splendid flowers. The same grower also showed the best 12 Pingree.

Preliminary Certificates: — Entered for these were far more than last year at Cincinnati. J. Tailby & Son, Wellesley, Mass., brought their seedling Wellesley, a bright scarlet with good stems, but the flower had suffered from its long ride on a sleeping car. In fact you may say it had made a proper use of the car. Peter Fisher, of Ellis, Mass., showed a vase of Mrs. Thomas Lawson. This is a magnificent rosy pink flower of largest size with fine stem. It was one of the very best flowers in the exhibition and looked as if it had just been picked next door. E. G. Hill's exhibit in this class was no less than 4 varieties, all scoring high. America is a light scarlet, fine flower. Scarlet Queen is also a fine bright scarlet. Arbutus is a beautiful flower of the Daybreak shade, and Prima Donna is a silvery pink. As the schedule did not call for an exhibit of plants 75 points out of a possible 90 gained a certificate. F. Dorner & Son exhibited a vase of G. H. Crane, but whether it was for a two or three years' certificate, I am not sure. It will not, however, be sent out this year. It took the eye of every one. It is a large scarlet of finest form and color, good stem, and has all the attributes of a high class standard scarlet carnation.

There were a number of seedlings, several of great promise, exhibited under name and number as the following list will show: Barnd Sisters, Findlay, O.; Olive Snyder (crimson); R. Witterstaetter, Opal, Daybreak shade, but deeper in center, also unnamed seedlings. There were three sports of Tidal Wave shown, all varying in some degree from the type; one by John T. Tonner, of Galewood, Ill., one by J. Murchie, Sharon, Pa., and another named Evanston grown by M. Wieland, Evanston, Ill. F. Dorner & Sons Co. showed a very full deep pink of great fragrance, labeled No. 82 and 44, a pure white finely fringed. H. Weber & Son had half a dozen seedlings; some very pretty shades. E. G. Hill showed two unnamed; one a very fine dark red. C. W. Ward exhibited Blush, white with blush center, also Brower, a seedling of Daybreak; a fine pure white flower.

There were several fine exhibits of carnations not entered for competition. D. B. Long, of Buffalo, staged 3 vases of Genesee, raised by Harmon & Burr, of Darien, N. Y. While this cannot be called a large flower, when shown by the side of Flora Hill, it is of such purity and substance and excellent stem, that it showed up fine, and it was noticeable that on the second day it was better than on the first. C. F. Baker, of Utica, N. Y., showed his two seedlings Red Jacket and Oneida, the former a fine red, the latter a pure pink of good size. They scarcely showed up in their best form, not having been well packed. Hall & Sons, Clyde, O., showed Sandusky, a fine striped variety. H. Neimeyer, Erie, Pa., exhibited Snow Queen, of medium size, also a light unnamed scarlet. Hugh Graham, of Philadelphia, staged a vase of Victor which was scarcely

AWARDS ON SEEDLINGS.

The seedlings were judged by the scale of points indicated below. In the first year seedlings entered for preliminary certificates a plant is not required to be shown and therefore only 75 points are required to win a certificate. In the three year seedling class those scoring 85 points or over are entitled to a certificate.

ENTERED FOR PRELIMINARY CERTIFICATES.

*Plant not shown.

as fine as the grand vase shown last year at Cincinnati; the journey had told on it. R. Witterstaetter showed a vase of Evelina which were cut January 31 and February 1, and were still in most excellent condition. Mr. C. W. Ward's fine vase of Bon Ton attracted much attention. It is not of extra size, but every flower as perfect as a pompon dahlia, of a bright scarlet, fine stem and well named, for it is an aristocratic finished flower and will be widely grown. Mr. W. had also a vase of Glacier, a pure white. There is something in the art of packing, for all of Mr. Ward's exhibits were as perfect and fresh as if just emerging from his cellar. His vase of 50 White Cloud were perfect. Somewhere we saw a vase of J. Breitmeyer & Son's Cerise Queen. Its name implies its color, it is a large, fine flower.

Besides the carnations there were several displays which added much to the general effect, and for which the committee in charge were doubtless very grateful. Messrs. Bassett & Washburn, Hinsdale, Ill., filled a tab e with a beautiful show of roses and carnations. There were extra fine (the word is not strong enough) vases of Bride, Bridesmaid and Meteor roses, Jubilee, Pingree, Mrs. Bradt and Mary Wood carnations. Mary Wood is a beautiful flower, pure white with a blush center. George A. Kuhl, Pekin, Ill., made an exhibit of Belle Siebrecht rose, great color, size and substance; also vases of Bride and Bridesmaid which were far above the ordinary, and vases of Jubilee and old Tidal Wave looking unusually beautiful in form and color.

W. W. Coles, Kokomo, Ind., brought along a fine bunch of Kaiserin Augusta roses and an 8-foot American Beauty which he used to keep the flies off the flesh colored carnations. George & Allen, Cincinnati, made an exhibit of miniature hyacinths, tulips, Meteor roses and lily of the valley. J. A. Peterson, Cincinnati, showed a bunch of Princess of Wales violets of great size and stems eleven inches long. South Park Floral Co. exhibited 2 vases of magnificent Brides and Bridesmaids roses. Swan Peterson, Gibson City, Ill., made an exhibit of Marie Louise violets. They were fine in size and color. John H. Sievers, San Francisco, sent a number of seedlings, 18 varieties, all in good order, many of them of great size and substance. Among them was one named Hanna Hobart (seedling of three years). This was the largest individual carnation in the hall.

Last, but oh my, not least, was a large vase of the new rose Mrs. Robert Garrett grown and exhibited by H. Weber & Sons, Oakland, Md. It would take a rose enthusiast to properly and adequately describe this queen of a queenly race. It has a grand stem, is of great size, beautiful leaves, and could be called a silvery pink of the Carnot shade, but much deeper in color. The writer has never seen it growing, but as exhibited it is all things considered the most beautiful rose we ever saw, and if Mr. Weber gets any advertising out of the free show he deserves it, for it was a charming sight.

In nooks and corners, and here and there a group, were scattered some nice palms which made the beautiful hall look cosy and thus endeth the 7th annual display of the Carnation Society. Perhaps better are to come, if so they will be wonderful, indeed. It is good that the evolution of Dianthus Caryophyllus is gradual like all true evolution. If Jubilee, Flora Hill, Pingree or Evelina had been thrust upon us suddenly fifteen years ago we should have collapsed with a sudden attack of Dianthus monstrosis.

Kathleen Pantlind, as shown by Hopp & Lemke, E. Grand Rapids, Mich., was certainly a very attractive flower.

THE AWARDS.

The awards on seedlings will be found herewith in tabulated form.

Of the special premiums, the Breitmeyer prizes for 50 Mayor Pingree and 12 of same variety, both went to W. N. Rudd, Mt. Greenwood, Ill. The Hill prize for 100 Triumph was won by H. Weber & Sons, Oakland, Md. The Hill prizes for 100 Flora Hill were awarded, first to W. N. Rudd, second to W. P. Craig, Philadelphia. The Ward silver cup for best yellow or yellow variegated seedling not yet distributed was won by F. Dorner & Sons Co., Lafayette, Ind., with Gold Nugget.

Other special exhibits noted by the judges were vases of extra Bridesmaid, Meteor and Bride roses, a vase of very fine mignonette, and vases of carnations Mrs. Bradt, Jubilee and Mary Wood, shown by Bassett & Washburn, Chicago; vases of fine Bride and Bridesmaid roses, shown by the South Park Floral Co., New Castle, Ind.; bunch of Marie Louise violets from Swan Peterson, Gibson City, Ill.; vases of extra Belle Siebrecht, Bride and Bridesmaid roses, shown by Geo. A. Kuhl, Pekin, Ill.; eighteen varieties of carnations of great size and substance (including Hanna Hobart, dark pink, the largest flower in the exhibition hall) from John H. Sievers, San Francisco, Cal.; vase of magnificent blooms of the new pink rose Mrs. Robt. Garrett, from H. Weber & Sons, Oakland, Md.; a very fine bunch of the Princess of Wales violet (stem eleven inches long and flowers of great size), from J. A. Peterson, Cincinnati, O.; lily of the valley, Keiserskroon tulips and Meteor roses, from George & Allen, Cincinnati; vase of very fine Kaiserin roses from W. W. Coles, Kokomo, Ind. The judges making above awards and those on seedlings were Messrs. Wm. Scott, Adam Graham and Wm. Nicholson.

In the following general classes the judges were Messrs. E. H. Michel, E. G. Gillett and W. W. Coles.

Vase 100 white, first, E. G. Hill & Co., with Flora Hill; second, F. Dorner & Sons Co., with White Cloud.

Vase 100 light pink, first, W. N. Rudd, with Mrs. McBurney; second, H. Weber & Sons, with same variety.

Vase 100 dark pink, no award.

Vase 100 scarlet, first, E. G. Hill & Co., with Jubilee; second, W. N. Rudd, with same variety.

Vase 100 yellow, first, W. N. Rudd, with Mayor Pingree; second, F. Dorner & Sons Co., with Gold Nugget.

Vase 100 crimson, first, J. Breitmeyer & Sons, with Meteor.

Vase 100 white variegated, first, F. Dorner & Sons Co., with Mrs. G. M. Bradt.

Vase 100 Lily Dean, first, Wm. P. Craig.

Vase 100 Armazindy, first, Wietor Bros., Chicago.

Gold Nugget.

In the classes for 50 blooms, the South Park Floral Co., New Castle, Ind., won on Alaska, Helen Keller and any other pink lighter than Scott (with Albertini); H. Weber & Sons on Hector, Scott, Daybreak, Eldorado and any other yellow (with Buttercup); E. G. Hill & Co. on any other white (Flora Hill), and Armazindy; Wm. P. Craig on Jubilee; Wm. Murphy, Cincinnati, on Portia; James Hartshorne, Joliet, Ill., on Tidal Wave. For 50 scarlet F. Dorner & Sons won with Dazzle. For 25 blooms pink, lighter than Scott, introduction of 1897, W. N. Rudd won with Mrs. McBurney. For 25 any other color, F. Dorner & Sons Co. won with Mrs. G. M. Bradt.

THOSE PRESENT.

Among those present at the convention were the following:

Wm. Scott, Buffalo.
W. J. Palmer, Buffalo.
D. B. Long, Buffalo.
Adam Graham, Cleveland.
Herman Hart, Cleveland.
S. Pentecost, Cleveland.
Jas. Eadie, Cleveland.
Geo. Smith, Cleveland.
W. P. Craig, Philadelphia.
S. S. Skidelsky, Philadelphia.
V. Groshenz, Philadelphia.
C. W. Ward, New York.
Alex Wallace, New York.
H. C. Rath, New York.
D. McRory, New York.
H. Weber, Oakland, Md.
W. Weber, Oakland, Md.
Albert M. Herr, Lancaster, Pa.
Wm. Swayne, Kennett Square, Pa.
E. G. Gillett, Cincinnati.
R. Witterstaetter, Cincinnati.
Ben George, Cincinnati.
E. H. Giesy, Cincinnati.
A. Sunderbruch, Cincinnati.
J. A. Peterson, Cincinnati.
Wm. Murphy, Cincinnati.
H. Williams, Cincinnati.
W. Schuman, Cincinnati.
Geo. S. Bartlett, Cincinnati.
G. Scheibley, Cincinnati.
J. Baer, Cincinnati.
Fred Breitmeyer, Detroit.
F. Holznagle, Detroit.
Geo. A. Rackham, Detroit.
Harry Balsley, Detroit.
W. Langstaff, Indianapolis.
W. Bertermann, Indianapolis.
E. G. Hill, Richmond, Ind.
J. A. Evans, Richmond, Ind.
Fred Lemon, Richmond, Ind.
J. S. Stuart, Anderson, Ind.
J. A. E. Haugh, Anderson, Ind.
F. Dorner, Sr., Lafayette, Ind.
F. Dorner, Jr., Lafayette, Ind.
Prof. J. C. Arthur, Lafayette, Ind.
W. J. Vesey, Ft. Wayne, Ind.
J. H. Vesey, Ft. Wayne, Ind.
Wm. Nicholson, Framingham, Mass.
W. W. Tailby, Wellesley, Mass.
E. H. Michel, St. Louis.
J. F. Schray, St. Louis.
W. H. Kruse, St. Louis.
Geo. M. Kellogg, Pleasant Hill, Mo.
Henry Smith, Grand Rapids, Mich.
Geo. F. Crabb, Grand Rapids, Mich.
Geo. Hopp, Grand Rapids, Mich.
J. G. Hancock, Grand Haven, Mich.
Otto Sylvester, Milwaukee.
N. Zweifel, Milwaukee.
E. Haentze, Fond du Lac, Wis.
T. C. Joy, Nashville, Tenn.
Jos. Coenen, Louisville, Ky.
Geo. Bayer, Toledo, O.
John Willius, Danville, Ill.
W. W. Coles, Kokomo, Ind.
C. A. Shannon, Princeton, Ind.
J. D. Carmody, Evansville, Ind.
Swan Peterson, Gibson City, Ill.
Jos. Heinl, Jacksonville, Ill.
A. Mitting, Morris, Ill.
C. E. Gullett, Lincoln, Ill.
Alfred Bauer, Rockford, Ill.
G. E. Hunt, Terre Haute, Ind.
J. M. Clark, Des Moines, Ia.

THE BANQUET.

The banquet hall of the Auditorium Hotel was a beautiful sight as the members of the American Carnation Society entered it Friday evening. The manager of the hotel said the decorations were decidedly the handsomest ever seen in the hall, and in it have been held many famous feasts. Along the speakers' table were placed very tall trumpet bases of superb carnations, including the prize-winning vases of Jubilee and Mayor Pingree, while between were long plateaus of other flowers, including American Beauty, Bridesmaid, Bride and Meteor roses, in addition to one of the single trumpet narcissus arranged with its own foliage and bordered with tulips. Similar plateaus appeared on the other tables, interspersed with smaller vases of carnations. The plateaus were contributed by Mr. E. Wienhoeber and were arranged by Mr. John Gormley. Placed in appropriate positions were groups of palms sent by Mr. Geo. Wittbold. Mr. P. J. Hauswirth, chairman of the committee, is certainly to be warmly congratulated on the effectiveness of the decorations.

After the menu had been disposed of, the Toast Master, after a few words of welcome to the guests, proposed a toast to the American Carnation Society and called upon President W. N. Rudd to respond. Mr. Rudd spoke glowingly of the work that has already been accomplished by this comparatively young society and saw great possibilities in the future. He felt that each convention had been an improvement upon its predecessors and he predicted that the Philadelphia meeting would show still further advance. His remarks were received with long continued applause.

The Society of American Florists was next toasted and ex-President Adam Graham, of Cleveland, Ohio, responded in his usual impressive manner. He looked upon the American Carnation Society as one of the most progressive children of the mother organization and he gloried in its progress and success.

President-Elect Wm. Nicholson was then called upon to respond to the

Some High Grade Blooms. Glimpses of the Carnation Exhibition.

sentiment, "The Philadelphia Meeting." He expressed the belief that in the Eastern carnation belt would be held one of the greatest conventions of the American Carnation Society and assured all that he would spare no effort on his part to insure the continued progress of the society.

The "Future of the Carnation" was the subject assigned Mr. E. G. Hill, and, if all the good things he predicted for the "Divine Flower" are realized, the carnation will certainly hold a very high position among the flowers of the future.

"The Whole Thing" was the comprehensive subject assigned to Mr. William Scott and he was equal to the demands upon him. He fairly outdid himself and made an address which will go upon record as the most instructive and entertaining one ever delivered by him, which is saying a great deal.

"Insuring the Carnation" was treated by Mr. W. J. Vesey, secretary of the Florists' Mutual Fire Association, and he told those present some interesting facts regarding the insuring, not of the carnation, but of the houses that contain them.

Mr. E. H. Giesy was called upon to use "The Voice of Prophecy." He complained that all the material for prophecy had been used by the previous speakers, but managed to make some very effective points just the same.

Mr. John Thorpe spoke to "The Old and The New" and told of the varieties which he had brought with him from Europe in the sixties and compared those with the magnificent varieties seen in the exhibition hall at this convention.

A toast to "The Horticultural Societies" was responded to by Mr. W. H. Chadwick, president of the Horticultural Society of Chicago, with a very witty address in which he fully sustained the reputation of Chicago for not being over-modest in its claims as to size and importance. Referring particularly to the exhibitions given in this city, he attributed their success largely to the interest which had been awakened among the amateurs in this city and pointed out that their moral and financial support was necessary to make such exhibitions successful.

Mr. C. W. Ward spoke of "The Carnation in Greater New York" and told of the progress that had been made in securing an adequate price for carnation flowers of extra grade, and cheered his hearers by telling of sales of high-grade carnation blooms in certain seasons of the year at as high as $10.00 a hundred.

Mr. Fred Dorner spoke briefly to the toast "The Divine Flower." He considered the carnation one of the most beautiful flowers grown and believed that it appealed more generally to the hearts of the people than any other.

Secretary Albert M. Herr spoke of the progress that had been made during the past year and expressed the greatest confidence as to the future.

A toast to "The Horticultural Press" was responded to by Mr. Alex Wallace of the Florists' Exchange. He believed that the horticultural press had been an important factor in the progress of the carnation through its reports of what had been accomplished by the various growers and through spreading to the whole trade reports of the work of the Carnation Society.

Mr. R. Witterstaetter spoke of "The Carnation in Ohio." He admitted that Ohio did not stand so high on the roll as its sister state of Indiana, but held that the "Buckeye" state was doing its share towards the advancement of the carnation.

Mr. J. S. Stuart spoke of "The Carnation in Indiana" in a very entertaining and witty address. He felt that Indiana stood very near the top of the list in carnation culture and spoke in particular of the great work accomplished by Mr. Fred Dorner.

The subjects were interspersed with singing by the Chicago Florist Club's Quartette, composed of Messrs. C. W. McKellar, E. F. Winterson, E. H. Kissell and Chas. Balluff. The quartette was a decided feature of the entertainment and it was well that the boys had an extensive repertory, as they were obliged to respond to numerous recalls.

The party dispersed at 12:30 A. M., all feeling that they had spent one of the most enjoyable evenings of their lives.

MOISTURE THE PLANTS GREATEST REQUIREMENT

By Prof. J. C. Arthur.

[Read before the Chicago Convention of the American Carnation Society.]

That which is most common usually provokes least attention. The fact that water is connected with all kinds of life, that it is a universal solvent, and that it is taken up freely by organisms, and evaporated from their surfaces in large amounts, encourages indifference toward the subject rather than excites interest. Water hides under no disguises; it is always seperable and recognizable; it does not partake of the mysteries of the food supply.

The man who undertakes to protect plants from the accidents of outdoor life by housing them under a canopy of glass, becomes the step-parent to nature, and will succeed best when he most fully understands the needs of the charges intrusted to his care. It does not follow that the greenhouse cultivator is to imitate nature in her methods of supplying the wants of the plant; more economical, more direct, and more efficient methods are often possible, and in fact are often necessary to secure commercial success.

Because out of doors it rains on the just and unjust alike is no reason why the florist should drench everything within his houses daily. Overhead watering under glass may be a good imitation of nature, but it is not necessarily the way to bring about the result the florist has in view, healthy plants with a maximum development of flowers. The watering pot and its substitute, the spray nozzle, are to

be considered primitive implements, which are to be laid aside as soon as improved methods can be devised. A move in this direction has been made by carnationists in using a modified nozzle and applying the water to the soil without wetting the foliage.

It is because the carnationists have shown themselves progressive, and willing and ready to test promising innovations, that I venture to advocate to-day a radical change in watering the greenhouse, and one that requires some expense to inaugurate. I remember with pleasure the reception of my paper before this society at its Buffalo meeting, in which I suggested watering carnations between the rows and keeping the foliage dry as far as practicable.. Although the wraith of the red spider seemed to hover over the assembly and threaten grave disaster to such a course, yet the suggestion was tested, approved, and under various modified forms became a part of standard carnation culture. I now come before you to advocate watering the benches from beneath the soil and practical abandonment of surface watering and spraying. It is sometimes called sub-irrigation, but a better term is sub-watering.

The essential feature of this method, which was originated at the University of Ohio, and has been tested in a number of places for various glass-grown vegetable crops, consists of a water tight bench with a layer of open material on the bottom through which water moves readily, and the filling of the bench completed with soil in the usual manner. The bench is kept moist by supplying water to the porous layer beneath, from which the soil takes it by capillarity. No water is applied directly to the soil, and all use of the nozzle is done away with. Before giving the working details of this method, I wish to call attention to some of the reasons why watering plants should be considered a matter of great importance and worthy of the most careful study.

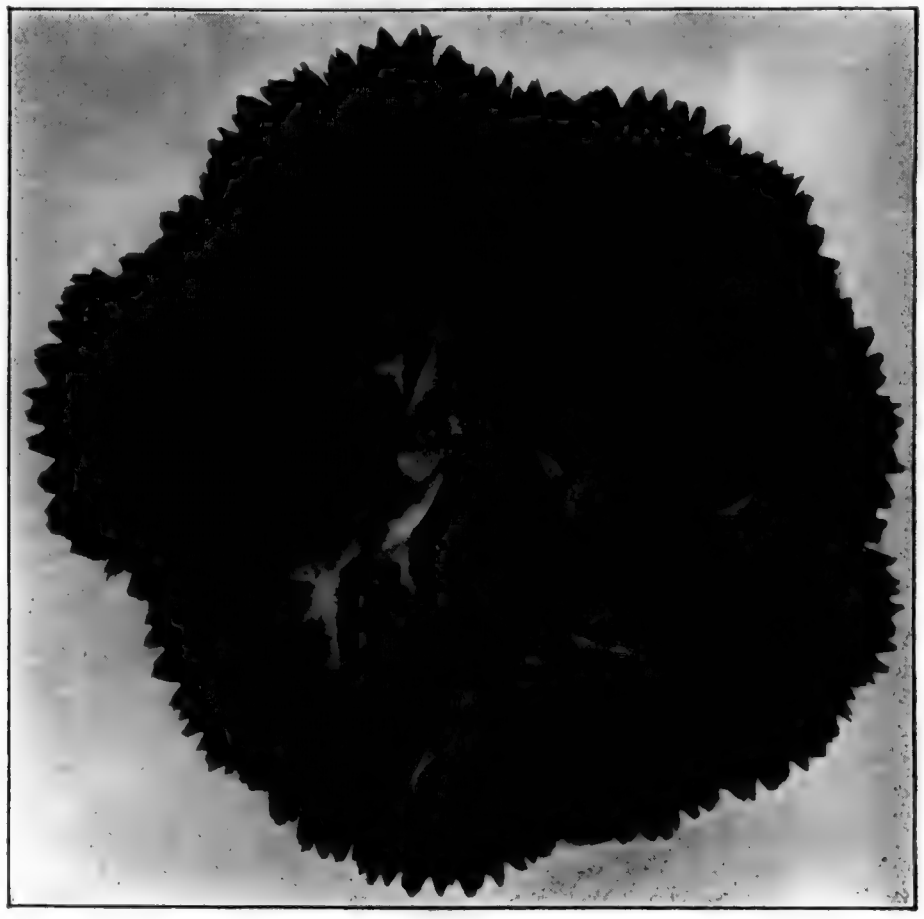
In the first place, every plant, generally speaking, consists of three parts of water to one part of all other kinds of substances. This proportion is quite universal for all living things. It is equally true of trees, grasses, mosses and moulds. It also holds for animals. A cabbage plant and the body of a dog do not vary much in the proportion of water to solids.

Immature organs contain more water than when matured. Although the water in a whole carnation plant—roots, stems, leaves and flowers—amounts to about 75 per cent of the total weight, yet in the young shoots, such as would be suitable for cuttings, it rises to 90 per cent, and in the half-formed leaves is even greater yet. If we remember that the chief growth of the plant takes place in the parts where the largest amount of water occurs, we shall be reasonably safe in inferring that water is a very essential factor in growth.

It has been ascertained, in fact, that the tissues must not only be saturated with water, but they must be supersaturated—that is, contain so much water that every cell is distended with the pressure—before growth will proceed. Each cell must be stretched by the internal pressure of the water, as a toy balloon is distended by the air forced into it. It is this by no means inconsiderable tension that renders young parts firm and brittle, and when it is removed they wilt. No appreciable growth can take place in leaves and stems that are wilted, or in a wilted condition. In the carnation the cell structure is so compact and the walls so rigid that the loss of water is often very considerable before visible wilting takes place. At this point lies a danger, for the plants may suffer for water for some time before the attendant notices their condition. With ideal treatment the plants should never wilt, and never lack for water to enable them to grow.

Not only must a certain amount of water be present in the plant to secure its active development, but a stream of water must be passing through the plant constantly, from the roots to the leaves. This upward flow of water is essential to most plants. It is the means of taking in the various fertilizing materials, or food substances, from the soil, and transporting them to the upper parts of the plant, where they enter into the solid structures forming the tissues. The root hairs on the fine roots suck in the soil water and its burden of nutritive material and force it forward into the larger roots and the stem with pump-like activity, so long as the water is available. The leaves dispose of the water by allowing it to escape from their surfaces as an invisible vapor, leaving behind all substances held in solution.

In some instances the water passes out through any part of the surface, but there are always stomata—minute openings, sometimes called breathing pores—which permit it to escape much more readily. The carnation has the surface of all green parts, both stems and leaves, overspread with a layer of white wax, which is impervious to moisture. All transpiration must therefore be through the stomata. These openings are very numerous, there being from 100,000 to 500,000 on every leaf. Unlike most plants, the carnation shows no material difference in the minute structure of the upper and lower surfaces of the leaves. They contain no spongy tissue, and have the stomata distributed evenly throughout, both above and below. If one should look through glasses that magnified as much as a common microscope, the leaf would appear to be thickly studded with round openings, like little wells, and peering into one, some ways below the surface would be seen a double valve that automatically opens and closes, much as the lids open and shut to permit or prevent the passage of substances into the mouth. These are the guard cells, and when they are shut, little or no moisture can pass out or in. There are two conditions especially under which the stomata are closed; the first is when the plant wilts. This is a fortunate arrangement, for it tends to prevent loss of moisture at a time when the roots for some reason are no longer able to supply the needs of the plant. The second condition closing the stomata is when water is dashed over the plant. A drop falls into each opening and causes the guard cells to swell until they effectually fill the passage. It matters not how much water the roots are taking in at the time—the whole water system of the plant is clogged, and development is retarded.



Sometimes the movement of water through the plant is stopped even when the stomata are open; for when the atmosphere is saturated it is evident that evaporation from the plant must necessarily come to a standstill. Perfect saturation of the atmosphere is probably rare, even in a closed greenhouse, but partial saturation must in a measure check the internal water stream, and in so far must be detrimental to the best development of the plant.

If there is anything that the structure of the carnation plant and the known functions of the organs clearly teaches, it is that there should be a never failing supply of moisture for the roots and a fairly dry atmosphere for the foliage. I venture to say that these conditions cannot be better met than by sub-watering. The present method of surface watering, even when most skillfully done, probably never gives the plants the full amount of water they would use. The soil is alternately too wet and too dry, and besides often suffers from a lack of water at the bottom of the bench, although the surface seems wet enough. The difference between the amount of growth when an ample and constant water supply is provided, and that secured from the usual surface method of watering, is always a source of astonishment when fairly tested, and the results clearly set forth. I have no data to present in growing carnations, by the new method of sub-watering, and will not detain you with figures taken from crops of vegetables, but that the carnation will respond to this method, as have other plants, there can be no doubt.

One other point needs mention in this connection. The physical character of the soil has much to do with successful cultivation. Some writers maintain that it is quite as important an item as the food supply. With sub-watering, the soil remains light and friable, readily permeated with oxygen from the atmosphere, easily penetrated by roots, and at all times in the best of condition for serving the plant. The soil of the bench once suitably prepared for the reception of the plant remains so, or even improves

on account of the upward movement of the water through it. This is in marked contrast to the compacting that follows every application of water to the surface. Surface watering drives out the air from the soil at each watering, keeps the upper layers wetter than beneath, and makes it difficult to provide for the needs of the deeper roots.

Besides the advantage of sub-watering which I have mentioned, there are others which are incidental features, but by no means unimportant. One of these is the freedom of the surface of the soil from weeds, moss and slime. The surface layer can be kept quite dry, and act as a mulch, if desired, and at any rate it will be the dryest soil in the bench. The dryness of the surface of the benches, and of the air throughout the greenhouse, will have a marked effect in preventing and holding in check all kinds of parasitic diseases, both fungous and bacterial—a desirable result that the carnationists are fully able to appreciate. The causes which prevent the inroads of germs, promote the functional activity of the leaves on the lower parts of the plant, and they remain green and

General Maceo.

healthy much longer than usual, greatly to the advantage of the plant.

It is evident that the writer believes that the proposed system of sub-watering is in many ways a good thing, and nowise injurious. He also believes that it can be made commercially profitable. A trial bench at the Indiana Experiment Station, which has been in use two years, chiefly for lettuce, is fitted with a water-tight lining of zinc, on which soft building brick are placed edgewise, their lower angles having been chipped off to permit freer movement of water between them. On this layer of brick the soil is placed in the usual manner. The water is run into the bottom of the bench through vertical tubes at intervals along the front, and at the rear overflows are provided at an inch above the bottom to guard against accidental flooding. Gauges, consisting of a simple bent tube, show when the water is exhausted. The bricks take up the water and pass it on to the soil above, slowly and uniformly. By running a water pipe along the bench, opening into each vertical tube, the whole bench, or the whole greenhouse, can be watered at once by turning a single stop-cock, and thus do away with one of the time-consuming features of greenhouse work. Whether this be the best way in which to provide for sub-watering, time will reveal, but it is efficient, lasting and not expensive beyond profitable returns.

I have pointed out that the plant's greatest need is water; that three-fourths of its substance is made up of water; that it directly controls growth by maintaining internal pressure; and that a constant stream through the plant is required for healthful development. I have called attention to the disadvantages in supplying the plant, especially carnations under glass, with water in the usual manner, and not wishing to be opprobriously called a theorist, lacking practical ideas, have pointed out a better method, which has had some preliminary trial. I shall feel that I have not misjudged the importance of the matter to commercial growers, if any members of

this society should find it profitable to make practical application of the suggestions of the paper.

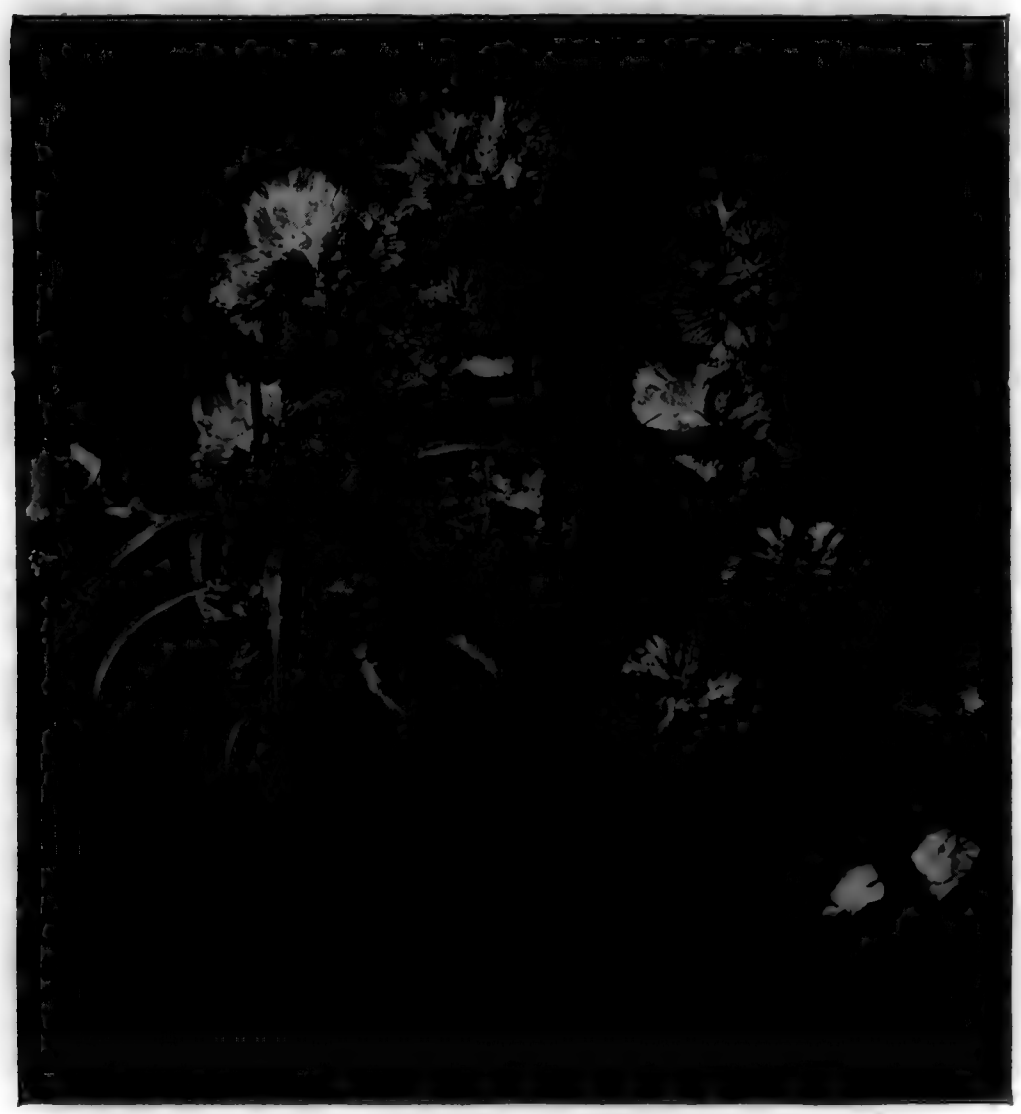
INTRODUCTION OF NEW CARNATIONS.

By Fred. Dorner.

[Read before the Chicago Convention of the American Carnation Society.]

The introduction of new varieties, and their commercial value, so far as it can be ascertained; what are commercial varieties and in what does their value consist? I believe many entertain erroneous ideas, that will lead to erroneous opinions and conclusions, detrimental to a progressive evolution of the carnation. The general conception of a commercial variety in the first place embraces quantity, quality being of secondary consideration. If so many flowers are cut to a plant, so many thousands marketed and sold from a house, it is conclusive to many. That they were sold shows that quality was of a grade sufficient to effect a sale. But now let us go a little further and compare these commercial varieties with some that are not so prolific in quantity, but superior in quality, and consequently, according to this idea, outside the apprehended range of a commercial variety.

Let us compare prices at which these different varieties are generally sold; if higher or lower, the difference remains proportionately the same. Suppose 100 blooms, the product of three plants, are sold at $2.00, or 2 cents each; now, according to my experience, the following grades, all the product of three plants, can be grown at the same cost, but as quantity diminishes, quality improves: Ninety blooms may bring $2.25, or 2½ cents each; 80 blooms may bring $2.40, or 3 cents each; 70 blooms may bring $2.45, or 3½ cents each, and 60 blooms may be sold at $2.40, bringing as much as the 80 blooms. Now it is not uncommon that an extra fine variety is sold at $5.00 per 100, but we will allow only 50 blooms to the three plants, that is, half of the first realize $2.50, or 50 cents more for half the number of blooms, though of superior quality. I believe I am only stating facts as they appear every day in every flower market of this land. Fifty cents more on the returns from three plants does not seem very much, but on a house full, say about 2,000 plants, it aggregates to $330. What is of the greatest value in a variety, quantity or quality? I believe we had better relegate these apprehended commercial varieties to the second rank and pay more attention to the others. It is always acceptable when we have a variety of fine quality, and one from which we can cut many blooms to a plant, but the trend in improvement includes size also, and we go rather beyond Nature's power if we expect both at the same time.



The introductions of new varieties in the past have in many instances been failures, resulting from different causes; some from natural consequences that could not be foreseen, but often neglect, ignorance and avarice, an overtaxing of Nature's ability, are potent factors, which place the introduction of new varieties in an odious light. Disappointment and losses, as they are too often experienced, make the purchaser suspicious of the new varieties offered every year; he expects for his good money what he is offered in the growing advertisements. We must admit that there are causes where the disseminator cannot be held responsible, such as change of location and different mode of treatment, though these are by no means the least. But there are others that can be avoided by a conscientious grower. A novice in the originating and growing of new varieties is only too apt to overlook defects. In the admiration of his work he looks with loving eyes at his pets; and let me tell you where new varieties are treated as pets, a rigid, thorough trial, such as is necessary to determine the good and bad qualities of a variety, is impossible. Another cause is a too high culture in the effort to make a good showing, which cannot be maintained under an ordinary culture for profit. The growing and introduction of new varieties is a business, and as in every other trade, one must be prepared to meet misrepresentations by unscrupulous people. On the other hand, when a grower conscientiously gives his new varieties a thorough trial that convinces him of their true value and justifies him in a dissemination, he expects a compensation that will pay him for his work, and can hardly be held responsible for shortcomings that may afterwards appear, and of which he was unaware.

As our present mode of judging new varieties is carried on, the exhibitor has largely the advantage over the one who depends on the decision of the judges in the investment of new varieties. The judges can only judge what they see; whether the exhibitor would have been able to make a similar showing one or two months earlier or later is outside of their province, as is also a true representation of the habit. The showing of one plant with the exhibition bloom has the same element of uncertainty. Various suggestions have been offered to alleviate these discrepancies in our system of judging. One is a suggestion to send judges to the exhibitors' establishments and see the candidates for certificates at their homes. To see them once, would be, in my opinion, not much better than the present system, and to see them several times would, by the increasing number of seedlings grown every year, cause more expense than the society or the growers would care to shoulder.

One other suggestion is to appoint stations for trial in different parts of the country. This meets with opposition from the growers, for it can hardly be expected that they should be of such a philanthropic disposition as to scatter their new varieties over the country. And if the growers would favor such a proposition, judging from present indications, a large house would be filled with the applicants for honor at each station. Who would undertake such a venture, and who would pay the expenses? What we need is a system that determines the value of a variety through the most important time of the season, at least; not only when they can be shown at their best, but with the defects exposed without encroaching on the rights of the grower; and further to give a purchaser, who takes the verdict of the judges as a guidance, a chance to judge to some extent for himself. Such a system, I am of the opinion, could be arranged, and besides would be inexpensive, as I will illustrate further on.

Our carnations being in the market the whole year, we would like to know how a new variety behaves, at least during the most important part, the late fall and winter months. Now why not imitate the Chrysanthemum Society by appointing standing committees in the principal cities, and let them sit once a month for five successive months, say on the 15th of November, December, January, February and March, respectively. It is to the interest of the exhibitor to exhibit a variety with as many committees as possible, if he is fortunate to possess enough stock to do so, but he has to show the same variety each month to at least one committee, and if it scores three times the required number out of the five times shown, it will be entitled to the society's certificate. If a grower wishes to magnify the value of his certificate he has only to show on a large scale, that is, with as many committees as possible. If sent from a distance the condition in which the flowers arrive should receive special mention. By missing to show at any of the appointed times, would indicate that the grower's plants are not blooming at that time. If a shipment should accidentally get spoiled in transit, the exhibitor should at once be notified, and allowed to make another exhibit, to be judged within a week's time. If a grower wishes to disseminate a variety during the season of judging, and can score sufficiently high the first three months, a certificate will certainly be of value to him. A certificate received under this mode of judging is valuable alike to the disseminator and those who wish to invest. To further enhance its value to the latter, the results of each month's judging should be published at once in all of the trade papers, not only mentioning the aggregate of points scored, but giving the points awarded on each characteristic of the flower as well as the total.

To know exactly the specified points a variety receives, it is of the greatest value to those who wish to buy. In this way the purchaser, having a record in the publications, is to a large extent his own judge and the committees are the appraisers. By publishing the whole, the line drawn by the limit of 85

New Striped Carnation Sandusky.

points securing a certificate; 84 points is not so severe, and a variety missing a certificate by a few points may yet prove valuable to many when they can judge for themselves, knowing in what respects that particular variety is deficient. True, the judging of the different committees, as is the case with those judging chrysanthemums, may not at all times coincide, but we cannot alleviate that; judges are human, and without questioning their integrity may involuntarily be influenced by their own fancy and taste. This may frequently happen respecting the points of form and color, but a specific record will enable us to draw our own conclusions, and partly judge for ourselves. A certificate always signifies a certain amount of perfection and cannot be overestimated, but the line drawn as in the past, with 85 points as good and 84 points as bad, is too harsh when not wrong.

At the time of our annual meeting and exhibition, every exhibitor before the different committees should be requested to make an exhibit with the record attached to it, as judged by the committee the months before, for the inspection of all visitors. This would be my idea of judging seedlings; the quality of the blooms every month speaks volumes as to the habit of the variety. Again, there could be made two classes, second, third year and over, the same as at present. It would probably cost the growers a few more flowers, but they are always watching for any chance to make an exhibit wherever an opportunity is offered, and I suppose they are willing to use the flowers where the most good will result.

If a wise, impartial judging of new varieties can be introduced, equally satisfactory to the disseminator and the buyer; when this system of judging brings to our knowledge not only the value of a variety when it is at its best, but what can be expected from it at least during the most important part of the season, when our society can accomplish this, it will control the introduction of new varieties, and if carried out in an impartial, open way, will gather around itself the progressive and impartial element, and reach the highest point of its usefulness. Many will not admit, but it remains nevertheless a potent fact, that the interest manifested in new varieties centers in the Society of American Carnation growers, and is its moving spirit; remove it and the society will crumble and decay.

RECOLLECTIONS OF CHICAGO AND CARNATIONS.

That Harrison street is not beautiful, particularly in sloppy weather.

That the external appearance of a refreshment house is a very unreliable guide to its internal attractions, even if it is in the business part of State street.

That the roast beef served you at the Auditorium is of a quality that don't drop off at many cities, and both it and the oatmeal and cream are of a high grade.

That the man who first called the carnation "the divine flower" would need a string of superlative adjectives could he see Evelina.

That we found ourselves most pleasantly situated while taking notes of the show. In fact, we envied none present, and it was all too short.

That Mr. Chadwick is a most finished after dinner talker, and Mrs. Ruggles and other illustrations were very pat. We have put them down with a cross opposite the title.

That the quiet good-natured, yet dignified chairmanship of President Rudd was most charming.

That florists can sing as well as grow and ship flowers, at least in Chicago.

That the new method of sub-irrigation was entirely unnoticeable in its application to any of the florists present.

That Mr. Grant makes an ideal chairman. A chairman has a great chance to abuse his position if he is cursed with exuberant verbosity.

That the little anecdotes and parlor stories intercommunicated after the regular sessions are very edifying if spread over long periods of time.

That the quantities of glass structures which some of the florists call "slight additions" to their plants took our breath away.

Finally we recalled with great regret that we could not accept the invitation of Mr. Bassett and visit his mammoth and model place. And still more regret that the heavy slumbers of our companion continued till 9 A. M., thus causing us to miss the looked for visit to Mr. Dorner's at Lafayette, and his wonderful collection of carnations.

We fail to recollect a much pleasanter and more instructive time, and pity those absent, for they don't know what good company and seltzer water will produce to the health and spirits.

W. S.

EARLINESS OF LILIES AND SPIRAEA.

Would you kindly inform us about what temperature Easter or Harrisii lilies should be kept that at this time are just showing bud, to have them bloom at Easter? We have them in our carnation house at present, with about 50 to 55 degrees night temperature. Also at what temperature should

we keep our Spiraea compacta that is about 6 inches high and showing bud nicely at the present time. E. E. S.

I would say that "E. E. S." is fortunate in having his plants in the condition described. In a night temperature of 50 to 55 degrees the lilies, unless we have bright and warm weather beyond the average, will be just about right. Don't be afraid that they will be a day or two early. We have learned to our cost that a lily with two open flowers and buds to open is not what our customers want. They want the flowers all out, and supposing they were all out a week before Easter, you can keep them perfectly a week or ten days. You are all right—in excellent condition. As I have often had occasion to remark, in a batch of lilies planted the same time and brought along in the heat, they will vary very much in the time of their flowering, and many moves are often necessary, but they should not be subjected to great changes of temperature, particularly a lowering, for that is very unnatural. Endeavor to have the bulk of them come about right, and those that show that they will be late can be given more heat.

Spiraea is perhaps a trifle early. Keep it at not over 50 degrees and you will be all right. Give plenty of light and abundance of water.

W. SCOTT.

ORCHIDS

ORCHID NOTES.

Cattleyas. As the sun strengthens C. labiata will claim your attention. Those that flowered early are impatient, but on no account encourage them, rather keep them as quiet as possible for a week or so yet. But it is in order to go over them, and remove last year's topdress, by which I mean all loose material that can be removed with a sharp pointed stick, without disturbing the roots, and fill in all slack spots with noddles of peat.

Any repotting that is thought necessary may be done now, but this is an operation that I would not advocate unless absolutely necessary. If the plant has abundance of root and a good hold of the material, leave it, but should it be in a bad condition with little or no root, shake it out and remove all dead and decaying matter, thoroughly wash with the hose, repot or basket, giving very little material around the roots, and treat as you would newly imported stock. If redemption is possible they will soon show signs of activity; let the leaves make some headway and have a decided root action before you topdress with sphagnum.

Also let C. Percivalliana, maxima, chocoensis, etc., then have your attention, but keep at the cool end of the house for some time yet, bearing in mind that the longer the rest the better the lead. And see that C. Trianae, Mossiae, gigas, etc., do not suffer for want of water. If the flowers are formed at the expense of the last growth they will break very weak and indifferently.

Laelia autumnalis, anceps, and its varieties, will also bear looking over. They require but very little material at the root; what they have should be fresh and sufficiently firm to retain the moisture. See that they don't suffer through lack of water while resting. And the various autumn flowering oncidiums will soon be on the move, and as those are naturally epiphytal they must have good drainage. Small baskets are the most suitable receptacles for these subjects, and they require to be packed very firm, as you do them up, and if grown in pots, they should be raised on a cone-shaped mound above the rim of the pot. When growing they enjoy a copious supply of water, but during the resting period, only enough should be given to keep the bulbs in a plump and healthy condition.

Dendrobium formosum and D. Phalaenopsis should be cleaned off and removed to their growing quarters, at the same time attending to any repotting required. Any Dendrobium nobile or Wardianum that may have flowered early should have the same attention. Do not repot in any case if you can avoid it, simply add a little fresh material where necessary and water sparingly until they show good root action. Maintain a temperature of 70 degrees with plenty of atmospheric moisture, and give liberal treatment eventually.

Some growers, will, I have no doubt, think it bad practice to start the last named subjects out of season, but the commercial man has no hard and fast rule to go by. He understands an early start means an early finish, and the secret lies in the finish, to know just when to withhold water and enforce rest, but should they start into a second growth unobserved, let them go; they have ample time to finish a second growth which will flower along with the first if properly handled.

J. ROBERTSON.

VIOLET NOTES.

Of all our experience in growing violets, this season "takes the cake," if I may be allowed the expression, for we are between two fires. At this time of the year we should be nearly sure of a fair amount of nice, clear weather, but as it is we get one day in seven very bright and sunny, one or two with thin clouds so that the effect of the sun can be felt to a moderate extent, and the balance of the week will be a sort of miniature Klondike spell (perhaps in order to settle the minds of the hesitating florist who is of more than half a mind to try his luck in those regions). The result is that you hardly know what to do in regard to shading your houses.

Those who grow their violets in houses running north and south do not need to shade as yet, but those growing theirs in regular east and west houses, under ordinary circumstances, should shade their south slopes lightly now, adding a thin coat from time to time as the sun gets higher and the days longer and warmer. Those who grow them in the new "slope" houses, in an ordinarily light season, should shade as early as the first week of this month, in this latitude, as such houses are so light that they bleach the blooms more than the other styles of houses, if not early protected in this way.

Those growing the Lady Hume Campbell exclusively can stand the additional rise of temperature well enough, as it flowers more freely at a higher temperature than the Marie Louise; on the other hand, it fades more quickly, and so needs the shading for that reason. On account of this tendency to fade, more care must be exercised to keep them closely picked, as soon as fully developed, and their size and full, round makeup are something astonishing when allowed to develop, and that their fragrance is much greater than the Marie Louise at all times is, I think, a fact admitted by all.

R. E. S.

BORDEAUX MIXTURE.

Please print at some convenient time the best way to make a barrel of Bordeaux mixture, with a few directions for use on chrysanthemums and celery. W. M.

Dissolve one pound of sulphate of copper in two or three gallons of hot water. Use a cast iron or earthenware jar for the purpose, for the copper will soon eat holes in a watering can. When

dissolved, slake three pounds of quick lime with the liquid, and then put the whole into forty gallons of water. Fostite is about as good as the dry Bordeaux mixture; instead of quick lime, in Fostite the copper is mixed with French chalk.

When the lime has settled at the bottom of the barrel the mixture is fit to use. The under side of the leaf is the part you want to get at, and a good hand syringe is the thing with which to apply it. A syringing once a week will do on chrysanthemums. Begin early on any that you apprehend rust will appear. It will not restore chrysanthemums to perfect health if they are once affected with rust, but it will arrest and prevent its spread.

I am not in the celery business at present, and when I was Bordeaux mixture was like the vitascope—not so well known. If it's rust on the celery you are after, the most expeditious way would be to take the young plants by the roots, a handful at a time, and dip them in the mixture just before planting. This is a most thorough way, and a plan I have pursued with young carnations before they go into the sand, and when they come out; by this method, every portion of the leaves is wet, and if there is any efficacy in these mixtures, they get the full benefit of it.

W. S.

A CONVENIENT SOIL TRAY.

Many florists have the soil necessary for potting and re-potting plants placed on the potting bench where it is to be used, while others prefer to use it from a box or tray. A wooden box is cheap and convenient, but it is apt to shrink so that the fine soil works through the cracks, and the end becomes worn in time by knocking the pots against it to turn the plants out. For several years we have been using trays made of galvanized iron, of the form shown by the illustration. They are tight, have good handles, and are durable. They were made for us by a tinner here, and cost $1.25 each. They are 2 feet long, 15 inches wide, and 5 inches deep, are made wider at top than bottom, and have plenty of wire around the rim to stifen them. The projection at one corner is a block of wood half an inch thick, extending an inch above the rim, to knock the pots against in re-potting. This tray can be used on the ordinary potting bench, or may be taken into the plant house, saving the labor of carrying the plants out and back when re-potting. If a piece of shading muslin or heavy paper is spread on the bench where the work is done it will keep the sand clean, or the soil tray may be set on a box of suitable height standing on the walk.

W. T. BELL.

GRAPES CRACKING.

"W. M." writes: "Will W. Scott or any of your correspondents inform me how to grow Mandresfield Court grapes without having them crack? I grow them with Muscat and Barbarossa, but as soon as weather comes they crack when beginning to color."

I have not grown the fine variety mentioned above, and, strange to say, in looking through a high authority on grapes, this trouble of cracking is not mentioned. But the writer is well acquainted with this serious cultural defect, and when growing Golden Hamburg and some others, lost many bunches by their cracking. I must have learned or heard from some one at the time the following remedy: Just before coloring, or, as they say technically, after they have "stoned," and during their last swelling, take a sharp penknife, split the stem of the bunch an inch or two above the bunch, and insert a very small piece of wood to keep the incision from closing. It worked satisfactorily with me, and no

A Convenient Soil Tray.

more cracking occurred. This bursting of the skin of the grape appears to be caused by too great a flow of sap to the berry, the skin of which does not expand fast enough or is not elastic enough to bear it. I don't think temperature, ventilation, soil, or water has anything to do with it, or that modification of these conditions would prevent it.

W. S.

BALTIMORE.

Increased Trade on Valentine's Day.

The past week proved an eventful and busy one for all concerned in the florist line. The retailers have been especially busy, owing to the unusual number of social events, which have now practically wound up the season. Valentine's day was more than usually observed in a floral way. Violets, as usual, were the most popular, while myosotis, carnations, orchids, tulips, hyacinths, valley, mignonette, jonquils, etc., found favor accordingly. Roses had a steady sale. Azaleas, cinerarias and potted arrangements of bulbous stuff also sold well. Besides Cupid's Valentine dances, there were innumerable teas, luncheons and receptions, while the Hunt ball (one of the season's most brilliant affairs) created quite a large demand for bouquets, handsome boutonnieres, etc.

Stock at the commiss'on houses has been plentiful, with the exception of roses, Beauties and Maids being especially scarce. Orchids, which are becoming more and more popular, are by no means equal to the demand. They could be made to pay if grown in larger quantities.

Gardeners' Club.

At the last regular meeting of the Gardeners' Club, Monday, February 14, the roll call showed an unusual attendance of over seventy-five members, the attraction being carnation night, besides including several other interesting events. Despite the fact that the full list of our carnation growers did not exhibit, the show was a decided success, quality having atoned for lack of quantity.

In Messrs. Halliday Bros'. exhibit was seen an exceptionally fine vase of Scotts, which were awarded a certificate of merit; also McGowans 3¼ inches in diameter, Victor, Daybreak, Tidal Wave, and other unusually well grown varieties were shown. A red seedling of Messrs. Woodfall Bros. was next in order, while a white seedling of Mr. C. M. Wagner, and a sport shown by Mr. I. H. Moss, also received the committee's special mention. Among other exhibits which caused general admiration was a vase of very fine Farquhar violets, grown by I. H. Moss, and a specimen of cineraria, grown by C. M. Wagner. Messrs. John M. Rider, P. C. Erdman, Cook Bros. and Thomas E. Stevenson also made very creditable displays.

Mr. Woodfall next entertained us by his essay on "Cross Fertilization," which proved a clear, cogent and businesslike paper. In his remarks Mr. Woodfall reminded us that "fools often step where angels fear to tread," and this proved an excellent simile to demonstrate his theory that the best results of fertilization are more often due to "chance shots" than to the guidance of scientific rules.

Question Box.

What is the best white carnation? General opinion was in favor of Flora Hill. Glory of the Pacific was decided the best outdoor pink chrysanthemum. Does Spiraea japonica require regular feeding? Not if first planted in rich soil.

What is the best keeping carnation? Mr. Erdman considers McGowan. In what night temperature should carnations be grown? Answered 50 to 55 degrees. Name six best azaleas for florists' use. Mr. Feast answered, Vervaeneana, Empress of India, Deutsche perle, Simon Mardner, Bernard Andreas Alba and Mme. Van der Cruyssen. What will kill short-tailed mice? As this question caused general merriment, Mr. Rider reminded us that he had made the inquiry, and the subject was "not at all funny." Mr. Wagner recommended "Rough on Rats" and raw eggs. The writer, however, begs to call Mr. Rider's attention to the article upon "Rats and Mice," issue No. 11 of The Florists' Review.

A vote of thanks was passed by the club for complimentary courtesies received from The Florists' Review.

At our next regular meeting Mr. W. P. Craig, of Philadelphia, has been requested to give us his observations while attending the Carnation Society's conventions.

A banquet to be held election night, the first meeting in March, is now in the hands of a committee.

The first installment of "Dutch Bullub" growers has landed. C. F. F.

CLEVELAND.

A Lively Trade St. Valentine's Day.

"Hooray for St. Valentine. Likewise hurroo and hurrah!" These and other expressions of approbation would probably indicate the florists' feeling toward the gentle saint. If he were with us now the florists' vote would probably help him in a campaign for the presidency of this great and growing republic, and, seated in the presidential chair, he might in turn help a little in some legislation for the benefit of floriculture in general. Who knows but what that national charter might be forthcoming shortly.

The foregoing is not insanity, but is merely a means of conveying the information that one of the days that has heretofore never called forth the general use of flowers in any such degree as the occasion would seem to justify, is beginning to improve in that point. Perhaps it may eventually become as important to the florist as Easter or Christmas. A day like that, approximately half way between the two above mentioned holidays, at a time of year when flowers can be had in good quantity and variety, at fair prices all around, would add immensely to the average floricultural exchequer and help quite a little to rid us of the surplus incubus. As it is, florists all report very good business on the 14th—much better than the same date in preceding years. In some instances it came pretty near being a case of "sold out," which condition is most unusual at this time of year. The demand ran largely for choice flowers—not in large orders, but dainty effects were preferred.

Stock.

Aside from this little extra flurry, business has been on the whole satisfactory. There has been a good, steady demand. Funeral work in many instances has helped considerably in using up stock, so that there has been little reason to complain of waste where stock has been of reasonably good quality. Flowers have been of good quality as a rule, although carnations show a good deal of variation, some being excellent in grade, though with a percentage of lower grade stuff. Roses are very good, and, like other flowers, are being offered somewhat more freely than at previous writings. The price continues on all stuff very near to rates given at earlier writings. Whether these prices can stand the pressure of Lent remains to be seen.

The Chicago Meeting.

The five pilgrims to Chicago returned in good order, sound in wind and limb, and with glowing reports of Chicago and all thereunto appertaining. The exhibition was wonderful and the entertainment royal. The Philadelphia gentlemen will have their work cut out to furnish a better managed and more satisfactory "experience meeting" than that of Chicago '98.

The Cleveland delegation stopped off on their return trip to see Messrs. Dorner & Sons' place at Lafayette, where they found everything in the condition that has made the Dorner establishment proverbial. The carnations, and, indeed, everything, formed a wonderful sight to those accustomed to seeing carnations as ordinarily grown, and will be, with the remembrance of the cordial hospitality shown, a pleasant memory for all who had the good fortune to be there.

The weather continues about as usual so far this winter—mild, but rather lacking in the matter of sun.

NEMO.

ST. LOUIS.

Popularity of the Divine Flower.

The week just closed was a busy one among the florists, and the growers are getting top prices for all their products. Roses of all kinds are holding up well and bringing good returns. The carnation growers are in high glee, as this flower has been in great demand since the first of the year. It was never known in the history of the commission men when carnations sold so well and brought such high prices at this time of the year. The commission men report an increased shipping demand, and orders of this kind were unusually heavy.

There have been a few large weddings and receptions, and the west end florists report that they were kept busy with dinner and luncheon decorations. The transient trade has also been good with the down town florists. This state of affairs had a good deal to do with so few florists attending the carnation meeting at Chicago last week. Next week we will probably have a different story to tell about business, as Lent commences this week Wednesday.

Prices.

Roses in most all classes are scarce. Those coming in are of improved quality, and there is no apparent quantity of any one variety. Beauties were as usual scarce, with a brisk demand for long stemmed stock, which was not obtainable at any price. A few short ones were selling at from 10 to 25 cents each. Bridesmaids find a ready sale at $8 and $10; Brides also in great demand at same price; Meteors, very scarce, at $10 for the best, some short ones bringing $5 and $6; Woottons and Perles in fair supply, and bring $5 and $6; some smaller ones were sold at $4.

Carnations have the call at present, and all fancy varieties bring $5 per hundred. Daybreaks, Scott, Wocher, and all whites sold at $3 and $4. The very poorest carnations brought as high as $3 per hundred.

Bulbous stuff of almost every variety has sold well. Daffodils (Von Sion) are selling at $4; Dutch hyacinths, all the light shades, in good demand at $6; valley, $4; Romans, $3. The tulips have slackened up a little, and sell at $4 for the very best. Harrisii are not quite so plentiful as they have been, and bring $12.50; callas, $10.

Violets, which have been a glut for the past few weeks, are selling better, and Californias are again selling at 50 and 75 cents; double, same price; small single, home grown, 20 cents; southern, 10 cents. There is some very fine mignonette sent to the market, grown by Andrew Meyer, all of the giant varieties. The fine spikes of these flowers are in good demand at from $3 to $4. Asparagus is in fair demand. Smilax is selling better at $10, and adiantum sells at $1 to $1.25.

Carnation Meeting of Florist Club.

The next meeting of the Florists' Club will be a notable one, from the fact that it will be the annual carnation meeting, and all the new varieties that are being grown are expected to be on exhibition, from all the eastern and home growers. This attraction should draw a gathering worthy of the occasion, and as all florists in town and vicinity are invited, we expect the largest meeting in the history of the club. The date of the next meeting is Thursday, March 10, at 2 p. m., in Hall No. 2, Odd Fellows' Building. Outsiders should not wait for an invitation, but just come and show themselves, and we will make it pleasant for them.

Various Notes.

George Ostertag has given up his Broadway store, and will hereafter be found at 506 North Grand avenue, at which place his sister Mary is doing business.

Mr. Ed. Buechel, secretary of the Riessen Florist Co., on South Broadway, reports business very good, with lots of decorations on hand.

Max Herzog is sending in some very fine Woottons, Brides and Maids, which sell at sight.

Mr. C. C. Sanders has been requested to read a paper on "Nursery Stock from a Retailer's Standpoint" at the next meeting of the club.

Mr. Emil Schray, chairman of the committee on premiums and awards, has appointed his committee, as follows: Messrs. Andrew Meyer, Sr., Albert E. Michel and Henry Ostertag. They have been at work on the prelim-

inary list, which will be out by next meeting .

Mr. W. C. Young's committee on special prizes consists of Messrs. Fred C. Weber, Ed. Buechel, Robert Ayers and Albert Bauer.

If some of our St. Louis florists, who are always absent from the social gatherings or meetings of the club, will read in last week's issue of The Review the Notes of "E," of Toronto, and if the cap fits, as he says, we would like to see them mend their ways in the future and take his advice.

Visitors in town last week were Mr. George M. Kellogg, of Pleasant Hill, Mo.; Mr. L. Bauman, with Frank Netchert, of Chicago, Ill., and B. Kuppers, representing William Hagemann, Philadelphia, Pa.

Mr. Dykes is in town, representing Ed. Jansen, of New York.

Bowling Items.

The Bowling Club had a good attendance Monday night, and some very good scores were made. Mr. Kuppers, of Philadelphia, was a visitor at the alleys and rolled with the boys. The best three games were rolled by Beneke, with 617, highest single score 222; E. Schray, second, with 563, high single score 223; John W. Kunz, third, with 510, high single score 200.

I see by the Omaha notes that the members of the Nebraska Florists' Society have the bowling fever and meet every Monday night. Keep it up, boys; we will be with you next August.

J. J. B.

PHILADELPHIA.

Business Brisk.

Business continues brisk, with prices about the same as a week ago. Roses were quite scarce toward the end of the week just closed, the Second Assembly ball and the dinners which preceded causing a brisk demand on Friday. Daffodils were also freely used on this occasion. Carnations are barely holding their own, due partly to the quality of the stock, which has fallen off a little. Tulips are good and selling freely. Double daffodils were overdone in the early part of the week. Ferns in 3-inch pots are scarce.

Germantown Hort. Society.

The February meeting of the Germantown Horticultural Society, held on Monday evening of last week, was a most successful affair. The display, chiefly of orchids, was more than usually brilliant. The exhibitors in this class were two vice-presidents, Albert Woltemate and Roberts Le Boutillier, and both deserved great credit for their displays. The junior vice-president, Mr. Le Boutillier, showed a 12-inch pan of Coelogyne cristata, with fifty perfect blooms. This piece contained six cuttings of five years ago. Mr Le Boutillier feels such confidence in this variety that he offered to put up a quantity of glass for its cultivation if any retailer would agree to take all the first-class blooms at ten cents each. Among the other varieties shown were Cymbidium Lowianum, unusual; Oncidium Cavendishii, Dendrobium nobile, Wardianum and densiflorum, Lycaste Skinnerii and Brassavola glauca. Besides orchids, water lilies were discussed, the members being reinforced by a stranger from Kew, who spoke right out in meeting and was cordially welcomed.

Penn. Hort. Society.

The following night (Tuesday) the Pennsylvania Horticultural Society met, and again orchids were the center of attraction, H. T. Clinkaberry, gardener to C. E. Roebling, of Trenton, N. J., and Alphonse Pericat, gardener to Mrs. George B. Wilson, of West Philadelphia, being the exhibitors.

The members of the society invited the City Parks Association and the Civic Club to join them in listening to an illustrated lecture by Jacob A. Riis, of New York, on "The Children of the Poor and the Need of Play Grounds and Open Spaces for Recreation." Mr. Riis' lecture was well attended and proved most interesting. He showed the poor little chaps of New York, living in dirt and filth, and traced their development into the criminals of the slum districts, by means of slides. His idea being that crime can be lessened by surrounding the crowded tenement districts with open squares and play grounds, where the children can have their amusements and plenty of fresh air.

Friday evening witnessed the meeting of the Botanical Club at the University, which Dr. McFarland has brought into flourishing condition with a membership of 125, and also the second assembly, a most brilliant affair, which brings sadness to the heart of the florist, for it means Lent is near.

The Lily Disease.

And now I want to speak of the lily disease, which has assumed such alarming proportions here. The Florists' Club has wisely set apart a meeting in April for the discussion of this vital subject. Briefly, the case stands thus: The florist buys his lily bulbs from the seedsman, who agrees to furnish sound bulbs of a certain size. These conditions are fulfilled as far as outward appearances go, but when started, very many of these bulbs develop unmistakable signs of disease; some fail to develop at all. I know of one grower who lost three-quarters of his L. Harrisii; another one lost three-quarters of his L. longiflorum.

The florist goes to the seedsman, who expresses deep regret, says the trouble was probably aggravated by the effort made to get the bulbs into this country before the tariff bill went into operation, July 24, 1897, and if the case be a very bad one, delicately hints that Mr. So-and-So has had pretty good luck with the bulbs sent him, thus making the florist feel he isn't much of a grower. When the question of payment is broached, the seedsman becomes inexorable. The Bermuda growers allow no rebate and he can allow none. In vain the florist urges his loss of bulbs, to say nothing of time and space. He is morally right but legally wrong, and must yield.

Mr. Buettner proposes a government inspector, to prevent all diseased stock from entering this country. I doubt whether this plan would solve the problem so far as lilies are concerned. Would not a better plan in this particular case be for each florist to insist when ordering his lilies, be they Harrisii or longiflorum, on a written guarantee, that they be free from disease? This plan, generally adopted, would send the seedsmen to the Bermuda growers with a similar contract, which the latter must submit to or keep their bulbs. The result would be either that the disease would be kept within bounds or that lily growing would be abandoned in Bermuda. In either case the present unsatisfactory conditions would cease. This emergency demands resolute action. Any florist who orders his bulbs in the old way, without a positive written guarantee that the stock supplied be free from disease, will be guilty of extreme folly.

Notes.

Ladies' night at the Florists' Club on the evening of Washington's birthday was a great success.

William P. Craig has been elected vice-president of the American Carnation Society.

Our bowlers won fresh laurels by defeating the strong Irving team by 50 pins in a league match. J. W. Y.

CINCINNATI.

Review of Market.

The commission men have been kept busy for several days hustling for flowers to fill their many orders. They all report a good out-of-town trade, or, rather, demand, as many of the orders could not be filled at any price. The market opened up Monday in the same manner, and I am safe in saying this will be a repetition of last week. There is nothing much going on in the way of society events, but trade among the retail men is fair and steady, which beats one good day and four or five bad ones.

Wholesale Prices.

Brides and Maids are hard to get, and find a ready sale at $8 per 100; Perles are held at $5; Meteors, $8 to $10. Beauties cannot be quoted, as there are no first-class ones in the market, and buyers have long since ceased to ask for them. Carnations have either stopped blooming with some of our growers or else are being sent to some other market—I will take a trip around and let you know which

a little later. The few coming in find a ready sale at $1.50 to $2 for ordinaries, and $3 to $4 for fancies. Bulbous stock is held at the following prices: Romans, $2 to $3; valley, $3 to $4; daffodils, $3 to $4; tulips, $4; callas, $8 to $10, and Harrisii, $12.50. Violets seem to be the only flowers that are not "in it," as they are going slow—anywhere from 50 cents to $1 per 100.

Our old friend, M. Rice, of Philadelphia, was a recent caller. B.

NEW YORK.

In the Flower Pit.

Last week was not one of surprises in any line. It rained Saturday, which was not a surprise, either, as it has rained now for eight consecutive Saturdays, much to the chagrin of the "craftsmen" on the street. A good, bright Saturday is always hoped and earnestly prayed for — if wholesalers were ever known to pray, and I have it on good authority they do, sometimes. "It clears up the icebox ready for Monday," said one man; "that is, a good Saturday, and we do not have to carry any goods over."

The crop of roses is falling off slowly, before the final spurt for Easter, which is getting very, very near. Prices remain, though, about the same as last week. The best Beauties realize 75 cents apiece, while Bridesmaids, extra selected stock, command $15 per 100; Brides, a little less, $12, and they are not quite so plentiful as Maids. Fancy Meteors sell for $12 and a few very choice touch the $15 mark. This, however, is exceptional. Morgans and Cusins sell equally well, though there are not many of the latter grown in proportion, and $8 is the top notch for these. The Perle sells in limited quantity, while Sunset is scarcely seen any more and rarely realizes more than $4 per 100 at the best.

Valley was a shade better this week; that is, there was not the quantity to be had; price ruled about the same, though extra graded stock sold a trifle higher. This commodity has suffered very much this winter. There is a plethora of bulb stuff of all grades, tulips selling about as well as anything, while Harrisii was hammered down to $5 per 100. Smilax—that is, good smilax—sold as high as $15. and poor as low as $6.

The demand for orchid flowers is jerky and erratic. There are not so many cattleyas as heretofore, but the demand is light; retailers do not seem to like to invest in this stock unless for orders. Quite a number of the Dendrobium Phalaenopsis are seen and realize 25 cents a flower. It is one of the prettiest and most graceful of the Dendrobes.

I spoke just now of the retailer investing. The retailer invests very little in flowers; that is to say, he lays in no specially large stock. He does not speculate. The telephone, the galaxy of wagons used on any possible occasion, and the "flower buyer," all militate against this. The majority of the large florists are nearly all located about and around the wholesale district, and if a rush order comes for anything special, the "buyer" and the telephone are immediately brought into play.

One large retailer keeps his buyer almost the day long among the wholesale houses and directly in touch with the "home office." He knows immediately where to lay his hands on 1,000 Bridesmaids or 100 cattleyas, as the case may be, and so it is, the icebox contains just samples, so to speak, and the "hand-to-mouth" system is thus carried on; so the wholesaler does not know from one minute to the other when his stock may be decreased. Of course, in the early hours the big buying is done, but it usually covers the whole day, more or less, according to the demand.

This has a tendency to "bear" prices, it seems to me, for it is always problematic what the day will bring forth.

Lent is right at our door, but this is only a temporary check, now, lasting about two weeks, after wh'ch things again commence to find their level. Taken as a whole, though, trade has been fair. At no time can it be recorded, however, that stock has been scarce, except about three weeks ago, and that lasted but a few days. Are the growers satisfied? We take it some are not, for they are continually changing their wholesaler, only to go back at some future date to their "old love," with burnt fingers and a mental resolve that they will not leave him again. "What, never? Well, hardly ever."

The Club Dinner.

The event of the year, the dinner of the New York Florists, takes place at the "Arena" next Saturday, the 26th, and the banquet hall is expected to be filled. Many gentlemen from out of town, besides the members, are expected to be present. Mr. Patrick O'Mara, of toastmaster fame, will assume the honors on this occasion, and a very successful and enjoyable evening is anticipated.

The decorations will be in charge of Mr. Lawrence Hafner and contributions should be sent to the secretary, Mr. John Young, as early as possible Saturday morning. The hall will not hold more than seventy, so intending subscribers should send in their applications immediately.

The Retail Trade.

I scoured the town the other day for a few novelties, but did not meet with much success. Violets in pots are selling very well and are quite pretty. Genistas are to be seen in several stores and remind us that spring and Easter are not far away; also such forced shrubs as forsythias, spiraeas, almonds, etc.

Big events there are none and but a few ordinary social functions, and by the by, a "vegetable dance" last week where folks were supposed to go garbed as "garden truck" (immensely elevating, I should think). However, I hear the ladies appeared as roses, paeonies, pansies, carnations, etc., while the men wore headgear of cabbages (very appropriate), pumpkins, etc.

The Donohoe-Ehret wedding was quite a brilliant affair and was handled by Hanft Bros. Bridesmaid roses, lily of valley and cattleyas were used very extensively. It was a house decoration, and a short description would not go amiss. The altar was an Egyptian canopy nine feet high, composed entirely of valley and bridesmaid roses, from which hung a bell composed of the same. From the top of the canopy to the walls of the room garlands of asparagus, roses and valley gave it a light and pretty finish. Banked on either side were azaleas and white lilac, and at the base were boxes of red and white tulips. On either side were two immense baskets on standards of pink roses and valley with streamers of the same. The mantel and mirror were tastefully decorated with cattleya, the outline of a star being designed in cattleyas hung on the face of the mirror, the reflection caused thereby making an exceedingly pretty effect, and garnished here and there with sprays of Asparagus Sprengerii and plumosus.

In the library there was a bank of genistas and Marguerites and on the mirror in this room was a circle of cattleyas. In the banquet room Valley and Bridesmaids predominated. Azaleas in flower and graceful palms did duty here and there, but space will not allow me to go into further detail. Enough to say that the whole arrangement was pretty, light and graceful, and a credit to the decorators.

Seed and Bulb Trade.

A large wholesale man told me today he had received information that a syndicate had been formed in Holland by some of the largest dealers to raise the price on hyacinths and tulips 20 per cent, and had held out special inducements to growers to sell to them. It is not likely, though, that it will prove a successful combination, as several large handlers of bulbs have refused to enter the combine's ranks. As flowers in this line are selling today, it would be far more desirable to reduce the price 20 per cent if they expect to secure any orders in this vicinity.

The spring bulb trade is opening up pretty well. Tuberoses, however, are moving somewhat slowly. Japan bulbs are selling better and there have been several calls from Europe for large sizes. The demand for begonias and gloxinias increases every year and

importations are larger. The crop of Caladium esculentum is heavy, and calls for the larger sizes increase; these will sell better later. Cannas are offered in large quantities and at low prices, which will stiffen as the season advances.

Our Special Wholesale Report.

Business, though not brisk, showed a slight improvement over last week.

Roses and carnations moved better than other stock. There was an ample supply of everything during the early part of the week, but towards the latter end roses again shortened up. Brides, Bridesmaid and the other varieties of small roses found a ready market, but beyond a steadying of price there was no advance. There is no surplus of good Beauties. Shipments are yet light, which sustain the price. Meteor has sold better and the average price will compare favorably with last week's quotations.

Bulbs are more plentiful than ever, with little hope of any immediate improvement in prices. Tulips of fine quality are bringing very poor figures, and this may also be said of Harrisii, which are arriving in increased quantity.

St. Valentine's Day was disappointing in its results to the violet growers, who had evidently made preparations for a big business. The shipments were of Easter proportions, but the weather was bad and no doubt shut off a demand that might otherwise have consumed much of the choice stock. As it was, it took the better part of the week to catch up with the shipments of the days following. Average price is rather less this week.

Valley and hyacinths were cleaned up in fair shape at current figures. Smilax is selling well.

Various Notes.

Mr. Alfred Dimmock, representing F. Sander & Co., St. Albans, England, will arrive next Saturday per S. S. Umbria.

The first auction sale of the season will be held by J. P. Cleary & Co., at their salesrooms on Vesey street, March 8, and Mr. John will again wield the hammer.

Messrs. Clacas & Boddington have been appointed the sole American agents for the "Union Horticole," France, large handlers of all French products in the bulb and plant line.

Mr. E. Koffman, of Walden, was in town to-day. He expected a consignment of Cypripedium insigne on the Spanish warship Vizcaya, but the frosty reception the boat received killed them all. O lachrymae! O Koffman!

Mr. Chas. R. Christy, of Glenbrook, Conn., is sending in some specially fine roses to Mr. John Young. I noted some Bridesmaids with stems fully three feet, large blooms of excellent color and size. His Brides, too, would do justice to any grower.

Traendley & Schenck are handling a line of good all-round stock, including Lager & Hurrell's cattleyas, fine forms, large flowers and good color, that sell readily, one firm, I believe, taking nearly the whole product.

Mr. Fred Smythe left for Trinidad last Wednesday, per steamship Grenada, on a business trip for Siebrecht & Son, where he will inspect the stock at their nurseries, palms, dracaenas and other plants being grown there quite extensively by this enterprising house for importing and growing on.

BUFFALO.

The writer has been away the greater part of the week, and consequently has missed the local news. Business is reported as only fair, and the weather has kept up its record, for no two days have been alike. If there were any visitors in town we missed them, and if they were not of the right sort, no regrets.

Mr. William J. Palmer, the elder, Mr. D. B. Long and William Scott started for Chicago on Wednesday, and had a very pleasant journey to the great city, as they were joined by the Cleveland delegation when a few hours on their journey. The anecdotes of Mr. Graham and refreshments of Mr. Hart kept us all awake till a late hour.

It was a great show, and we are the better for seeing it and seeing our fellow craftsmen. The two oldest of the party arrived home Sunday morning. That I can swear to. But what became of D. B. Long and all our Cleveland friends? We don't know.

There was a small but earnest meeting of the Florists' club held at the home of W. S. last week. Our annual banquet is a certainty, and a full exhibition is a probability, which will be decided on one way or the other shortly. W. S.

TORONTO.

Trade Conditions.

The typical bright, crisp, frosty, Canadian winter has gone back on us this year and a day's sunshine has been a rare occurrence since last November, in consequence of which the growers hereabouts have not been able to fill all the orders of their regular customers. Just now we are being treated to the biggest snowstorm of the season, and the inside of a greenhouse is a dull and dreary place. It is to be sincerely hoped that the coming season of Lent may be enlivened by the sun a little more, so that there may be good stocks by Easter time. The plant trade, however, has been picking up a little, and there has been a fairly good trade done in palms, azaleas, ferns and pot bulbous plants.

Gardeners' and Florists' Association.

The regular meeting of the Gardeners' and Florists' Association last Tuesday was sparsely attended, owing to bad weather. However, there was a quorum, and a good deal of business was done. Henceforth the annual fee will be $1.00; new members will pay $1.00 entrance fee at time of nomination, as will also old members who have fallen into arrears. B.

CHICAGO.

The Market.

Continued dull and cloudy weather has shortened up stock considerably. Particularly is this true regarding carnations, for which there is an unusually lively demand, especially for the fancy grades, such varieties as extra Jubilee and Flora Hill selling at $5.00 per hundred, it being an easy matter to dispose of all that can be had at that figure. It would seem that the Carnation Meeting had stimulated the demand for extra choice stock. Fine Daybreaks are held at $3.00, with ordinary stock ranging from $1.50 to $2.50.

In roses the demand is likewise brisk, with good stock correspondingly scarce. Choice Brides, Maids and Meteors are readily disposed of at 9 cents. Beauties remain scarce, with not enough to supply the demand, many orders having to go by default.

There is an increased call for Harrisii, a great many being used at the funeral of Miss Frances Willard. Bulbous stuff continues in slow demand, with the exception of tulips and valley.

Prices on most lines have stiffened up perceptibly, due to Washington's birthday, but a drop of a point or two is almost inevitable, on account of the nearness of Lent, during which period many less flowers are used.

A Visit to Hinsdale.

A party of fifty-two of the visiting florists paid a visit to the establishment of Bassett & Washburn, Hinsdale, Ill., during the convention, and found everything in the usual fine condition. Mr. Washburn entertained President-Elect Nicholson and party at a dinner at Kinsley's.

PITTSBURG.

The retail trade of the past week in cut flowers has been particularly good. While the coming Lenten season will be characterized by the usual falling off in trade, there are a number of banquets, club affairs and some weddings that will swell the volume of business.

Pittsburg was represented at the American Carnation Society convention by Messrs. Fred Burki and Benj. L. Elliott, of Elliott & Ulam. Both gentlemen report that the convention was an unqualified success. It was particularly noticed, and with pleasure, that the growers are succeeding in promoting stronger stem in the newer varieties.

Among the visitors in town were Messrs. P. Vos, of the Holland Bulb Company, and Martin Reukauf, repre-

senting H. Bayersdorfer & Co., Philadelphia, Pa.

Mr. Robert Faulk, with Hartman Bros., has left for a trip south. His destination is New Orleans. L.

COPYRIGHT 1898.

OBITUARY.

W. P. Simmons.

W. P. Simmons, of the well-known firm of W. P. Simmons & Co., Geneva, Ohio, died Feb. 9 of kidney and heart trouble, aged 81 years. He had been a resident of Geneva for thirty-one years. He was one of the most successful florists in the country, and was widely known through the many valuable carnations, geraniums, etc., introduced by the firm of which he was the head. Mr. Simmons was born in England, and was gardener at Eaton Hall before coming to America.

WASHINGTON.

Trade conditions remain the same as last week, stores continuing busy with small work, principally in bulbous stuff.

The Gude Bros. are the largest growers of bulbs this season, and are sending in quantities, all well grown. Their show window last week was filled with La Reine tulips and Harrisii lilies.

Prices are about the same as last week; quantity and quality of stuff better; violets not as plentiful and price firm. W. H. K.

MILWAUKEE.

Another blizzard struck the town, and before it got through raging we were almost snowed under. All trains were running behind time and out-of-town shipments arrived very irregularly. Down-town trade was somewhat affected, as street car service was bad and traffic almost entirely suspended for some time. Stock, however, remains scarce, so what demand there is easily consumes the supply.

Nic Zweifel and Otto Sylvester attended the meeting of the Carnation Society.

E. Haentze, of Fond du Lac, was a caller, on his way home from Chicago.

GEO. WASHINGTON.

HUNT'S REVIEW OF THE CHICAGO MARKET.

The past week has been one continual round not of pleasure but of hustle to get enough stock to fill orders.

Probably every wholesaler has seen times during the week when his best customers have had to be disappointed, times when neither love nor money would get the flowers wanted in time to ship when needed.

And this has been unavoidable, too—no amount of foresight or wise precaution could produce roses and carnations out of the air.

While we mention it, that is just where all the trouble comes in—the air. Foggy—damp penetrating, "Grip" producing air is hardly what one would choose as a flower producer, that's what we've had now for three weeks, and is still with us.

Roses, at writing, are more plentiful and rule in price perhaps a trifle easier, but the advent of Lent has more to do with that than any increase of bloom.

Carnations, on the contrary are scarcer than at any time this winter and for that matter than at any time in four years. This is not guess work, but actual fact, computed from records of several houses and testimony of various growers who know whereof they speak.

Violets have been fairly plentiful and so has about everything else worth mentioning; bulb stuff particularly easy to get, and all of good quality.

No one knows what is in store for coming week and few dare to guess—we do not—Selah!

WANT ADVERTISEMENTS.

SITUATION WANTED—As foreman in good florist establishment. First-class rose grower, also palms, ferns, carnations, mums, violets and general stock. Or take charge of a gentleman's good private place, 20 years experience in England and America. Strictly temperate. Good wages expected. Married. Disengaged about March 1st. Good references. Address Geo. Norton, 164 Center St., Bridgeport, Conn.

SITUATION WANTED- Near Chicago, by first-class grower of cut flowers and plants, also mushrooms and cucumbers. Was in charge of last place for six years. Good references. Parties wanting a good all round man please address F. G., care of Florists' Review.

SITUATION WANTED- A young man of 19, with three years experience in florist store, desires a place in greenhouses to learn practical floriculture. Albert Fiedler, 820 Hanover Street, Baltimore, Md.

SITUATION WANTED—Gardener, single; in private place, understands care greenhouses, fruits, vegetables, lawns and everything in general; Best of references. Address W., Florists' Review, 56 Pierce Bldg., New York City.

FOR SALE—Large cypress tank holder; ten thousand gallons of water; good as new, as it has been indoors and well painted; only in use 5 years; price, $75.00, f. o. b., Cincinnati. J. A. Peterson, 105 East 4th St., Cincinnati, Ohio.

WANTED, SITUATION—By a florist of 20 years' experience as maker up of designs or general greenhouse work; very best of recomendations. Joe. N. Lawrence, Ottumwa, Ia.

WANTED—An all round man capable of running private greenhouse; one who understands growing carnations and roses. Must be a willing worker and strictly temperate; a permanent place. State wages and give references; a young single man preferred. Dr. S. A. Richmond, Tuscola, Douglas Co., Ill.

SITUATION WANTED—By florist-gardener; private or commercial; fifteen years' experience in all branches; first class references. Address J. M. W., Lansdale, P. O., Pa.

WANTED—A first-class grower who knows enough to run a place on business principles, to buy one-half interest and take full charge; must thoroughly understand the business. If dissatisfied with his purchase any time within one year he can have his money back. For particulars address A. H., care Florists' Review.

WANTED—California and Russian Violet runners in exchange for 1000 American Beauty rooted cuttings. K. K., Florists' Review.

SITUATION WANTED—By single man, four years experience in commercial greenhouses; age 25; salary no object. Address B. T., care Florists' Review.

WANTED—Single man for general greenhouse work. Address, stating wages desired, etc., Huntsman Co., Cincinnati, O.

SITUATION WANTED—By practical florist and gardener, private or commercial, as foreman, A 1 on roses, carnations, mums, violets, etc.; 15 years' experience in this country; English; married; no one horse affair need answer this; state wages, best of references. Address B. N., care Florists' Review.

WANTED—Foreman, on commercial place, California. Must be experienced in handling men, with unquestionable knowledge of propagating and growing, both inside and out; competent to take entire charge; good habits and best of references. Address "Carnation," care of Florists' Review.

FOR SALE—Range of greenhouses, and land for rent. Address John Leluan, West Foster avenue, Station X, Chicago.

SITUATION WANTED—By a first-class florist, 12 years experience in growing cut flowers and general bedding plants; age 28; single. Address Florist 100, care Florists' Review.

FOR SALE OR RENT—New house, with large barn and carriage house; poultry pen, good lawn, one and one-half acres of planting land; good water and other essential appliances which make it a desirable residence and florist business; situated one-half mile from Asbury Park Depot, New York line; rent, $250 per year, with option of a 5-year lease. Address Owner, care Florists' Review.

FLORISTS' REVIEW.

THE GOVERNMENT SEED SHOP.

The January issue of Agricultural Advertising, Chicago, is largely devoted to the seed and nursery trades, and much space is devoted to an expose of the government seed shop humbug. There are numerous expressions of opinion by seedsmen and others, including one from Mr. James Sproule, manager of the Sunset Seed & Plant Co., of San Francisco, in which appears the following paragraph:

When the time comes that the seed trade of the United States will take the position that whether or not the Government persists in free seed distribution, they will none of them directly or indirectly, supply the seed on any terms, then will the United States Government, if it chooses, become a depot for the free distribution of foreign seeds and thus repudiate its own patriotism. This latter plan is in our judgment, the only available scheme of annulment of the United States Government's action. The other plans are, in our opinion, claptrap or political, or both.

AN ORCHID FARM.

Under the above title Country Life Illustrated, of London, Eng., prints a handsomely illustrated description of the establishment of Sander & Co., at St. Albans. The half-tone engravings are remarkably well done, and reflect the greatest credit on the publication named.

LEAVENWORTH, KANS. — The greenhouses of Kirkpatrick Bros. were badly damaged by fire Feb. 9. The loss on contents was almost total, the fire having completely destroyed the boiler house and burned away the ends of the connecting greenhouses.

The Right Cypress for Greenhouse Material.

Have you heard of Cypress Greenhouse Material that has not been satisfactory? If you have it does not follow that Cypress is not the best lumber to use. There is White Cypress, Yellow Cypress and Red Cypress; there is Cypress that grows on the high lands and Cypress that grows in the swamps.

All of these different kinds are not suitable for greenhouse purposes. Do you know which kind is best and do you know that kind when you see it? If not you would better buy from those that do know and will deliver exactly what they sell. We introduced Cypress for greenhouse construction and pushed it to the front. We know all about it. For fifteen years we have made a specialty of furnishing it, and during this time we have built up a reputation that we can not afford to jeopardize. We send out the best only.

SAN FRANCISCO.

California Grown Harrisii.

On a visit to Messrs. Grallert & Co., at Colma, I found they were trying California grown bulbs of Lilium Harrisii and L. longiflorum, and they compared very favorably with Bermuda grown stock, particularly the longiflorum. They were grown near Los Angeles.

Mr. Grallert's specialty is carnations, and the most profitable variety with him is Eldorado. Magnet, Minnie Cook and Princess Bonnie are also largely grown. All the novelties of 1897 are on trial, but with the exception of Flora Hill only a few will be retained.

Roses and Carnations at Burlingame.

The establishment of Mr. E. W. McLellan, at Burlingame, is the best appointed and most modern place around San Francisco. He is strong on roses, Bridesmaid, Bride, Meteor, American Beauty and Perle being extensively grown. Carnot is on trial, but though doing fairly well, Mr. McLellan questions whether it will pay to grow it for the San Francisco market. In carnations Portia, Scott and Eldorado are considered the most profitable. Of the new varieties, Flora Hill, Mayor Pingree, and Victor will be planted in increased numbers next season.

The scenery between Burlingame and Menlo Park is very picturesque. On one side is San Francisco Bay, and on the other rising ground with here and there beautiful villas, parks, fields of grain and immense vegetable gardens, some reaching up into the mountains. The various colors of the vegetables give in the distance the effect of an immense parterre of carpet beds.

At Menlo Park.

Menlo Park is a park indeed, the streets and grounds being overgrown by immense live oaks. Here Mr. Sidney Clack leases from the Sunset Seed & Plant Co. their cut flower houses, they retaining the plant houses, which are filled with palms, ferns and decorative plants.

With Mr. Clack carnations are the money makers, and Portia seems to head the list, closely followed by Uncle John. Mr. Clack believes the latter variety rivals the former in number of flowers cut. In roses he grows Beauty, Bride, Maid, Meteor and Perle. But as regards Perle he complains that it does not go well in the San Francisco market.

At Mr. M. Lynch's I saw roses doing grandly in solid beds, the soil being on about a level with that outside, looking as though the beds had simply had a glass house placed over them. Quality and quantity are surely combined in the product of these houses and there must be a great saving in labor. Solid beds for Brides and Maids are evidently the correct thing here though I was shown bench houses in good condition.

Portia is the leader in carnations here and Scott is also grown. In new carnations, Mr. Kenneth Murray, the able grower here, is much impressed with Flora Hill and will grow it largely.

Carnations of California Origin.

Nearer the city I called on Schwerin Bros. They have about 2,000 plants of the set of 50 California carnations that originated with Mr. John H. Sievers. These were sold by Mr. Sievers for planting out in the garden only, but many have been very useful as cut flower producers. The blooms are fancy and Schwerin Bros. have found them very profitable. They intend to plant 6,000 plants of varieties selected from this set. Evidently Mr. Sievers placed a too modest estimate upon the value of his new varieties, or it may be he has some better ones on the way.

MAIL ADDRESSES.

You will doubtless confer a favor on all your advertisers if you will write and publish an article on the importance of plain writing and full postoffice addresses.

This morning we received a postal card that is anything but plain. We can only guess at the signature. After a good deal of studying we concluded that its heading was Warsaw. The state not being written, we turned the card over to find it in the postmark, but the postmark reads, "Pittsburgh and Chicago P. O.," indicating that the card was mailed on train in one of four states: Illinois, Indiana, Ohio or Pennsylvania. We turned to one state after another in a national directory and found that each one of these states has a Warsaw. We have written a postal card to each one of them, and if we have properly guessed the name we will probably get another communication giving the full address that we requested.

(The above communication seems to cover in itself the point it is desired to emphasize. Every business house has an unpleasantly large number of similarly imperfect names and addresses to decipher. Often it is impossible to reach the writers, and the recipient is condemned for not answering, when an answer would have been immediately forthcoming had the name and address been decipherable.—Ed.)

HEN MANURE.

I have three or four barrels of fresh hen manure and would like to know how to use it in feeding plants in the greenhouse. Will it be safe to use it on carnations? How much shall I use to a barrel of 50 gallons of water? Please give me full instructions.

W. J. M.

Don't attempt to use the hen manure except as a liquid. If you do use it otherwise it should be mixed with earth for some time first, and then in making a compost one-twentieth of the manure is enough. One gallon of the manure to 50 gallons of water will make a strong solution. Better be on the safe side and apply to the bench not oftener than once in two weeks. WM. SCOTT.

SWEETPEA REVIEW.

The Sunset Seed and Plant Co., San Francisco, has published a third edition of their "Sweet Pea Review," and a copy is at hand. This is certainly a very useful little handbook of the sweet pea and we are pleased to see the publishers are keeping it thoroughly up to date. No one interested in sweet peas can afford to be without it. In no other publication that we know anything about is there given so much really useful information about this popular flower.

GOVERNMENT COMPETITION.

The Cleveland Florists' Club has adopted the following vigorous resolutions, and some similar action should be taken by every trade organization in the United States:

Whereas, The practice of distributing plants and cut flowers, grown at the public expense has become so general as to amount to an abuse of the public money, paid in part by the florists of the country at large, thereby giving them a direct and personal interest in such abuse of the functions of government; and,

Whereas, The said distribution works a direct and serious injury to the florists and gardeners of the city of Washington, D. C., by bringing the servants of the government, maintained at the public expense, in the direct competition with the said florists of Washington, to the detriment of their business; be it hereby

Resolved, By the members of the Cleveland Florists' Club, that the members of the craft in Washington are entitled to the earnest sympathy and support of florists throughout the country, in their fight to overcome this abuse, and that the said Cleveland Florists' Club hereby protests against the misuse of public funds and facilities for the production of plants and flowers for gratuitous distribution in competition with legitimate trades of any description, and the secretary is hereby directed and authorized to forward copies of these resolutions to the Congressmen of this district, and to the Senators from Ohio, and also the trade papers, and to the Commercial Florists' Association of Washington, D. C.

Adopted Jan. 24, 1898.

Florists' Review....

LOS ANGELES, CAL.

The unusually cold weather for southern California the last two months, has made a shortage in cut flowers. Even carnations, for which this section is becoming so noted, have not met the demand.

The Redondo growers are about, if not the only ones, that have not suffered from the frost. They have some thirty acres planted to carnations. Mr. Feder is cutting from 2,500 to 3,000 per week, and the Redondo Beach Co. about the same. While they are not cutting nearly so many as they would if the weather was more favorable, yet the quality does not seem to be affected, as they have as fine blooms as one could find.

J. J. Dean, of Moneta, in the valley between Redondo and Los Angeles, would have lost a good deal if he had not had his young stock under glass. The frost ruined his outdoor stock for cut flowers. Capt. Gray, of the Ingleside Nursery, Alhambra, suffered about as badly. What carnations he is cutting, he has under glass.

We think the palm will have to be awarded to the Redondo growers, both as to quality and quantity. M.

SIMMONS'

New Light Colored

CARNATION

Mrs. S. A. Northway

We introduce this variety with even more confidence than we did Portia, Silver Spray, Tidal Wave, Daybreak, Rose Queen, or J. J. Harrison, knowing that it will become as great a cut flower variety as any of the above. Plant of strong, free growing habit, entirely free from disease or rust; large round high built flower with perfect calyx and extra strong and long stem. Color a beautiful soft shell pink becoming almost white when fully open.

Orders booked now and filled in rotation. We shall commence to ship soon after Jan'y 1st. Price, $10.00 per 100; $75.00 per 1000.

Geraniums. Md. Bruant, Md. Jaulen, Fleure Poitevine, J. Ricaud, and J. Sallier, 2¼-in. pot plants, $5.00 per 100. Rooted cuttings, $3.00 per 100; $25.00 per 1000. Our superb stock of all the finest sorts, 2¼-in. pot plants, named, $25.00; unnamed, $20.00 per 1000. Rooted cuttings, $12.50 per 1000.

Fuchsias. A grand lot of summered-over stock in small pots that will make early bloomers, $3.00 per 100.

All Rooted Cuttings Cash with Order.
Our Price List describes many other fine plants. Send for it.

W. P. SIMMONS & CO., - Geneva, Ohio.

Carnation Victor.

Undoubtedly the best Pink Carnation in commerce and certainly the most prolific bloomer, perfectly healthy and of vigorous growth.

Rooted cuttings now ready, $4.00 per 100; $35.00 per 1000. Come and see this Carnation growing.

Chrysanthemum Pennsylvania.

The finest yellow for cut blooms or exhibition purposes ever produced. Plants ready March 15, $5.00 per doz.; $35.00 per 100; $250.00 per 1000.

HUGH GRAHAM,
104 South 13th Street, Philadelphia.

FIREFLY!

A Rust-Proof Carnation for Business.

Bright scarlet and Positively RUST PROOF and as productive as Scott. Rooted cuttings, Feb. 15th, $10 per 100, $75 per 1000. Send for descriptive list of Firefly and fifteen other novelties of 1898, as well as fifteen varieties of '97; also older standard varieties.

Geo. Hancock & Son, Grand Haven, Mich.

ROCHESTER, N. Y.

Looking in at the establishment of J. B. Keller's Sons, I found the worthy Mr. Keller, senior, busily engaged in tying up a fine specimen of Dendrobium nobile, and it occurred to me that as this house possesses a large stock and had such success with this plant, an article in The Review would be highly appreciated. This was declined, however, on the ground that the herbaceous department required Mr. Keller's sole attention, so he kindly furnished your correspondent with the following particulars:

Dendrobium nobile and its varieties are most easy of propagation, young growths taken off being preferred to divisions. Not less than two, and usually three and four of these rooted growths are put together in a pan. Within the space of two years a strong plant will be obtained, and when producing, say, three flowering and three green growths, it is a pretty and well shaped plant, that will find a ready sale at fair price. Quite a number of plants such as are herein described were disposed of at Christmas, and more were in demand. While these have been grown only with part crocks and part sphagnum, Mr. Keller intends experimenting with Jadoo, having an idea this may be a good thing for free-growing varieties of orchids.

Geo. Savage, of the Kimball greenhouses, has a grand lot of Dendrobes. Wardianum is simply immense. He has a batch of Cypripedium Lawrenceanum and varieties which are the picture of health (this does not insinuate others are not healthy). Even when not in bloom this plant is ornamental, its marbled foliage being very effective. Of insigne varieties Barryanum and Dormanianum are considered the finest, excepting that lovely variety Laura Kimball, for which Mr. Savage has received a number of inquiries, but will have no plants to dispose of for a long time. The first species disposable goes across the pond, and at a big figure. Cypripedium Sallierii Hyeanum is one of the finest of the species. Suspended in the aquatic house are some splendid pieces of Laelia anceps stella and the true alba in flower, truly beautiful and useful; also L. Sanderiana, but I see little difference between this variety and stella.

Angraecums are coming into flower, also phalaenopsis varieties, which latter, to my mind, is one of the most chaste and graceful of the orchid family.

Mr. Savage forces large quantities of Dutch bulbs and many lilacs. The latter are started under the bench and are gradually brought to light with entire success. He has a good bed of violets, but we must give the palm for these to Fred Schlegel's Sons, who have this season the finest lot seen in this section for many years. Freddy is justly elated over their good fortune. W. M.

INDIANAPOLIS.

The Cold Snap.

The cold snap was very severe in this section, the extreme stormy condition making it hard to keep greenhouses warm. Natural gas is now only burned by but few, the gas companies gave notice early in the winter that they would shut the gas off, as their supply was getting too short but to supply only private houses. There is no question but what the natural gas is slowly but surely getting lower each year, especially since the oil companies are letting much gas escape to get at the oil all over the northern part of Indiana and Ohio.

The demand for all stock, while not very brisk is satisfactory. Violets are getting plentiful. Carnations are also coming in lively and of good quality. Roses are somewhat scarce; shipped stock inferior with prices too high for the quality.

SAVANNAH, GA.

Journeying from Charleston to this busy shipping port, upon what is known as the Atlantic Accommodation Express, we stopped at a hustling place named Jacksontown. My attention was arrested by a prominent sign which read thus: "No cursing or blackguarding in this town under penalty of $5." (Fact!) I learned that no member of the craft existed there, so came on to the City of Sabals, where I found A. C. Oelschig, one of the busiest men I have met of late, cleaning up after a big decoration. He grows adiantums in solid beds and lifts them bodily when occasion needs it for decorative purposes. Roses, Pres't Carnot and White La France are grown extensively; this is a rose country.

Geo. Wagner has great success in the raising of narcissus, having a whole field devoted to their culture. He also grows La France largely. W. M.

Two-inch pots $20.00 to $40.00 per 1000.

THE COTTAGE GARDENS, Queens, L. I.

New Pink Carnation **Mrs. Frances Joost**

Seedling from McGowan x Wm. Scott; tested for four years. It is of an exceedingly pleasing color and proved itself an early and most prolific bloomer. It makes in a short time a fine bushy plant, and has the form and habit of what carnation men say make an ideal plant. Positively free from rust. The stem is strong and heavy enough to carry the large flower erect without tying of any sort. Calyx perfect; never bursts. It is a good keeper and a good shipper. You will make no mistake by trying a few. All orders filled in rotation. As the sale of the stock of this Carnation will be limited, it is advisable to order early if you want any. Satisfaction guaranteed.

Price, $2 per doz.; $10 per 100; $75 per 1000.
Cash with Order.

ST. PAUL, MINN.

Trade for the past month has been very encouraging, there being a good demand for all flowers. Stock, however, has been scarce, and more flowers have been shipped than ever before for a like period. The immediate cause for the shortage in the cut is not easy to determine. It certainly cannot be attributed to the weather, for that has been perfect since Christmas. The days have been cloudless, while the thermometer has registered below zero but once in 6 weeks. All the growers had an unusually big cut for Christmas and in the natural order of events should have had another good crop since. While there is a good growth of wood roses are not showing many buds, and carnations seem to stand still. Violets are plentiful and in good demand, the call for California being equal to Marie Louise.

There has not been a big demand for Perles this season. Meteor and Bridesmaid are the best sellers. In carnations Daybreak is a favorite, with many, though Scott and Tidal Wave are in good demand and Jubilee is a favorite with all, not only on account of its color, but also for its immense blooms and good stems.

The outlook for spring trade is encouraging. The open winter has materially decreased the coal bills, while retail trade during the winter would indicate that times are greatly improved. Growers have realized better prices this winter than for several years, while the large quantities of flowers being shipped in from Milwaukee and Chicago would indicate that there are golden opportunities here for good rose and carnation growers. What we need are more specialists.

Carlsen & Lauritsen, who purchased the Warrendale greenhouses last summer, are growing fine roses and violets. They put in a new boiler and a violet house since purchasing the property, besides other needed improvements.

Use Economy and Make Your Own Pots

THE COW MANURE POT is the best in the world for young plants. For bedding and sending of plants it is the best thing ever invented. The cow manure forces the plant and makes it healthier. You do not need to disturb the roots in getting them out as you do in the clay pots. It is especially recommended for the sending of plants, as the plant does not have to be taken out of pot. For bedding all you have to do is to squeeze the bottom of pot and set out in bed. It never stays the plant, it holds the moisture better, especially if you have a dry summer. The pots stand watering in greenhouse and hotbed. Every gardener needs one of these machines. **Single machine, 2-in. pots, $4.50. Double machine, 2 and 3-in. pots, $5.** Machine weighs about 5 pounds.

AN UNPARALLELED SUBSCRIPTION OFFER.

EVERY one to whom this issue of the FLORISTS' REVIEW is addressed, and who fills out, signs and returns the accompanying subscription blank, accompanied by $1.00, within 30 days from date, will receive not only the FLORISTS' REVIEW for one year but also a certificate entitling him to the earnings on one-tenth of a share of stock in the company formed to publish the paper. The shares will be of a par value of $10.00 each.

Why do we make such an unparalleled offer? It is very simple.

You will have an interest in the success of the paper.

You will see that you can buy everything that you want to just as good advantage from advertisers in the FLORISTS' REVIEW as elsewhere and at the same time benefit yourself by increasing the earning power of your certificate.

This mutual arrangement cannot fail to bring to the paper a heavy advertising patronage, and as a result the stock represented by your certificate will earn good dividends.

And the more you buy of advertisers in the FLORISTS' REVIEW (always mentioning the paper) the larger your dividends will be.

You will get a better paper than has yet been published in this field, and a share of its earnings. Please let us hear from you by early mail.

FLORISTS' PUBLISHING COMPANY,

530-535 Caxton Building, - - - CHICAGO, ILL.

Following is the form of certificate we issue to subscribers:

$1.00 $1.00

The Florists' Publishing Company, Chicago.

This Certifies that _____ of _____

_____, is entitled to the annual dividends on one-tenth of a share (par value of each share $10.00) of the stock of the FLORISTS' PUBLISHING COMPANY, of Chicago, Ill., that has been placed in my custody as Trustee, so long only as

_____ shall remain a paying subscriber to the FLORISTS' REVIEW.

This certificate is transferable only to _____ successor in business, and then only on application to the undersigned. Dividends will be made of net profits on the first day of January of each year.

Certificate holders are reminded that by confining their purchases to those who advertise in the FLORISTS' REVIEW (always mentioning the paper when writing) they will greatly enhance the earning power of their certificates.

Buy to best advantage always, but, everything else being equal, give the preference to those who advertise in the paper in which you have an interest.

Witness my hand and seal at Chicago, Ill., this _____ day of _____, 189

(SEAL)

_____,
Trustee.

We Have to Offer at this Time a Large Stock of
Strong Dormant Fieldgrown

CANNAS.

Which we offer at very low prices. The varieties are the very best and finest grown to-day. Florists will find this the most advantageous time to procure stocks and start them for spring sales.

We offer the following sorts at only **$3.00 per hundred,** viz:—
Paul Marquant **Alphonse Bouvier** **Chas. Henderson**
Mme. Crozy

The following sorts at only **$4.00 per hundred,** viz:—
Florence Vaughan **J. D. Cabos** **Austria**
Egandale **Pres. Carnot** **Queen Charlotte**
Admiral Avellan **F. R. Pierson** **J. C. Vaughan**

The following extra choice sorts at **$6.00 per hundred,** viz:—
Eldorado **Chicago** **Pierson's Premier**
Souv. de Antoine Crozy

The following newer and scarcer sorts at **$10.00 per hundred.**
Souv. de Pres. Carnot **Burbank** **Beaute de Poitevine**
Italia **Papa** **Franz Buchner**

We also can supply the following:—
Tuberose Pearl, extra quality.....$1.00 per 100; $7.00 per 1000
Caladium Esculentum,
Bulbs 6-9 in. in circumference.....$3.00 per 100
Bulbs 9-12 in. in circumference..... 6.00 per 100

TERMS: Net 60 days, or 5 per cent discount for cash with order

Pteris Victoriae.

PTERIS VICTORIAE.

This novelty of a few years ago has already become quite a necessity to some of our fern growers, and has been distributed by thousands within the past five or six years.

The variegated ferns available for florists' use are nearly all to be found in the pteris family, and the form in question has proved to be quite an acquisition to the group, at the same time serving to remind us of the wide distribution of the various members of this genus, P. Victoriae having been introduced from the Solomon Islands, while other members of the same family are found in Europe, Asia, Africa, America and Australasia.

Pteris Victoriae is quite a compact growing fern in a small state, the barren fronds being short and spreading, while the fertile ones are much longer and more upright, the pinnae of the latter being quite narrow and contracted in much the same way as those of P. cretica albo-lineata are when fertile.

The fronds of P. Victoriae are much more closely variegated than those of the last named variety, the marking being especially bright and pretty on the fertile fronds, while the whole plant is more attractive, though possibly less vigorous and wiry in constitution. P. Victoriae produces spores in the same profusion that is common to the genus, and their germination is equally free, so that it is by no means difficult to get up a stock.

In potting off the seedlings a better result will be obtained by placing two or three of them together in one pot, thus making bushy little plants that fill up to advantage in a table fernery.

In regard to culture nothing special need be mentioned, for the same conditions that are found suitable for P. serrulata and P. cretica will answer equally well for the species in question.

W. H. TAPLIN.

THE GERMINATION OF CHOICE SMALL SEEDS.

Seed sowing is now an important part of the work of the florist. The methods pursued are various and the results vary as widely as the methods. I recall a case where I had sent each of two neighboring growers a quantity of gloxinia seed, both lots out of the same bottle of seed, and on visiting them later found that one had a box of seedlings in which the little plants were "as thick as the hair on a dog's back," while the box in which the other had made his sowing had produced nothing but green moss. The failure had been due to lack of drainage. It was a forcible illustration of how a seedsman may be condemned when entirely free from blame. In sowing seed the most important thing is to

secure fresh, clean soil free from manure and fungus; the same can be said of sand. See that the pot, pan or flat is clean; every particle of green or dirt should be removed. These should be filled one-half with drainage. Upon this put a layer of moss or rough material to prevent the fine soil from choking it. Fill then to within one inch of the top, pressing the soil firmly and making it level with the aid of a bottom of a pot, watching that a space of about an inch is left between the soil and top. I mention this again, as the reader will readily see in reading this article how imperative this little space is to the well being of the embryo plants. Before filling the utensil the soil must be finely sifted in order that the germinating root will take readily to it.

This being accomplished, immerse them in water until thoroughly soaked, then remove them, allowing time for the water to drain off, and afterwards sow the seeds, exercising care to evenly distribute them over the soil. I have found the following a desirable way to do this. Take a piece of stiff paper, on which put the seeds; by tapping it lightly and tracing evenly over the surface the seeds will fall just where they are most desired. This done, take sand and distribute in the same manner; only a very small quantity must be used. After this, take something with a smooth surface and press down lightly. The seeds and sand will then be firm and will not wash if by chance water is used. In this way the seedlings will not lie down in every direction, but will stand erect; the seed, being firmly wedged in the soil, acts as a support to the plant.

The majority of seeds will germinate in from ten to twenty days, so the strictest attention must be given to avoid the seeds germinating and the plants becoming worthless by being drawn and degenerated from want of fresh air. They should be examined at least once each day.

The seeds being sown as described, the utensils must be carefully covered with glass, keeping close for a few days. This should be covered with moss and moistened, making the space between the top of the pot dark, which will help to develop the seeds in much less time than if exposed to the light and sun. The moss being kept moist will tend to retain the moisture in the soil and save the trouble of watering every day; every morning when looking after them, and if found to be wanting moisture take the glass off carefully and allow the water condensed on it to gradually run off at one corner, moistening the spots that are dry. If this fails to give water enough a sponge can be used better than anything else. Watering in this way will not dislodge the seeds from their positions.

At the first signs of life a little air must be admitted and a small quantity of the moss removed to allow of light, but this should be done very gradually day by day as progress is made in their growth, until the glass along with the moss is entirely removed. The utensils in which seeds are germinated should be put in a light, warm house. This will facilitate their germination to a certain extent and prevent damping off or the development of "web," which is the greatest enemy of all seedlings. Close adherence to these rules will save much unnecessary disappointment and many aching hearts.

Fig. 1.

Green Roses. Four upon the Same Stem.

GREEN ROSES AND OTHER MALFORMED BLOOMS.

The rose, of all flowers, is the most inclined to vary so far from the type as to become a monstrosity. For the present no attempt will be made to account for this. Recently a friend brought the writer a cane of a tender rose, variety not known to him, that exhibited four "green roses" and a photograph has been taken of it, from which the accompanying engraving (Fig. 1) has been made.

In this engraving all the four flowers are nearly equal in size, but the photograph secured only two of them in fair focus. One of the peculiarities of these roses is the form of the petals. Unlike the ordinary ones, these roses have petals that are strongly veined and have the edges strongly saw-toothed. They are of a deep green color, agreeing in this closely with the foliage of the plant. While rose leaves are compound, composed of an odd number of leaflets, the green petals are simple and correspond to the terminal leaflets of ordinary leaflets.

The feature of these green roses and the one that determined the writer to bring the matter to the attention of rose growers was the odor of the green blooms. The fragrance was as delicate as that of the ordinary blossoms and, after being cut and confined in a small space, the four green roses produced as abundant and characteristic odor as could have been expected from an equal number of the best specimens of the sweetest sorts. This fact was a surprise to many who had their attention called to it and the writer would be pleased to learn if this fact usually holds with green roses.

It would seem that in the attempt to revert to leaves, the more superficial characteristics of foliage had been acquired while the deeper one of per-

fume had not been lost in any apparent degree. This is only what might be expected, for the glands to secrete the fragrance have more significance in the rose than mere shape and color.

In the development of floral organs from foliage the bright colors doubtless came before the odor, or in other words, a change of color that is a loss of the floral tint is a less transition than the destruction of the glands that furnish the odor.

Masters, in his Vegetable Teratology, mentions several cases of alterations in roses. One of these is of a case where the sepals become leafy in the ordinary sense that it has the usual compound leaves, the tip or swollen urn shaped cavity is absent and the stem grows for some distance beyond a ring of petals and then bears a supplementary flower. This is the ordinary form of a proliferous rose, that is, one placed above another or in prolongation of the floral axis.

This manner of increase may be carried so far that from the center of a flower, a whole bush, bearing several blooms, may proceed. This is shown in figure 2, redrawn from a cut given by Dr. Masters. The result is quite different from the green roses in the first engraving, but upon the final analysis the end reached is the same. In both there is proof that a rose is only a branch more or less modified, shortened and swollen, and bearing leaves that form a change of form and coloring designated petals, etc., instead of leaves. Flowers, in short, are transformed stems with their metamorphosed leaves for a purpose other than that of food synthesis. These malformations are sometimes the key to the true significance of the parts that have been changed. In other words, the disguise is removed and the structure stands out in its plain morphological light.

BYRON D. HALSTED.

Rutgers College, New Brunswick, N. J., Jan. 19, 1898.

TOMATO GROWING UNDER GLASS IN WINTER.

The seed is sown in flats about July 10, which place in a cold frame or greenhouse. Attend closely to watering in this stage as in every other stage of their growth. When the first rough leaf is developed pot singly into 3-inch pots which will carry them until they are planted into their permanent quarters for fruiting, which is done towards the end of August.

Tomatoes can be grown successfully in solid beds, ordinary greenhouse benches or boxes, the latter about 12 inches deep preferable. The soil most suitable is fibrous loam mixed with a little well rotted manure about one-tenth of the latter to about nine-tenths of the loam. Press the soil moderately firm. Introduce your plants, planting twenty inches apart in the row and two feet between the rows, that is on benches.

In training the leader or leaders, as some growers favor one, others two, let them grow, without pinching, until the crop of fruit is formed, then keep them pinched. Strong string is generally used for supporting the plants, one end of string secured to screw eyes in the sash bars, the other end tied near the base of the plants but allowing sufficient room for the development of the stem, the leaf above the tie prevents the string slipping up the stem. The string can hang from the perpendicular position to the horizontal, or any angle between. A plant should have six or seven feet length of string to furnish a crop of fruit. If one leader only is grown twist it around the string as it grows. If two leaders are

Fig. 2.

A Rose from which a branch with several rose buds had grown. (After Masters.)

grown to a plant the second one should be tied into place from time to time. If the strings have to be sloped on account of lack of height, and greenhouse runs east and west, I prefer sloping to the east as more of the fruit is exposed to the beneficial action of the sun. Pinch out all growth from time to time except the leading shoots, also cut the ends of leaves away when too crowded. From the first development of flowers on the plants, until the entire crop is set, shake the plants daily about noon, that is on sunny days, when there will be more or less pollen ripe for distribution. Two or three slight quick taps of the plant close to the blossoms have the desired effect. This has to be resorted to as they are never fertilized by bees, as are most flowers. When the greater part of the crop is set and swelling off the fruit, a mulch of rotten manure is of great benefit or a watering twice a week with manure water (cow manure is the best). I prefer feeding them at this stage rather than to make the soil too rich when the plants are first planted, as then they are apt to grow too luxuriant, at the expense of fruiting.

The greatest trouble in growing a winter crop of tomatoes is to keep mildew away or in check. A house of tomatoes, like a house of roses, is often permanently injured by neglecting to use a little fire heat on cool nights during the month of October with a little top ventilation; it is bound to bring that great evil mildew. If fire heat cannot be resorted to at that time, I certainly would recommend giving a little top ventilation and give every available surface a dusting of air slacked lime and sulphur, equal parts. A tomato crop never wants syringing throughout its career, in fact it is better to withhold water overhead, but don't let them suffer for moisture at the roots.

The first crop of tomatoes on benches being over in February, if planted at the end of August, and the house is wanted for tomatoes again, clear out the vines, cut the strings at the bottom of the plants, slide the plants off the strings and the strings will be strong enough to carry the next crop. The top half of the soil should be removed and replaced by fresh soil, with a moderate dressing of manure. Fork all up together and introduce your plants, which can be had in good condition by sowing the first of December. This crop will come in the beginning of May.

The proper temperature for winter tomatoes is 60 degrees by night with a rise of 10 degrees by day, or more with sun heat. The most useful variety to grow up to date I believe to be Lorillard, seeds saved from plants grown on strong soil. I know of no plant that is more benefited by a change of soil and location than the tomato (that is for seed growing.) H.

THE CELERY LEAF-TYER.

(Phlyctaenia ferrugalis Hbn.)

February 12 of the present year Mr. Robert Mearns wrote Dr. L. O. Howard, entomologist of the Department of Agriculture, that this species, specimens of which in its different stages were received, was doing great injury in greenhouses in Toronto, Canada, and request was made for an account of it, to be published in The Florists' Review. Inasmuch as the writer has had experience with this species, dating from the year 1893, at the World's Fair, at Chicago, Ill., he has been requested by Dr. Howard to prepare the short account which follows.

The insect concerned in this damage is the so-called celery-borer (Phlyctaenia ferrugalis Hbn.), a cosmopolitan moth introduced into this country some time ago, presumably from Europe. Injury is due to the larva or caterpillar. This is yellow or green, with a pale brownish head, and the first thoracic joint, or that just behind the head, bears on each side two small but conspicuous black dots. The body is striped longitudinally with white lines on the upper surface, and is rath-

er sparingly covered with short hairs. It measures nearly an inch in length. The moth which produces this larva is a member of the family Pyraustidae and of the superfamily Pyralidina, and was first recognized and described in this country in 1877, as Botis harveyana Grote. It is an inconspicuous little brown species with a wing expanse of about three-fourths of an inch. The fore-wings are light brown, lined with black; the hind-wings light gray, bordered behind with light brownish.

This moth was described by Huebner early in the present century and its life history was first made public in Europe in 1878. Ten years later it was reared at this office. Further study is still desirable of its food and other habits in this country. Although occurring out of doors, its injuries are confined, for the most part, to plants in conservatories. In Europe it is not known to be especially injurious, but it has already been shown to be very destructive in some localities in America.

The moth lays its white eggs on the plant which is to serve as the food for its larvae. The larva, when hatched, usually conceals itself by drawing together, by means of its white silken web, a portion of a leaf, or thus joins two contiguous leaves, and feeds upon their lower surface, chiefly at night. By day it rests in the same locations and here also transforms to the pupa or chrysalis and subsequently to the imago or moth state. The moth is a night flyer and like the larva passes the day in concealment on the under surface of the leaves.

One writer has called this insect the celery-borer, from the habit of the larva of boring into celery stems, but this is without doubt an exceptional habit as it is normally a leaf-feeder, and although its habits vary, it usually joins together the leaves of the plant upon which it lives. For this reason the name of celery leaf-tyer is proposed as more appropriate.

It appears to feed by preference on the terminal leaves of most plants. Its known host plants include celery, violets and nodding thistle (Carduus cernuus) on which it has been noted in and about the District of Columbia; wandering jew (Tradescantia zebrina), and ground ivy (Nepeta glechoma) which it was injuring at Chicago, Ill.; hemp-agrimony (Eupatorium cannabinum), archangel, or deye-nettle (Stachys sylvatica), and strawberry, on which it has been observed in Europe. This list will undoubtedly be considerably extended by future observations.

The earliest appearance of the moth and the number of broods that are produced annually in the open are not known. Indoors, injury begins from early spring and continues at least as late as September, and probably longer. Two or more generations are probably produced annually, and in hothouses perhaps a still greater number.

Remedies.—It has not yet been ascertained whether a spray of Paris green or other insecticide would effect the destruction of the larva of this species. It can be controlled by hand-picking or trimming away and destroying all infested portions in the green-houses as often as they are detected. This has been successfully practiced in a number of cases, but it is somewhat laborious, and it is hoped that the future may result in the discovery of some more effective remedy.

Hydrocyanic acid gas, the use of which as an insecticide was first developed some years ago by agents of this office and which has been recommended for greenhouse work in the columns of the Review, should be of value against this insect; in fact, Mr. P. H. Dorsett, of this department, states that it is the most satisfactory remedy known for this pest, in his experience one treatment a month sufficing to keep the plants clear of this as well as other insects. For those who are not already familiar with this remedy, particular attention should be called to the cautions given, as hydrocyanic acid is one of the deadliest poisons known, and its use should not be recommended except under the direction of competent persons.

The Division of Entomology would be glad to hear from florists and others who have had experience with this moth that more may be learned of its injuries, its food plants and distribution, and of the best means for its suppression.

E. H. CHITTENDEN,
Assistant Entomologist, U. S. Department of Agriculture.
Washington, D. C., Feb 21, 1898.

SIMPLE FLORAL ARRANGEMENTS.

The Wreath.

Among the many forms that flowers are made to assume, one of the most pleasing is the wreath. At first probably, the flowers were woven into a chain or band, and when of sufficient length, the two ends were fastened together to form a garland. The next step in its evolution would be the addition of a twig fastened in the shape of a circle, to make a foundation, and to give strength and form. This is yet a very good way to make a wreath. One or more pieces of rattan are bound and wrapped with raffia, the flowers and other material are placed as may be desired, each piece being secured by a wrap of the tying material, the ends brought together and fastened, the union carefully hidden, and finished with a suitable bow of ribbon.

Usually, however, the florist makes use of the ready made form, or wire frame; and the illustration shows a plain wreath made in that way on a 12-inch frame. If several kinds of flowers are used, they may either be interspersed over the entire surface of the wreath, or groupings may be made of each of the principal kinds, which is more effective.

In either case, they should not be inserted perpendicularly, but given a suitable incline, and in a wreath like this, should all slope alike. Care must be used if the piece be small to have the shape show plainly when finished; otherwise it will be but a plat of flowers; and whenever it is necessary to explain what an ordinary design is meant to represent, the maker has made a mistake.

W. T. BELL.

THE STORY OF AN EMIGRANT FLORIST.

V.

We halted in front of the graperies to recall the voluminous discussions of D. F. Fish and other high priests of the profession of thirty years ago. A little more of the garden I must show, but before leaving this little square that was about filled up with dwarf pears I remember two plants that many of my readers never saw growing in the open air. One was the olive, barely hardy there, but with the protection of a brick wall it struggled along, and I don't remember its being hurt by the wintry blasts. The other, a large clump of Jasminum revolutum, the beautiful yellow jasmine as fragrant as the grandiflorum for which we occasionally have inquiries when a wedding is on the boards; and it was perfectly hardy. The entrance to the fruit room opened on this square. If by chance the door of this precious room was left unlocked for a few moments a small boy or two made a raid on it, improving each moment of bliss, as the most temperate section of the members of the S. A. F. do at a free feed during our conventions.

The old potting sheds occupied the south side of this square. It was in there the writer was taught the scientific operation of putting a piece of crock as large as a ten cent piece into a 2-inch pot, and into a 4-inch several little crocks were tumbled and perhaps a piece of moss as well; how absurd this was in those small pots. It certainly did not prevent the plants from doing well but did they do any better? If not it was a waste of time. However, it was on the safe side and better than the advice of a most worthy and enterprising man of New York who thirty years ago told us many good things about our business and brushed away the cobwebs with which many of our operators were covered, but who was radical enough to say that drainage was as useless in a 12-inch as in a 2-inch, no matter what the plant was. That worthy man lived to think differently and in his own phraseology he "acknowledged the corn." I can see the Russian mats hanging on the wall, the peat, the splendid loam, the silver sand, the shelf on which were laid the labels, and the faces of many different men, some young men, ardent for their business and to teach others, who have doubtless evolved into a Jaggs, but more vivid is the remembrance of those permanent hands, one will always find on such places, and who are really the trusted men and skilled workmen of the garden. They entered

The Wreath.

SIMPLE FLORAL ARRANGEMENTS. No. 5.

the garden when lads with no ambition to learn but for subsistence, but through years of experience have so acquired knowledge that at potting, shifting, planting, tying and other work can give points to the young gardener who is going from place to place to improve himself. The so-called journeyman gardener seldom gets a chance to have a varied experience; he is put at one job and usually it is a long one. However they are there to work, as well as learn, so they must not complain.

I did not mean to infer that all the lads of the neighboring village who entered the garden developed into skilled gardeners, not by any means; no more than all the workmen we have in our greenhouses will become successful florists even if there were room for all. The large majority will remain merely florists' workmen. They do not spend their leisure hours or even a part of them in reading florists' journals or any other literature. Their time is spent during the day, mechanically, with their hands, while their minds are on their last game of pedro, pool, or their last baby. Their evenings are their own. Would that they would use them in gaining some kind of useful knowledge. Luck enters but little into our prosperity or misfortune. We get our deserts just about as we deserve, and if you don't put something into your heads by reading and observation, when you have occasion to tap your brains there will be a dry bung hole from which nothing but wind will escape. One more word: I often hear such remarks as this: "There is so and so; he never studied much and he made lots of money." Very likely that's the case in thousands of instances; great selfishness. A mind unhampered with any thought but the acquisition of wealth, and alas in many cases imposition and even fraud, has led to many fortunes. An empty mind may envy them. A broad-minded man of education is contented with his lot, even be it humble. His own meditations are a greater solace than all the luxuries that gold can buy.

There were several old chaps, steady hands in this garden, with whom I would much enjoy a chat, but they have long ago passed to that garden where you don't have to lug the hose from one side of the house to the other, where the several systems of heating are not under discussion and the drummer in his official capacity is silent. There was old Tommy F. who was allowed to have very much his own way in the several acres of the kitchen garden, who banked up the seakale, built his melon beds, picked his brussels sprouts and dug his fertile acres, often with a tall silk hat of ancient make. That would seem funny to our young folks but it's no unusual sight, especially in Ireland, to see a cottager tilling his garden patch wearing coarse homespun breeches and vest but topped off with an old beaver or silk headgear. It was usually "the hat my father wore" and sadly needed blocking but perfectly becoming. This good old worthy vegetable gardener was a pious man with a strictly religious wife. It seemed to me that with a certain class, the established Church, the Episcopal, must have been at that time unpopular. If there was a lively religious feeling entered any of their breasts the old church did not afford them scope for emotional display and zeal in the cause. The Wesleyan Methodists had a good many active converts; then there were the Primitive Methodists or ranters who had a small meeting house, I suppose, but whose most fervent revivals were held in houses of the members on Sunday afternoons. At the most distant entrance to the park, at a humble lodge gate, dwelt one of those enthusiasts. He spent the week working in the woods but Sunday he was the center of the circle. It must have been very small, for the largest room in the house was not over 6x9. On a fine summer's Sunday afternoon you could hear, at more than a mile distant, his fervid prayer and the prolonged Amen of his friends. Let us hope that the efficacy of the prayer was in proportion to the volume of sound.

Then there was old Billy B., who lived on the island and who was hairless, having absolutely lost that ornament in middle life by typhoid fever. What a handy old man he was with scythe or shears or edging iron. So far as theology went Billy had no very determined views, being guided by his spouse, who, like many another woman, did the thinking for the family. She was a large, broad woman of what you may call a full habit, but with very pronounced convictions of what was proper. I never had the pleasure of seeing her in church, but I will wager she was a pillar. The following incident will show her great discernment between your duty in this world and a leaning to its frivolities; A club gave an evening with the "Magic lantern" with harmless views. On being asked next day if she attended, she replied: "No, the magic lantern may be all very well, but I don't think it's essential for the salvation of the soul." How we have degenerated this past forty years.

Old George P—— was a gardener through and through and many are the pointers he gave to young gardeners who have since become known to the horticultural world. He could bud and graft, put the finest finish on a grade, lay a line with the nicest curve, and do anything else in the garden where skill of hand was essential. He could also brew some excellent ale and was never backward when it was passed round. No one is more remembered from boyhood days than this same handy man. He came of a long lived family and a few years before we emigrated we saw four generations of this race walking up the road together. He had a brother who was coachman to a neighboring "Sir" and who, I believe, hastened his end by injudicious feeding. Feeling poorly, the doctor asked him what he had for breakfast: "beer and beef;" what for dinner, "beef and beer;" what for supper, "beer and beef." The doctor prescribed a change of diet, but he soon lapsed back into his steady mode of living and passed away with a very red face.

There was one character on this estate who was perfectly unique. It was James Quinn. I mention his name in full for it is recorded in the annals of crime of London. Poor Quinn, as his

name will denote, was an Irishman; one of the very few specimens of that quick-witted race that was to be found in that neighborhood. He was not over four feet six inches in height, but had the strength of a Sandow and the agility of a monkey. He must have been an expert dancer when young, for when an old man he could delight us with his jigs, but he wanted a little coaxing to start him; a glass or two, a lively scrape on the fiddle or an attempt by some awkward fellow would bring him to his feet. Like nearly all native Irishmen he was great on the broad jump, far excelling the native clod hoppers whose bread and cheese stiffened joints were as wood beside him. The fact that Irishmen are great jumpers can be explained most reasonably by an evolutionary theory. Many parts of the island are boggy and a spring from one object of footing to another has through countless generations developed the muscles, and facility to make prodigious springs and jumps. This curiosity, for such he was, did not converse in the rich brogue of Limerick or Tipperary or "Cark" or "Westmath." He came from the far western rugged county of Galway and before he set foot on the soil of England, spoke or understood not a word of English and hereby hangs a tale.

Seventy years ago, counterfeiting was a crime punished by death. There also existed at that time in London, and may be throughout the land, a species of reward for the detection of crime. It was given the infamous name of "blood money." Poor Quinn and two or three companions, who spoke only the ancient Irish or Gaelic, were coaxed into a room by some scoundrels, counterfeit money placed before them with the moulds, etc., then the door was locked on them, the police informed of the discovery, and directed to the locality. They were of course caught in the act, arrested, tried with no one to defend them, and sentenced to be hanged. While waiting execution Quinn mentioned the name of Sir ———, owner of the estate from which he had come in Galway. The guards understood that name and the baronet who owned the name was communicated with, and inquiry revealed the work of these scoundrels, who doubtless, by that time, had drawn their pay. Quinn and his unfortunate companions were released and from this very case and the following inquiry and exposure that followed, dates the abolition of the infamous system of blood money.

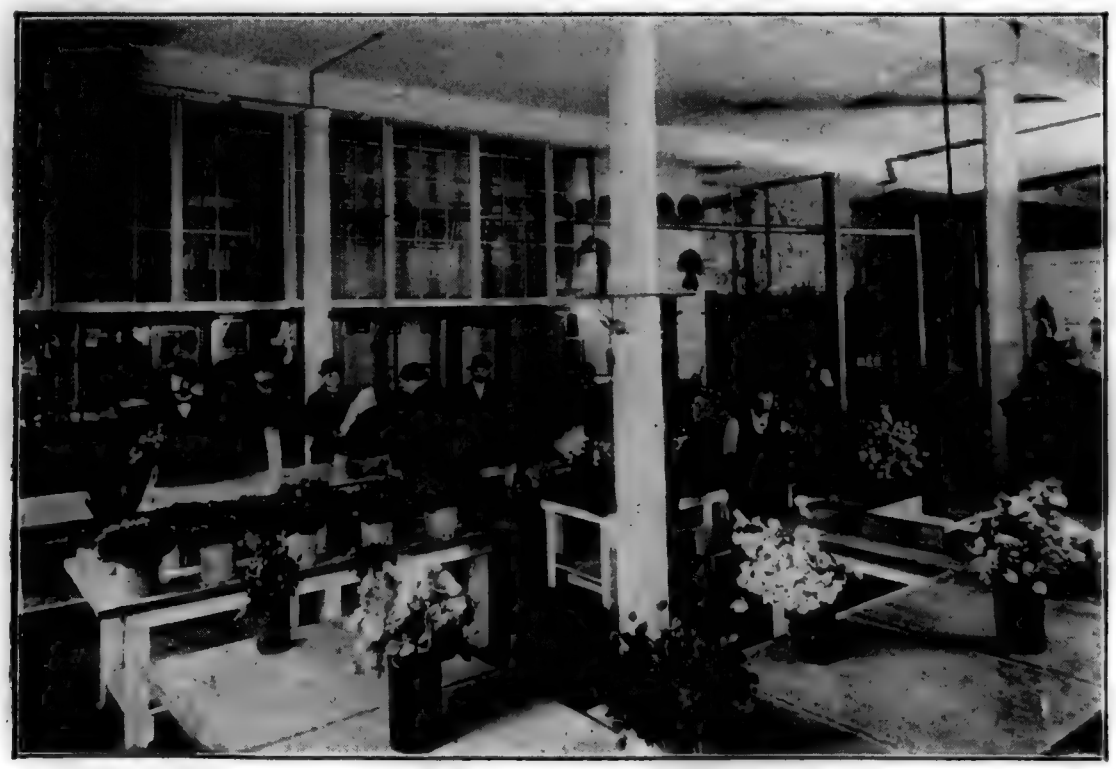
Quinn was ever after a ward of the man who saved his life, and as he was also the owner of the garden we have been wandering in, he found his way there. I could fill a book with stories of him, but must close. He was not tasty in his apparel. His patron and countryman, a relative of the proprietor, Captain L——, was 6 feet 2 inches, some 18 inches taller than Quinn, but that did not prevent the latter from accepting the captain's cast off clothing. Many a time I have seen Quinn washing pots on a winter's day (the pace was about three pots per hour), wearing the captain's trousers, no need of a vest, the top rim of the trousers touched Quinn's chin, but in spite of that he declared in his quaint broken English: "Bother my dear I just take the captain's pants," meaning they were a good fit. Quinn frequently asserted "his Mary Ann paid two guineas to be a tailoress." She had evidently in her long years of married life and domestic trouble forgotten the useful art, for Quinn often appeared with a large patch of red or blue flannel in a back ground of black pants. Mary Ann attended her church very regularly and swallowed all the gin she could lay her hands on. Poor Quinn had a natural instinct for appropriating any loose article that was not chained, particularly firewood and vegetables; in that he was like the noble red man or our faithful dog. With these slight exceptions they were a very harmless family.

Pineapples were grown in this garden to perfection and occupied several long, well-heated structures that we called pine pits. They were not fruited in pots of 20-inch diameter, as some gardeners believe they must be, and another innovation was practiced that I believe was not in general usage. After the suckers were rooted in small pots they were planted in beds and made twice the growth they would if kept in pots, then lifted and fruited in 10 and 12-inch pots. I have helped my father pack for London almost tons of grand pineapples, each wrapped in tissue paper and tightly packed in boxes with hay, but those were the days when at certain seasons they were worth two dollars per pound and even more. The Queen and Black Jamaica were mostly grown. Smooth Cayenne, perhaps the best of all, was not so well known then. Black Prince and Providence were cut as heavy as eight and nine pounds, but the flavor is poor, a Queen of four pounds and a Black Jamaica of three pounds is a good, fair fruit. In those days the pineapples that were grown in the Azores and Jamaica were not much larger than an Easter Beurre pear and not tolerated by anybody. Some years ago good gardeners were sent to the West Indies and the Azores, and their cultivation made a business. Wi h that and rapid transit the fruit now sent to London and our ports is of such excellence that the cultivation of pineapples, once a lucrative industry, is about commercially abandoned. At the same time a slice of liberal size from a hot-house Black Jamaica would induce me to lay down my pen, and wishing I had it now, I wish you for the present good night.

BIBBER.

(To be continued.)

Miscellaneous Seasonable Hints.



Azaleas.

I receive at this time several inquiries about the earliness of Easter stock. Although it is a threadbare subject, still it is of great moment to many a one at this time. When these lines are before the readers it will be just five weeks to Easter Saturday, the day we want everything at its best. Without moving, manuring, shading, forcing and retarding it is impossible to get all your crops in about right.

You can see by this time what azaleas will be sufficiently forward and which of them need a little more heat. The variety so largely grown, Mme. Van der Cruyssen, is opening rapidly, and so is that splendid pink, Memoire de Louis van Houtte. The ventilators must be kept open day and night when possible. What will help retard them very much is shading, for now is the season when bright days will come, welcomed by all, but disastrous to a crop that you wish to retard. You can tack up cheese cloth or some such material beneath the glass, that will be shade, but will not lower the temperature of the house, and I would prefer a coat of whitewash on the outside that will lower the temperature as well as shade. You need not fear that it will remain on to hurt your plants that come later. Frost at night and heavy April showers will remove much of it. It is much easier to slightly force the backward azaleas than retard the earlier, but both can be done.

Cytisus—Lilac.

The same treatment can be given to cytisus, which with us is too early. If it is just beginning to show color it is in plenty of time. Three weeks is ample time to give to lilac. If given

Cut Flower Department.

Seed and Supply Department.

GLIMPSES OF THE WHOLESALE STORE OF E. H. HUNT, CHICAGO.

three weeks in a temperature of 60 degrees at night, they will be in ful flower. With us they are particularly good this year.

Hybrid Perpetual Roses.

If hybrid perpetual roses are distinctly showing their buds you have them nicely in hand, and a night temperature of 55 degrees will bring them about right. A light fumigating is very necessary. It will certainly not hurt them before they show color, and if neglected you will surely be attacked by aphis, for the young tender growth of H. P. roses is as toothsome to the green fly as the late banquet at Chicago was to the rural members.

Bulbous Stock.

Very briefly I will mention that it is much too early to bring in any bulbous stuff for Easter, but occasionally very misleading statements creep into print, and you might be the victim of misplaced confidence. The weather has so much to do with bringing this bulbous stuff into flower. If it were planted in October and November, and ordinary conditions prevailed, it will by early April be so near its natural flowering time that but a few days inside is sufficient. So I will briefly say for Dutch hyacinths allow 14 to 18 days; single tulips and Von Sion narcissus, 18 to 20 days, and double tulips, 22 to 24 days.

Lilies.

The Bermuda and Harrisii lilies will be receiving many an anxious glance these days. I have repeated several times and with all the earnestness at my command, "Be early enough and have a few days to spare." To be definite, I would say that if the buds, the lowest ones which are the earliest, are two inches long five weeks before Easter you are safe and they will not need a forcing temperature, but will come on in time in a night temperature of 55 to 60 degrees, which, for a flowering lily, is almost below the natural heat they would receive out of doors during their flowering time. The longiflorum are late with us. More's the pity, for they are extra fine in quality. They have never been cooler than 60 degrees at night since they were one inch high, but yet they are only just showing bud at this time, and will want at least 70 degrees at night and 85 degrees daytime to get them in flower. When once the buds are above the leaves you can smoke regularly and mildly. The puncture of the very small bud by green fly often ruins it and accounts for that whorl, twist and burst, which are often seen. This trouble has nothing to do with the disease. If you are foolish enough to retain any of them you will find that as fast as the plant develops the new parts are attacked, and the buds, being the last part of the plant formed, show the disease last, but it will get there sure enough and effectually close up the petals. Throw them away before they have a chance to make you ill-tempered or produce melancholia. Spiraea should not be too early or it loses its beauty. If showing its flower spikes now, it will be in plenty of time.

Temperature.

The month we are about to enter again is a busy and anxious one, and trying to the temperament, watchfulness and ability of the one in charge. We often have great extremes of temperature in March and in old fashioned houses, heated with old-fashioned 4-inch pipes, suffer sadly with overheated houses on bright days. The temperature may have gone down to 15 degrees below during the night, necessitating hard firing till daylight, and so when our earth dips to east and we tiny creatures are blessed with one more opportunity to gaze upon that gigantic mass the origin of all heat and life, which some of our flippant friends call "old Sol," he is beaming down upon us with such energy that our glass-covered structures are away up. Much of this cannot be prevented, but much can be helped. The earliest hand around, and that should not be later than 6 a. m., can easily see if we are going to have a bright day, and the furnace door can be opened, fires made dead, and just as soon as possible a small crack of air put on. It's wonderful what a lot of good a little ventilation will do if applied early, and so

much better for the plants than waiting till 10 o'clock, and when the heat is suffocating putting on a foot or more at once. Those who are blessed with steam, or what is next best, hot water, with small pipes, are relieved of this hot 4-inch pipe when least needed.

Shading.

The construction and aspect of the house will have much to do with the need of shade. In any house where the sun can strike it, palms will need a little shade. In a house running north and south there is scarcely anything that needs shading at this time, except the propagating bed, but violets with a south exposure must be shaded; that I have seen strong evidence of the past two weeks, the buds appearing as good as ever, large and dark, but before being well developed sadly bleached out. So on went the shade. Speaking of shade, until we get some clever and ingenious man to invent some portable shade to apply when we need it and dispense with when we do not, we have no choice but to use that crude and unsatisfactory method of whitewash. For a shade to last all summer, I do not approve of what is generally known as whitewash, which is quicklime slaked with water, and salt added to make it stick. What is much better, both for light and appearance, is naphtha and white lead, adding the lead until you get it the right thickness, and remember it will dry thicker than it appears when first applied. In cases when you want it on in a hurry, it can be syringed on, but that is not a satisfactory way and by applying with a good brush you will save more in material than will pay the extra labor.

The Propagating Bench.

I cannot do more than remind you not to let an inch of your propagating bench be idle. The whole of this month you should propagate sufficiently for your spring sales. In the sand I notice this morning we have sweet alyssum (of course the double), senecio, lophospermum, lemon verbena, sedum for baskets, lobelia, coleus, achyranthes, acalyphas, salvias, sweet stevia for next winter, and a large portion of the bed is devoted to chrysanthemums.

The Hot Bed.

In the way of a reminder there are many florists who depend upon hot beds after April first, not only to relieve their overcrowded benches, but depend upon them to grow several bedding plants better than they could in the greenhouse, and this is certainly a fact. So get your material as soon as you can. It should not be hauled from the stable and made into a hot bed. It needs turning over at least once, and remember that if you can get your friend, the brewer, to give you a few loads of refuse hops it is a most valuable addition to the stable manure, and when thoroughly decomposed is an excellent substitute for real leaf mould. WM. SCOTT.

PRUNING HYDRANGEAS.

I have quite a lot of hydrangeas in large tubs and pots for veranda decoration, Otaksa, Thos. Hogg, etc. I keep them in a cold cellar and prune them in February, cutting back each branch to a good large plump bud, and rub off all remaining buds on the branch, except two or three of the largest. Is this proper? Would I get more and better flowers if I did not prune at this time, and saved the terminal bud at the end of branch? These branches are of last year's growth, have dropped their leaves and are well ripened. Would the terminal buds be more likely to produce flowers than the largest buds along the branch?

F. P. L.

"F. P. L." has undoubtedly cut off many of the buds that would have given him his finest flowers, the terminal buds usually producing the finest blooms. The trouble then arises if you don't prune at all you soon have a straggling, unwieldy plant; so you must make a compromise. Shorten back the longest growth, only leaving the plant in outline as compact as possible, and saving as many terminal buds as you can. Then cut out the weak growths entirely, but rub off no buds from side of shoots, as many of those, as well as the very bottom growths, will give flowers. W. S.

PRIMULAS.

"Some of my primulas decay at the surface of the soil. Can you tell me why? Others of the same varieties close by grow finely."

We suspect that those decaying have been in a drip and got overwatered. We saw the result of that by an accident early this winter. A primrose does not like dampness at any time, and although it should never be allowed to get killing dry it likes an airy, dry house without being too warm. W. S.

BOTTOM VENTILATORS.

"Are there ventilators which can be set in greenhouse glass near the eaves for extra ventilation? What do they cost, and where are they to be purchased, and how are they set in place?"

I have a faint recollection of seeing such ventilation used in a very ancient greenhouse. In a new structure, if desirable, they could be provided for without any great additional cost, and could be furnished by any horticultural builder or those supplying greenhouse material. I scarcely think it worth while to go into detail of how to arrange them, because I see none used in modern greenhouse structures, nor do I think they are in any way desirable. Side ventilation, which would have the same effect, is very desirable for many plants, namely, violets, carnations, a great number of bedding plants, cool orchids and plants summered over under glass. If the sides of your house have two feet of upright glass it can be in the shape of sashes and hinged at top under plate. If the walls are wood, a continuous section of it, say one foot broad, could be hinged; when closed it would be simply part of the wall; when open it would be the best of summer ventilation. W. S.

SWEET PEAS.

From "J. E. B." comes the following: "My sweet peas died early in September—those in new section of the ground as well as those in the old places. My neighbor, who had the same kind of seed, cut flowers until November, as I have always done. The vines appeared to dry up, but there was more moisture than usual."

This drying up may have been caused by more conditions than one. Sweet peas, if wanted to last throughout the summer, should have a deep soil, not too rich in manure, but deeply dug or trenched, that their roots may not be dried out in long spells of dry weather. If sown in a trench or a slight depression, you can occasionally give them a good soaking, which will help them greatly. Last August would certainly dry them up if not watered. Another cause of their going off would be allowing them to go to seed. If the flowers get very cheap and you thought they did not pay to pick, they would bear a heavy crop of seed, and that is more exhausting than six months of flowering. They are simply fulfilling the most important function of all annuals, and are then ready to die and leave their seed for reproduction. W. S.

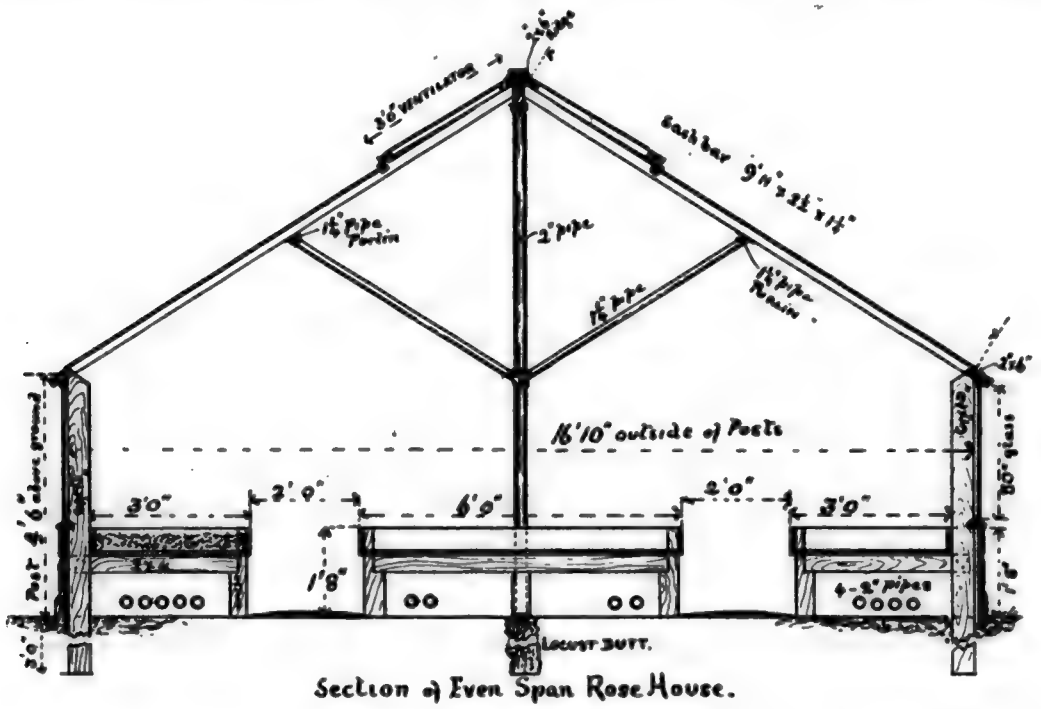
RATS AND MICE.

I note an inquiry for a poison for rats and mice. The following cleaned our place of the pests in quick order:

Get some of the old-fashioned black sulphur matches, now generally called eight-day matches. Cut off the black ends and put six or seven of these black tips in some bread that has been moistened in milk, and roll the bread into marbles about the size of common playing marbles. Have six or seven tips in each marble. Rats seem crazy for this poison, and after eating one marble they will not live to see another day. SUBSCRIBER.

We note the inquiry as to how to get rid of rats and mice. We were troubled with them last winter and they destroyed a great many flowers. We tried all sorts of poisons and traps, and the best results were from equal proportions of corn meal and plaster of paris. We filled small plant saucers with this mixture and placed them every fifteen

or twenty feet in the carnation house. We were soon rid of the rats and mice. When watering, be careful not to wet the mixture, as it must be eaten dry to secure results.



GREENE & UNDERHILL.
Watertown, N. Y.

GREENHOUSE CONSTRUCTION.

Please tell me the best way to build a rose house on a lot 60x200 feet, with a drop of 8 feet in the 200 feet, sloping toward the south. Give length of sash bars, height of walls, width of house and best bench arrangements.

SUBSCRIBER.

I would advise an even span house, as shown in sketch below. The width

Section of Even Span Rose House.

being 16 feet 10 inches outside of the posts, and the length to suit his requirements, say 150 or 200 feet. The potting shed and boiler cellar will necessarily be at the south end, that being the lowest, but if it be placed at the west side at the south end the objectionable shade thrown by the shed will be slight, as it will not develop until the afternoon. For the heating I would use thirteen lines of 2-inch wrought iron pipes, arranged as shown, and if the house be 200 feet long, a boiler having a grate surface of seven square feet, or if the house be only 150 feet lonf, a grate surface of five feet.

HENRY W. GIBBONS.
New York.

SIMPLE FLORAL ARRANGEMENTS.

Suggestions on the Use of Cards.

"H. H. C." asks: "What would have been considered the correct manner of sending, or attaching to a floral design the names of the givers, who were the sister members of a small reading club to which the deceased had belonged, and for whose funeral the design was intended?"

If I had been born near Killarney, I would perhaps say that the correct way to attach the names to the design would be to send them unattached. By this I mean to advise against fastening cards to flowers unless requested by the sender, or in the case of designs coming from military or fire companies, or from lodges, when it seems to be expected that a card shall appear on their contribution.

In this case, the names should have been neatly and plainly written with pen and ink on a plain white blank card of sufficient size to contain them when placed under each other, the card then placed in a plain white unmarked envelope just large enough to take it in, which should be inclosed in the package with the flowers, so as to be readily seen when opened. If the club had a name, and the surv.ving members all joined in sending the tribute, the name of the club on the card would have been sufficient, and best.

In our own practice, we furnish and mark most of the cards we use, and keep a stock of plain white visiting cards in two or three sizes, with envelopes to match, all of the best quality we can procure. The card is placed directly on the flowers, avoiding moisture, and not outside of the folded waxed paper lining of the box, where it might be displaced and overlooked in opening.

When it is necessary to attach a card to the work, we make a hole in the upper left-hand corner of the card with a punch, through which about half a yard of narrow, plain-edged ribbon ("baby ribbon") is drawn, which may be tied to the handle of a basket, or to a flower stem at the base of a cluster, first making a double knot in the ribbon, about an inch from the card. If to go on a wreath or similar design, the ribbon is tied in a double bow knot, leaving sufficient play for the card, a piece of stemming wire is run through the loop and fastened to a toothpick which is inserted in the piece as a flower would be, but near the edge where it will be seen.

If your patron leaves a card to be sent with flowers, you may send it even if soiled or unsuitable, without being considered as lacking in taste yourself; but do not use ordinary paper instead of a card, do not fasten it with a piece of wire or white cotton cord, and do not use your business card, for lack of a blank one, nor inclose it with a proper card, thinking this enterprise; and do not send the card in your business envelope, or you may be taken for a "crape-puller," a reputation which I trust will never be given deservedly to any subscriber to The Review.

W. T. BELL.

COELOGYNE CRISTATA.

C. Cristata, when well grown, is, without exception, the most handsome species in this genus, and just now should be conspicuously in flower, and if kept in a cool, dry atmosphere the flowers will retain their beauty for a considerable time. The plant will not be injured should it not receive any water while the flowers last, but previous to the opening of the flowers and after they are cut, just sufficient moisture to keep the pseudo-bulbs from shriveling will be all that is necessary.

After the flowers are cut is a good time to attend to any top dressing or repotting that may be necessary. A compost of peat fiber and sphagnum moss suits this species. It may be grown in a hanging basket, but shallow pans with good drainage are preferable. If grown in the latter way the plants should be raised upon a moderate sized cone above the rim of the pan, and firmly fixed down with barbed wooden pegs.

Water sparingly until the plant has a good hold of the compost, when it enjoys a copious supply of water and frequent applications of liqu'd manure, which should be continued until the new bulbs are finished, when water should be withheld to the point advised above. When growing this species does not require a high temperature; 60 degrees will suit it, and 10 degrees lower when resting.

J. ROBERTSON.

CANNAS.

"How should cannas be divided?" The old clumps of roots, if properly cared for during the winter, can be cut up into several heads or eyes, which are easily detected. One eye, with root a few inches long, is sufficient to make a good plant. Divide at once. You can pot each in a 4-inch pot, or place a number of them in a flat close together in 3 or 4 inches of sand or light soil. Place the flat on your hot water pipes, and when they have made a leaf growth of 6 inches, place in 4 or 5-inch pots and give them a light bench.

W. S.

CHICAGO.

Club Meeting.

At the last meeting of the Florist Club the carnation convention committee made the very gratifying report that after paying all bills they would have a surplus, and that the contributors to the fund would receive back about 25 per cent of their contributions. The committee was accorded a warm vote of thanks for the able manner in which its work had been conducted. Two new members were added to the roll.

Mr. J. T. Anthony read a paper on marketing cut flowers, in which he emphasized the importance of grading all flowers sent to market, and pointing out wherein this was to the direct advantage of the grower. He indorsed the views expressed in Mr. Kennicott's essay as regards bunching carnations.

In the discussion that followed Mr. Stollery held that it would not be long before carnation flowers would not be bunched for market, but would be shipped in layers, as in the case of fine roses.

The next meeting of the club, March 10, will be "Rose and Violet Night." The essayists have not yet been selected, but these two important subjects will undoubtedly be thoroughly discussed.

The Market.

There is a much better supply in the market, and though the demand is keeping up very well in view of the beginning of Lent, prices have dropped. In roses the teas range from $4 to $7, and only a few of the very extra grade bring as high as $8. In carnations, ordinary flowers range from $1.25 to $2, while extra grade sell up to as high as $6. Some fine Daybreaks bring $4, while the highest grade of Mrs. Bradt go as high as $8. But the great bulk of the stock goes at the lower figures. Whites of good quality rarely go below $2, and white seems none too plenty. In bulbous stock there is an immense supply, and of some sorts there is a decided glut, especially in tulips of ordinary grade.

Bassett & Washburn are cutting from 200 to 600 Harrisii per day, and find sale for all. They report good demand for Harrisii all through this season, the price having never dropped below $8 per 100. They are already receiving inquiries for Easter. They are also cutting large quantities of valley of extra quality. Price is now $3 a hundred.

Kennicott Bros. Co. report a big increase in supply and a surplus in many lines, especially in bulbous stock.

E. H. Hunt notes a swelling of the supply beyond that of the demand. His weekly report will be found elsewhere in this issue.

W. E. Lynch is receiving more stock, but demand is fair at the reduced prices.

Winter & Glover report about the same, and with confidence that trade during the Lenten season will this year show the usual annual increase.

Vaughan, McKellar & Winterson find the supply decidedly ample, but report sales good with the lower prices to move the stock.

E. C. Amling, Rogers Park Floral Co. and A. L. Randall make about the same report. The general feeling is that business during Lent will be better than the same season last year, the shipping orders holding up very well so far.

The slump in prices the latter part of last week well illustrates the sudden variations to which the cut flower market is subject, and fully warrants the legend, "subject to change without notice," that appears on the price-lists of the wholesalers.

Death of A. H. Saxon.

We much regret to have to record the death of Alfred H. Saxon at his home in Downer's Grove, Feb. 25, of consumption. Mr. Saxon has been in poor health for several years, and made a heroic attempt to carry on his business in the face of many difficulties. He was laid at rest last Sunday, the funeral being in charge of the Order of Woodmen, of which he was a member. He leaves a widow and several small children. It is probable that Mrs. Saxon will not attempt to continue the business, and we are requested by a friend to ask florists looking for a business opening to consider this establishment. The greenhouses and contents are in excellent order.

Various Items.

Bassett & Washburn are growing this year 40,000 bulbs of Lilium Harrisii, from which they will cut over 100,000 flowers.

Henry Fritz, formerly gardener for H. N. Higinbotham, at Joliet, was killed in a cable car accident in this city on Feb. 23, and was buried by the Knights of Pythias, of which he was a member.

Henry and George Klehm have been visiting St. Louis for the last few weeks.

Last Saturday there was on view at Kennicott Bros. Co.'s establishment a vase of carnations from Mr. F. Dorner, Lafayette, Ind., and among them were several blooms, half red and half striped on white, labeled "Kennicott's Mongrel," evidently in allusion to that gentlemen's use of the term "mongrel" in his essay at the carnation convention. It was a large, handsome flower, evidently a sport from Mrs. Bradt, and Mr. Kennicott said that he would undertake to find sale for these parti-colored blooms quicker than for the striped form. He said he would "father the mongrel." The vase also included five blooms of White Cloud and Gold Nugget, and it was noticeable that the last named was in as good form the following Monday afternoon as when first received, showit to be a fine keeper.

Mr. G. H. Peiser, of Kennicott's, has returned from his southern trip.

Echoes of the banquet to the Carnation Society are still heard. "It was a great event," is the general verdict.

Mr. J. A. Evans, of Challenge Ventilator, Ind., remained after the convention and called on his friends in the trade.

Mr. C. W. Ward, of Queens, N. Y., also made quite a stay. He visited Hinsdale, and was much impressed with the immense establishment of Bassett & Washburn.

A. Lange, successor to Harms & Lange, has removed to 163 State street, where he has an excellent location.

It is rumored that plans are being made for a new greenhouse plant of tremendous proportions, of which Charles A. Neuner, formerly of Louisville, Ky., will be manager. According to the report, the range will contain sixty large houses. A local capitalist is said to be back of the enterprise.

At the next meeting of the Florist Club Mr. Fred Hills will read a paper on "How to Grow Tea Roses for Profit."

BUFFALO.

Trade Fine.

About the best way to get a correct version of the state of trade is to inquire of our wholesale men, "How is business?" They are in touch with the general pulse of the retail business better than any individual, and Mr. Pickleman says that the demand is good. Mr. Kasting replies to our query that trade is fine, with a good demand for all good flowers, and shipping trade never better. Lent arrives without any comment. Large parties are certainly non-existent, but the general trade is little affected by this pious period.

A Bargain Day.

There was a little tilt down the street a few days ago between two well known and enterprising florists. It was the occasion of both making a "bargain day on daffies." They kept reducing the price, but kept up the quality of flowers, which with both was most excellent, till they both fell exhausted into the arms of their stenographers, and the public had received "daffies" at about the cost of the bulbs. There never was at this season a finer lot of flowers and plants offered for sale; everything in abundance and of finest quality. When you have a lot of stock and don't have to skirmish round to fill orders, you are apt to think business is not what it should be. The fact is, business is quite fair, with supply in abundance.

The building of the extensive range of houses at the Botanic Gardens is still in abeyance, the contract not yet being finally let. This is a pity, as we had hoped to see this grand range completed the coming summer. Thank goodness, the sinews of building are all ready when the contract is let.

Mr. McMillan Leaves for New Jersey.

Mr. William McMillan, our widely known and much respected late park

superintendent, has settled negotiations with the Essex County, New Jersey, park commissioners, to superintend the construction of their elaborate and extensively projected park. The area of the park, without the approaches, covers 2,600 acres, and surrounds the "three Oranges." Mr. McMillan begins his duties at once. His call was very sudden, but he did not get away fast enough to escape a farewell reception by his many friends in the city. A very handsome gold watch was landed into his vest pocket. But that, I believe, would not afford him so much pleasure as the many warm expressions of regret at his departure and wishes for his long life, happiness and prosperity. Essex County is to be congratulated on having secured the able and honest ability of Mr. McMillan. W. S.

NEW YORK.

Dinner of Florists' Club.

Last Saturday evening will long be remembered by all who attended the eleventh annual dinner of the New York Florists' Club, as one of the good things oratorically, gastronomically and florally. In a word, it was a success, observed from any point, and will act as a milestone in the era of the club's history to be long remembered, and honor is due to all and congratulations should be mutual.

Mr. Patrick O'Mara, who acted as toastmaster, proved that the reports from the provinces had not been overexaggerated, and that as a "composite" of all that goes to make a good toastmaster, he is in fact "the beau ideal."

The tables were weighted down with the choicest of flowers, thanks to the contributors and the committee on the whole. Mr. Lawrence Hafner's affability proved an important factor in securing contributions from the following gentlemen:

President Plumb contributed handsome vases of Bridesmaid roses, fancy carnations and lilies, and Siebrecht & Son sent some handsome leaves of Cycas circinalis, also palms, Dendrobium Wardianum; John N. May, carnation, Lily Dean, and his beautiful new rose, Miss Clara Watson; W. A. Manda, a well furnished pan of Adiantum Farleyense; John Young, center pieces of Beauties and mignonette, very rich; Ernst Asmus, purple and white lilac and lily of the valley; Julius Roehrs, lily of the valley and cut orchid flowers; Rudolph Asmus, pretty vases of daffodil "Golden Spur;" J. M. Keller, flowers of Dendrobium Phalaenopsis Schroderiana and Cattleya Trianae; Frank MacMahon, grand vase of Bridesmaid roses; Frank M. Niquet, his carnation, Maud Adams; John H. Taylor, the beautiful new rose, Dean Hole, which lights up prettily at night; Charles Pesenecker & Son, pretty vases of carnation William Scott.

All the allied trade was well represented and the following visitors were among the seventy gentlemen present: Prof. Smith, New Brunswick, N. J.; Dr. L. N. Britton, of the botanic gardens, New York city; W. N. Rudd, editor of the American Florist, Chicago; J. Donahue, Lenox, Mass.; W. G. Gomersall, Poughkeepsie, and A. Herrington, Madison.

A word of praise to the indefatigable committee on arrangement—Chairman Chas. Weathered, John H. Taylor and Ernst Asmus—whose untiring efforts were the primary cause of the unqualified success. Mr. John Young, the genial secretary, should also be coupled with the above. "He saw his duty and he done it."

President Plumb, rising to welcome all present to their eleventh annual gathering, and to introduce the master of after ceremonies, said they had arrived at the point where the feast of reason and the flow of soul was in order, but he presumed it was necessary he should say something first about club matters. Of the past we all know well—its successes and reverses; but let us look forward and consider a future for the club which shall be all success. The members and ofcers have worked earnestly to insure this in the present year. We have already elected twelve new members; we have fourteen names to be acted on at the next meeting, and ten others are knocking for admittance. We have all to put our shoulder to the wheel, and I hope we will keep it there. We shall find lots of ruts in the road, but if we all push together we are bound to succeed. Let us endeavor to keep up the earnest work of this year and we shall, if we all try earnestly, accomplish all we have to do, looking forward to the getting of a home that belongs to the club. I now have the pleasure to introduce to you one whom we all know and respect and love, whose qualifications as toastmaster are known to all, who besides is an earnest worker and friend of our beloved club—Mr. Patrick O'Mara.

Mr. O'Mara spoke as follows:

"The speech I intended to make I must ask leave to print, as there are so many letters of regret to be read. In selecting me for toastmaster, the president has got right into one of the ruts he said we wanted to get out of. The following societies and gentlemen sent letters of regret—some humorous, some pathetic, all regretful, with the exception of one signed "Aspidiotus Perniciosus," from San Jose. This entomological friend said he preferred to associate with the nurserymen and to dine off the fruits of his native habitat.

The list follows: The Baltimore Florists' Club, the Chicago Florists' Club, the Philadelphia Florists' Club, the Boston Florists' and Gardeners' Club, the Buffalo Florists' Club, the Dutchess County Horticultural Sociesty, the American Carnation Society, Richard E. Connell, Poughkeepsie, N. Y.; John Westcott, Edwin Lonsdale, W. K. Harris, D. D. L. Farson, Philadelphia; Prof. Byron D. Halsted, New Brunswick, N. J.; George Saltford, Rhinebeck, N. Y.; Franklin A. Whealan, Mount Vernon, Va.; Edward Hatch, Boston; George W. Anderson, Milton, Mass, and Charles R. Russell, Lenox, Mass.

Mr. O'Mara then informed the gentlemen present that he had a topical poem by the Brooklyn bard, J. Austin Shaw, and, striking a pose fitting the occasion, he wafted to his hearers the following:

It seemed to me long years had passed
away.
My spirit, freed from earth's encumbering clay,
Mounted on wings, beyond the azure sky,
And through the universe began to fly.

My mission 'twas "to seek and find the
lost!"
And to locate them all, at any cost.
The New York Florist Club had gone
astray,
And where they'd lit, no mortal man
could say.

I flew now north, now south, now east,
now west,
But nowhere found the star whereon
they rest;
I searched the heavenly regions, far and
near;
Not one, for all my searching, did appear!

And though it's not a proper thing to tell,
I couldn't find a trace of them in—well,
At any rate, I gave up in despair,
I found no shadow of 'em anywhere!

And as I swiftly flew back, sad, belated,
I fully thought the lot annihilated.
But, all at once, as we approached the
planet,
I said to Harry Bunyard: "Harry, can
it

Be possible they lit upon the moon?"
Said he: "Let's visit that dead planet
soon!
At least, it was dead back in '98!"
Said I: "Let's go at once—I cannot
wait!"

Astronomers have lied—the moon's not
dead!
In autumn, dost you know, it's always
red?
The secret's out! They paint it up and
down
As on old earth they used to "paint the
town."

Harry was fat, and weary from his fly,
And didn't seem to want to farther try;
But I suggested, if we found 'em there,
There would be women angels, I could
swear.

This thought so many happy memories
waked
That Harry flew so fast the heavens
quaked.
As we hustled, lightning-like, through
space,
I lost some feathers trying to keep pace.

And I was—truer word was never spoken—
Lucky to get there with my wings unbroken.
However, sirs, we got there—he and I—
And solved the greatest mystery of the
sky.

Dead? I guess not. The moon was full
that night,
And every soul upon it, too! That's right.
And palaces and flowers and buildings
tall—
The New York Florist Club, sir, owned
'em all.
In fact, I found no spirit there was
worth
Unless he'd joined the club while on the
earth.

Well! 'Twas a royal welcome, cheering
grand,
Which greeted us as we began to land;

Before Taking.

ANNUAL DINNER OF THE NEW YORK FLORISTS' CLUB.

And such a time as we put in up yonder
In that fair moon, beyond the clouds and thunder.

The story it would take too long to tell;
Some other time, perhaps, if all is well,
How Harry sought in vain for angels fair,
Because, you know, there are no women there.

What were the boys all doing, did you say?
Well, doing always something, anyway.
Our old friend Plumb was president a while,
And ruled his empire with the same old smile.

And always eloquent, with pen and tongue,
His secretary still was good John Young.
A verdant vale was changed from a Sahara,
By rampant, energetic Pat O'Mara.

All up and down the sweetly scented way
The roses bloomed for genial John N. May;
And seldom is an orchid forest grander
Than one I saw in charge of Mr. Manda.

The orange groves! You know the dear old "feller"
Who has sole charge. Who else but Papa Zeller?
Who for that wondrous stretch of palm land cares?
That jovial spirit must be Julius Roehrs.

Azaleas brilliant glow with wondrous light,
And flowering say of Keller, "He's all right!"
Carnations sweet, how gloriously profuse!
I guess you know the brothers Dailledouze.

But there time flies. I cannot name them all.
Not one is missing—Allen, Asmus, Small,
Names known to fame, Bennett and Childs and Dean—
The grandest galaxy I've ever seen!

Here's De La Mare and Siebrecht, Dressel, Don—
No whiter souls did e'er the sun shine on!
Esler and Falconer and Robert Gray
Salute them as they pass in bright array.

Hitchings and Henderson and Krick and Joosten,
How little need for men like these our boostin'.
Jansen and Kelsey—surely of these we'll sing;
Lonsdale and Lang and Koffman Smilax King.

McConnell and McGowan and McMahon,
McDonald, too—and match them if you can,
Millang and Morris, Pierson and David Mellis;
Did ever such fruit grow on an earthly trellis?

Sutton and Schultheis, Rath and Louie Smutz,
I wonder if they ever shoot the chutes?
Elliott and Sheridan, and J. H. Troy,
And Brother Stewart, the brave Boston boy!

No end of them—you see they're passing still;
Ward and Suydam, Weber and Underhill,
Weir, White and Wallace—all of them far from dead;
Young, Leahy, Taylor, Charley Weathered.

Some day I'll tell you all about the rest.
They're all well settled there, among the blest,
And strange but true! grand harmony prevails
And friendship reigns! (This is no fairy tale.)

Introducing the toast, "Our Night," Mr. O'Mara paid a deserved tribute, saying: "One of the first to put his hand to the plow, and one of the last who will take his hand from it; always ready at the call of duty, presiding officer for a time, one of the brightest stars we have; a grower, a man and a gentleman. I will call upon Mr. J. H. Taylor," who in reply said, among other things:

After Taking.

ANNUAL DINNER OF THE NEW YORK FLORISTS' CLUB.

"On this, our night, the grower, retailer and florist join, meeting only to drop all matters of barter and discussion, and to enjoy an evening when you meet men you have not seen possibly since the previous dinner—guests you hear of or have read about, gentlemen from other states. We welcome them here on our night. We have had many reunions in this room, but the magnificent display of flowers on this occasion surpasses anything we have previously had. In this we show to our guests and ourselves the advancement horticulture is making in this country. It is so rapid a man has all he can do to keep pace with it. Mr. John Thorpe, at one of our recent dinners here, stated that we would see carnations four inches in diameter, though few thought so then. Mr. Thorpe is one of our eminent horticulturists, who looks far into the future. We have carnations here to-night that measure three and one-half inches, and we have seen carnations that would measure more than that."

The "S. A. F. A. O. H." was responded to by Mr. W. A. Manda, who said he was proud to belong to that body, and was trying to do all he could for its advancement. He would have preferred that the subject had been assigned to some of the society's founders, who have been at the helm and who are working to-day with the same energy. It was owing to that society that scores of minor societies have been established, our own included, which we should bear in mind, and while working for the interests of our own, should still do all we can to further the national society.

Proposing "The Experiment Stations," Mr. O'Mara said: "What the lighthouse is to the mariner, what our policemen and firemen are to our citizens in protection against possible danger, so it may be said the experiment stations are to the florist and nurseryman. The men who delve into the mysteries of nature, for which we have not the time nor the ability—we look to them for advice and counsel when we meet foes or cannot discover the nature of the diseases attacking our plants. A gentleman who stands foremost in the ranks of his profession, an entomologist, is Prof. J. B. Smith, of New Brunswick, N. J."

Prof. Smith, replying, said that a few years ago it would have been a questionable compliment to have been asked to reply as an entomologist, as such an individual was supposed to be afflicted with a malady, not, perhaps, very dangerous, but of a simple nature and of a character that one was supposed not to pay much attention to anything such a one said. It is not many years since an action was brought to set aside the will of Lady Greenville, who was said to have been insane at the time of making it, and the greatest proof adduced was her possession of a collection of insects and her interest in entomology. Even at the present time they were supposed to be afflicted somewhere, or to have a maggot loose, and were called bugologists by some. A popular impression has got about that an entomologist is something appertaining to the individual, hence the term of praise, "There are no flies on him." In many states every package of plants has got to bear a certificate that they are free from all scale, and the certificate has to be given by an entomologist, who therefore becomes important, and gets an invitation to a good dinner. It is coming to be a serious matter, this practice of making laws to cover possible and impossible things. If there is anything wrong in

Before Taking.

Introducing the toast, "Our Night," Mr. O'Mara paid a deserved tribute, saying: "One of the first to put his hand to the plow, and one of the last who will take his hand from it; always ready at the call of duty, presiding officer for a time, one of the brightest stars we have; a grower, a man and a gentleman. I will call upon Mr. J. H. Taylor," who in reply said, among other things:

After Taking.

ANNUAL DINNER OF THE NEW YORK FLORISTS' CLUB.

"On this, our night, the grower, retailer and florist join, meeting only to drop all matters of barter and discussion, and to enjoy an evening when you meet men you have not seen possibly since the previous dinner—guests you hear of or have read about, gentlemen from other states. We welcome them here on our night. We have had many reunions in this room, but the magnificent display of flowers on this occasion surpasses anything we have previously had. In this we show to our guests and ourselves the advancement horticulture is making in this country. It is so rapid a man has all he can do to keep pace with it. Mr. John Thorpe, at one of our recent dinners here, stated that we would see carnations four inches in diameter, though few thought so then. Mr. Thorpe is one of our eminent horticulturists, who looks far into the future. We have carnations here to-night that measure three and one-half inches, and we have seen carnations that would measure more than that."

The "S. A. F. A. O. H." was responded to by Mr. W. A. Manda, who said he was proud to belong to that body, and was trying to do all he could for its advancement. He would have preferred that the subject had been assigned to some of the society's founders, who have been at the helm and who are working to-day with the same energy. It was owing to that society that scores of minor societies have been established, our own included, which we should bear in mind, and while working for the interests of our own, should still do all we can to further the national society.

Proposing "The Experiment Stations," Mr. O'Mara said: "What the lighthouse is to the mariner, what our policemen and firemen are to our citizens in protection against possible danger, so it may be said the experiment stations are to the florist and nurseryman. The men who delve into the mysteries of nature, for which we have not the time nor the ability—we look to them for advice and counsel when we meet foes or cannot discover the nature of the diseases attacking our plants. A gentleman who stands foremost in the ranks of his profession, an entomologist, is Prof. J. B. Smith, of New Brunswick, N. J."

Prof. Smith, replying, said that a few years ago it would have been a questionable compliment to have been asked to reply as an entomologist, as such an individual was supposed to be afflicted with a malady, not, perhaps, very dangerous, but of a simple nature and of a character that one was supposed not to pay much attention to anything such a one said. It is not many years since an action was brought to set aside the will of Lady Greenville, who was said to have been insane at the time of making it, and the greatest proof adduced was her possession of a collection of insects and her interest in entomology. Even at the present time they were supposed to be afflicted somewhere, or to have a maggot loose, and were called bugologists by some. A popular impression has got about that an entomologist is something appertaining to the individual, hence the term of praise, "There are no flies on him." In many states every package of plants has got to bear a certificate that they are free from all scale, and the certificate has to be given by an entomologist, who therefore becomes important, and gets an invitation to a good dinner. It is coming to be a serious matter, this practice of making laws to cover possible and impossible things. If there is anything wrong in

the body politic, there is a law for it. If an insect becomes troublesome, there is a law against it. Talk about the fetich again—the worship of a certificate is worse than anything in the past, and after all the certificate means absolutely nothing. The law requires a certificate that the stock is free. The entomologist, if a lunatic, is no fool. He knows he cannot make a statement of that definite kind. He says he has found no indication of these things. That certificate really says nothing, but it will carry stock into any state in the union, and it leaves loop holes for insects to crawl through. The difficulty has been depending too much on official documents. Illustrating this with a story of one of his colleagues, who, during a rigid quarantine enforced in some of the southern states, passed it with the aid of an official looking document which was not a health certificate, but just a letter from the Smithsonian Institution acknowledging the receipt of some botanical specimens and indorsed with several illegible signatures. He believed the province of experiment stations was to educate the people to the point of protecting themselves, not to rely upon law. The law cannot prove a substitute for that continual care and examination which enables a man to make a success of his calling. It does seem absurd that man, who has conquered large animals when they threatened his existence, has waged successful war, with microscopic aid, against bacteria and micro-organisms, should resort to legislation against things like scale. We want knowledge and education. Our work is along those lines, and tends to benefit all plant growers.

"Our Sister Societies—May They Live Long and Prosper," was ably responded to by Mr. W. N. Rudd, who said there are two kinds of honesty, congenital and acquired, and as he was afflicted with both, with the subject allotted him he was bound to make a comparison, which he proceeded to do in amusing details, but summarized his remarks finally in the assertion that in comparison with the New York Florists' Club other societies were "not in it."

"The Botanic Gardens of America" was coupled with the name of Dr. N. L. Britton, who pointed out our shortcomings in this branch of horticulture and briefly reviewed past attempts to establish an institution worthy of the country. In September of last year, however, this project so long cherished took substantial form by the securing of an appropriation to erect the first building, a botanical museum, and a range of greenhouses, covering about two acres. It would take years to carry out their plans, but he thought when the time came for the managers to make known their wants to the florists' clubs and sister societies, a prompt response would be made. Many things likely to be useful to them the florists threw away, and it would certainly take a great many plants to stock their houses.

"Our Club and Its Effect Upon Society" gave Mr. C. B. Weathered the chance to spread himself as he had long desired. He had been toastmaster on so many occasions, but now at last came the opportunity sought for years. He presented the subject in three aspects—the sordid, the educational or art, and the social side. He lately saw published his very ideal, which took out of his mind altogether the sordid florist in regard to copyrighting our papers. We are taken to task for it, and told the days of locking up the potting shed and propagating house are gone. We are to interest and educate the public at any cost. It may be when you have a beautiful seedling rose, carnation, or anything else, in your whole souled way you will say to others, "Help yourselves; I am not sordid." What man of his ability wishes to write to the papers whole columns, and ask for his pittance per column? And that is my ideal—to sink all meanness and elevate ourselves. The horticultural press will not in that high ideal want copy all to themselves. They will let the other papers know all about it. Now, as to the educational or art side, I remember well several years ago when the New York Florists' Club gave their first exhibition in the Lenox Lyceum. I put on my dress suit to help take the money, but nobody came in. But where the club has shown more for the society side, and which has acted more than the reform notice of the past government has been in handing out those plants to the poor little tots from the tenement houses in the slums of New York. As to the social side, can anyone believe the dinners we have given, that there could not be a semblance of love shown among members in this and other clubs? These dinners have brought us closer and nearer together.

"The Grower" was coupled with the name of Mr. J. N. May, but owing to the lateness of the hour he had taken a train.

"The Wholesalers" was replied to musically with "A Hot Time," and the company was asked to interpret it as they pleased. Mr. Brogan also made a few remarks, and concluded with calling a toast to the brave fellows who went down on the Maine.

"The Horticultural Press" was vouched for by Mr. A. Wallace, who maintained that legitimate criticism was a very essential function of it when matters calling for criticism arose. They had been accused of a lack of dignity, but the press was a part of the trade, and in the trade there was a dignity that no criticism could take away. He, however, was no speaker, and would rather sing a song. The call was unanimous, and he responded with a fine rendering in dialect.

"The Nurserymen" found the best exponent in Mr. F. W. Kelsey, and "The Retailers" in Mr. Theodore Lang.

"Seeds, the Foundation of all Wealth," was responded to by Mr. R. W. Clucas, who said they were a growing source of wealth to the United States, for whereas thirty years ago one of the largest seed houses in New York imported 90 per cent of their entire output, they did not at the present time import more than 5 per cent, and the day was coming when we would be larger exporters than importers.

"Private Gardeners" was given to Mr. A. Herrington, who remarked on the appropriateness of the toast, inasmuch as all the best florists graduated in the school of private gardens, and it appears that all the best private gardeners eventually went into the trade. He appealed for more unity and more harmony than was apparent around New York, with its separate Florists' Club and Gardeners' Societies, and would like to see all working together for mutual good on one common ground.

"The Amateur" was responded to by Mr. Fred H. P. Imbert, Woodbridge, New York.

The usual vote of thanks to the toastmaster and committee, and the singing of "Auld Lang Syne," closed an evening long to be remembered by all present.

Flash Lights.

It was indeed a "hummer."

There was "a hot time in the old town."

The speeches were as flowery as the decorations and as piquant as the dinner.

President Plumb was wreathed in smiles and the "bridesmaids" looked beautiful.

Everything Toastmaster O'Mara said was "Pat"—but he forgot to deliver his address.

Secretary Young did not make any stenographic notes, but he had his typewriter in the next room, which accounted for his spasmodic absences.

Our Charley was right after the "horticultural hypocrites," but let the galled jade wince; our withers are untouched.

Prof. Smith's speech was the brilliant setting in the galaxy of speeches.

Auctioneer Cleary was piqued because he was not called on to make a speech. Never mind, John; you'll have lots of chances this spring.

The wholesalers should have brought a phonograph or hand organ to reply. The orchestra didn't do them justice.

We missed our Philadelphia, Boston and Buffalo friends; but the letters of regret were brim full of wit and humor; they were gems of the first water.

The members of the club are under great obligations to the arrangement committee, Weathered, Taylor and Asmus. Here's to ye. They will undoubtedly apologize for the wine being so old.

Lawrence Hafner was the square man for the square hole. He has not forgotten his old tricks.

The men with claw-hammer coats thought they were the only roses on the bush.

The married men went home early.

All hands satisfied! Auld lang syne! Lights out.

Market Growers' Association.

There were nearly fifty growers present at the regular meeting of the New York Market Growers' Association, held at Leach's restaurant, Tuesday evening, the most successful in the association's history. The president, F. Lehnig, begged to be excused on account of his recent illness and John Birnie was elected president pro tem. After the minutes had been read the following new members were elected: Chas. Zerambo, Aug. Menne, J. Rierckert, of New Durham, N. J.; J. T. Shupp, G. Brown, of West Hoboken, N. J.; A. Bartsch, Union Hill, N. J.; M. Garreau, Jersey City; F. H. Halliday, North Bergen, N. J.; C. Johnson, Newark, N. J.; Louis Schmutz, F. Manker, of Flatbush, L. I.

Patrick O'Mara, the chairman of the legislation committee, reported that he and Mr. Steinhoff had visited Trenton, and had succeeded in having an amendment added to the Skirm bill, exempting florists' plants, flowers, cuttings, scions and buds, which had every chance of passing and being signed by the governor; had also visited Albany, with the same result. Several more growers expressed a wish to take stands, which now makes a total of twenty-seven taken. Considerable discussion took place as to the manner of allotment, and it was agreed to decide by ballot, and to engage the stands for March 26; also to call a special meeting to make final arrangements on March 15, preparatory to opening the season.

The horticultural section of the American Institute will hold an exhibition of novelties and specialties in carnations, and Dr. L. N. Britton will deliver an illustrated lecture on leaves and flowers in the evening.

Our Special Wholesale Report.

There was a fairly active market Monday, succeeded by a period of quiet which lasted the balance of the week. There is an ample supply of everything except carnations, and for a couple of days shipments were lighter than at any time during the season. The indications are, though, that there will be quite enough to supply the usual demand if we continue to get more bright weather. The price has held firm.

Roses are sufficiently plentiful to be affected in price, which has fallen away 25 to 30 per cent. There is a miserable lot of Beauties coming into the market. The average quality is as poor as I remember seeing at any time. Retailers take but little interest in them on that account.

Harrisii are at a discount. Tulips and daffodils are selling better. Violets receive a fair amount of attention. They begin to show signs of wear.

For average prices, see market report.

Various Notes.

Recent visitors were: Mr. W. R. Smith, of the botanic gardens, Washington, on his return from Boston, where he had been to deliver a lecture on "Street Trees" before the Massachusetts Horticultural Society; Alfred Salter, Rochester, N. Y.; "Alf" is looking the picture of health and prosperity; W. N. Rudd, Chicago, Ill.

The Holland bulb men are meeting with adversity this year; two had narrow escapes on the Veendam. Now I hear three or more were on the steamship La Champagne, though luckily all are safe at this writing and on their way from Halifax, where the boat was towed.

Mr. Frank Niquet has received a letter from Miss Maud Adams, thanking him for the courtesy of naming his carnation after her and giving him permission to do so.

Mr. Michael A. Hart, the well-known wholesaler, is moving into the store recently occupied by H. A. Hoffman.

PHILADELPHIA.

Market Resume.

Business was brisk during the past week. The dancing class on Monday, the Mardi Gras dance, and several other balls on Tuesday, together with the usual pre-Lenten rush, clearing up nearly all available flowers by Ash Wednesday. The demand nearly equaled the supply during the remaining four days, except in the case of violets, which are offered on the street at almost any price. Good roses remain firm in price at about the figures quoted two weeks ago. Carnations are a trifle higher, that is, there are more blooms sold at $2 and $2.50 per 100, and even the flowers that have bursted calyces frequently bring $1.50. Tulips and daffodils have sold better than two weeks ago, but the general opinion seems to be that the popularity of bulbous stock is still on the decline. Valley is selling slowly.

What little swainsona is grown seems to sell freely, though not at high prices. It can be made profitable by cutting with the short stems the lower blooms which open first, leaving the long stems until the end blooms open. These short-stemmed flowers are very efficacious in bouquets or designs.

Should the present moderately cold weather continue, preventing over excess of production, it is quite possible that we may have another week of brisk business.

Ladies' Night at Florists' Club.

The most important event of the week was the ladies' evening at the Florists' club on Washington's birthday. The evening was a great success. The ladies came in sufficient numbers to make it clear that they appreciated the club's invitation. So well did the affair go off that I feel sure Mrs. Craig will no longer say that "men have all the good times." Everybody was there—one great man came with his attractive daughters; the son of another great man came with somebody else's daughters, also most attractive; and the way the ladies entered into the spirit of the thing and played shuffleboards and ten-pins was delightful indeed. Even the sturdiest member of the team could only smile with pleasure when some fair bowler gracefully lobbed the ball on his beloved alley. Then there was Mr. Butler, who insisted that the youth of the present day don't know how to enjoy themselves, and proceeded to teach them with a vigor that was most surprising. Altogether, ladies' night was thoroughly enjoyed by all.

Notes.

The competition in store window decoration is fast and furious. One window in pale blue ribbon with yellow daisies and another with violet ribbon and double violets, were arranged the past week. The ribbon is not accidentally mentioned first.

Robert Craig has taken his son, W. P. Craig, into partnership under the firm name of Robert Craig & Son. Meritorious new plants are to be their specialty.

Edward Reid reports a brisk demand for fine carnations.

Henry F. Michell reports an increase in the sale of seeds over this time last year.

The members of the club greatly appreciated the invitation of the New York Florists' Club to their dinner at the Arena. J. W. Y.

TORONTO.

Horticultural Society.

The Horticultural Society on Tuesday next will continue its discussion of last meeting on "Seasonable Seed Sowing," and Mr. Ross, the president, will also dilate on the cultivation and beauties of various hardy climbers. The meeting, however, takes place on the evening of the day of the provincial general elections, and as the returns will be coming in during the evening, it is an interesting speculation as to whether politics or horticulture will be the greatest attraction.

Trade Conditions.

Of course we are all clothed in sackcloth now, and have a liberal sprinkling of ashes every morning (when we shake out the furnace). It seems a great hindrance to business that we should be so constituted as to make it necessary for our good to abstain from all frivolities during this season. However, if we had no Lent, perhaps we should have no Easter, so that after all a change might not be advisable.

The cut flower trade has fallen off

this last week, though there is still something doing—just about enough to keep body and soul together on a fare of salt fish and porridge.

The seedsmen are beginning to feel that spring is drawing near, and they say that indications are good for a rushing season later on; in fact, indications are good for a big trade all round this spring. E.

ST. LOUIS.

Business Continues Good.

Business is still very good with most of our florists, considering that this is the first week of Lent. There seems to be plenty of funeral work, and white stuff had the call the past week. This special line will be about the most active part of the business from now on.

Prices.

Stock is coming in better, and prices are still away up on really first-class stock. For the past week they were as follows: Roses, all the firsts in Meteors, Brides and Bridesmaids, $8; seconds, $6 and $4; La France, Perles and Woottons, $5 and $3; carnations, fancy, Daybreaks, Jubilee, Scotts, Wocher and Eldorado, $4; all whites, $3 and $2.50; some poor ones, $2, but this was the cheapest carnation one could buy.

Bulb stuff is going slower this week. Romans, $2 and $3; good valley, $3 and $4; Dutch hyacinths, $5; daffodils, $4; tulips, $3 and $4; Harrisii, $12.50; callas, $10; freesias, $2 and $3.

Violets are coming in in great quantities now. Home grown are sold as low as 10 cents per 100; Californias, 25 and 35 cents; southern stuff unsalable just at present. Some very fine sweet peas are sent to this market by E. W. Guy, of Belleville, and sell at $2.50 per 100.

Notes.

Visitors in town last week were M. Rice, Philadelphia, and S. S. Skidelsky, representing N. McCarthy & Co., Boston. Both gentlemen report business good in their line.

W. C. Young, who was chairman of committee on special prizes for this year's chrysanthemum show, has resigned.

It is rumored that a new store is to be opened by Ellison & Tesson at an early date in the new Century building, corner Ninth and Olive streets.

The Ude Bros., of Kirkwood, are sending in some of the finest carnations and California violets that come to this market.

Thomas Carroll, who was one of our best carnation growers, is going to California in the spring. Tom is totally blind, and his physician's advice is that a year's trip in that country and away from business cares would do him a world of good. Mr. Carroll's oldest son, George, will go with him.

Telegrams from Seattle to St. Louis say that Mr. Wilson, a florist from St. Louis, died on his way to Dawson City. We do not know whether the deceased was Alexander G. or his brother, George. They left this city on the night of February 2 for the Klondike. They were brothers of James S. Wilson, who is with J. C. Vaughan, of Chicago.

Of Interest to Bowlers.

The bowling club ended the February series Monday night with a good attendance. Mr. S. S. Skidelsky was our visitor and was asked to join in a game. E. Schray was our high man in the three games, with 592; high single score, 222. Kunz, second, with 567; high single score, 216; Beneke, third, with 545; high single score, 199. The series ended as follows: J. J. Beneke wins the medal with 2,299 in twelve games, also the high single score medal with 246; E. Schray, second, with 2,126; C. Kuehn, third, with 2,105. The March series begins next Monday night.

J. J. B.

BOSTON.

Mass. Hort. Society.

A general meeting of the Massachusetts Horticultural Society was called today, to take into consideration the desirability of removing the society's business into larger and more commodious quarters, as the premises now occupied are poorly adapted to the largely increasing business of the society; then again, the society is the owner of one of the largest and most complete botanical libraries in the world, and the present building is not a proper place for such a valuable collection of books, as it is considered nothing more nor less than a dangerous fire trap. A very animated discussion ensued, and the general objection was that the site proposed was too far away from the center of the city, whereas the present building is centrally located and within a few minutes of all the railroad depots. A suggestion was made to pull the old building down, as it was beginning to show considerable signs of decay, and build a new construction eight or nine stories high. This was also laid on the table, but it is evident something must be done in the near future, as the building is giving way in several places. At the close of the meeting a vote of members present was taken. The number in favor of removing was 65; contrary, 105, showing a majority of 40 in favor of remaining where they are.

Exhibition.

The society's weekly exhibition was as follows: W. W. Lunt, Hingham, showed a very fine piece of Cypripedium Lathamianum "by." with nine flowers, for which he was awarded a first class certificate of merit.

James Comley, superintendent for the Hayes estate, Lexington, exhibited a new hybrid plum (Prunus pseudo cerasus var.), with very large double flowers, the individual flowers measuring 2½ inches in diameter. This was awarded a first class certificate. Mr. Comley also exhibited about 100 vases of camellias, Cattleya Trianae, Coelogyne cristata and Cypripedium villosum, for which he was awarded a gratuity. Among his collection was also noted a hybrid azalea showing a somewhat semi-double form of flower of a bright magenta color. This was obtained by hybridizing Azalea indica with the hardy rhododendron, and if it proves hardy will be a great acquisition to our hardy shrubs.

Some finely grown rhubarb was also shown by Mr. Comley, for which he was awarded a gratuity.

Mr. Thatcher, gardener to John L. Gardner, Esq., Brookline, showed six pots of Primula sinensis flore pleno and six pots of violet St. Augustine, very well grown; awarded a gratuity. Mrs. E. M. Gill, West Medford, showed about 24 vases of various cut flowers, among which may be noted Oncidium flexuosum, Lycaste Skinneri, clivias, etc.; awarded a gratuity. Warren Eustis & Son, Belmont, exhibited some fine Pascal celery, for which they received a gratuity.

Lecture.

The usual Saturday's lecture was given by Mr. Wm. R. Smith, Botanic Gardens, Washington, D. C. Subject, "Trees on streets; best varieties for certain localities; how to plant them, and how to care for and protect them after planting, to have good, healthy and well grown shade, as well as fine ornamental trees." This meeting was largely attended and the audience listened with marked attention to the instructions laid down by the lecturer. It is well known that this particular subject could not have been in better hands than Mr. Smith's, as his wide experience in Washington for so many years, where he has had full care of the trees on the streets and roads of the district, enabled him to notice in the most minute manner the varieties best adapted for different locations, soils, etc., also the different kinds of insect life with which they are most liable to be attacked, and the best methods of getting rid of same.

A Banquet.

A few of the leading florists and friends in the neighborhood of Boston gave a complimentary dinner to Mr. Wm. R. Smith Saturday night in the Hotel Brunswick, and a right royal evening was spent. The floral decorations were a work of art, reflecting the greatest honors upon the taste and skill displayed by the well known florist and decorator, M. H. Norton, in whose charge the whole decoration was placed. The flowers and plants were sent from some of the best and largest greenhouses in the state. There was a grand lot of orchids from Oakes

Ames, North Easton, a beautiful lot of Clematis paniculata from Mr. Fred Harris, Wellesley, a quantity of tulips, hyacinths, narcissus, etc., from Warren Ewell's greenhouse, palms and decorative plants from Welch Bros., and other plants and cut flowers from various sources. Covers were laid for about thirty people.

After the dinner had been done ample justice, Mr. M. H. Norton called the guests to order and in a few well chosen remarks introduced the Hon. C. W. Hoitt as president for the evening, and most ably was this position filled. Among the other speakers, besides the guest of honor, were Oakes Ames; J. A. Pettigrew, superintendent of Boston parks; E. M. Wood, Natick; W. W. Lunt, Hingham; J. D. W. French; Lawrence Cotter; E. L. Beard, Shady Hill nurseries; Jackson Dawson, Arnold Arboretum; W. J. Stewart, and Prof. Lewis Elson, who entertained the company with some beautiful music and singing. A most enjoyable evening was spent.

Carnation Exhibition.

On February 26 a large exhibition of carnations was held at the wholesale flower market, which was well patronized by both local growers and those from afar. The new carnation, Mrs. Thos. Lawson, shown by Mr. Peter Fisher, Ellis, Mass., was a star attraction, and with it he won three silver cups. It is certainly worthy of the prizes. Other varieties shown by Mr. Fisher were Morning Star and Klondike, both very good. The Ward cup went to F. A. Blake, of Rochdale, Mass., for a fine vase of Bon-Ton. Messrs. Tailby & Sons, Wellesley, were close competitors. E. G. Hill & Co., Richmond, Ind., made a fine display, including Jubilee, Flora Hill, Salmon Gem, Painted Lady, Arbutus, Armazindy, Psyche, James Whitcomb Riley, and America. C. W. Ward, Queens, N. Y., showed a splendid lot of blooms, including Mrs. G. M. Bradt, New York, White Cloud, Mrs. James Dean, Bon-Ton, John Young, and Gold Nugget. Among other displays were fine flowers of Argyle, Evelina, Opal, Nivea, Buttercup, Daybreak, May Whiteley, Mayor Quincy, Mrs. Frances Joost, Edith Foster, Eldorado, Conch Shell.

A vase of the new pink rose, Mrs. Robert Garrett, was shown by H. Weber & Sons, Oakland, Md., and W. L. Minor, Brockton, Mass., showed his fine new violet "Imperial," a large double, dark, very fragrant flower.

Visitors.

Mr. Clucas, of Clucas & Boddington, New York; E. G. Hill, Richmond, Ind.; C. H. Maynard, representing the American Jadoo Company, Philadelphia.

ROCHESTER, N. Y.

Supply and Demand.

Contrary to expectations, all store men have done a very fair amount of trade during the first week in Lent, and prices of flowers have not varied greatly from former quotations, as had been predicted by the retailers a week ago. Bulbous stuff is very abundant in all quarters, yet but very little is going to waste. Tulips are low priced, but the demand is good. Von Sions are grown everywhere in large quantities, and it is a surprise how readily they are disposed of. Dutch hyacinths are a little slow this week, but fortunately the supply has gradually declined since last Wednesday. Valley is extremely fine at present and none too plenty.

Violets are good and abundant, in spite of the diseased condition of the plants in our vicinity; few places are exempt. Schlegel's plants are among the best in town, producing large-sized flowers on good, long stems, in great profusion; most all of these are disposed of in their own retail trade. At Geo. J. Keller's, our largest violet grower, they are also fine; since January he has been able to pick from 6,000 to 10,000 weekly. The bulk of his plants were not housed until after his chrysanthemums were all gone, and consequently are not yet at their best, though his flowers compare most favorably with any others coming to market; the entire crop is disposed of at wholesale. He also grows excellent mignonette in one of his houses, and is one of the few who considers this flower a well-paying crop here, though the average price obtained does not exceed $3 to $4 per 100.

With the exception of a few small shipments of fancy stock, which always command extravagant prices, carnations have a downward tendency, though few good, serviceable flowers are sold below $1.50 to $2.00.

The supply of roses has increased slightly but steadily since last report. Longer and brighter days have improved quality and quantity of the daily cut with some growers in this vicinity, but many of them are still endeavoring to coax their enfeebled plants into healthier growth, and feel disappointed yet over their experience this winter. Apparently some are successful in this respect, and may have a fairly decent crop by Easter, or shortly after, but the failure of the plants to produce bloom during the dull winter months was a most serious loss, which even with a good crop now cannot be neutralized so late in the season. The decline in price of roses has been very slight and only reached the lower grades. The best quality has not changed yet, and may not go below present figures for some time to come, for the demand is not lessening, and trade prospects for the near future are quite encouraging. K.

CLEVELAND.

Market Conditions.

Business during the first week of Lent has not suffered seriously. There has been, of course, the inevitable drop in social affairs, but between transient business and funeral work, more especially the latter, florists have been kept reasonably busy, and very little stock has been wasted where it has been of good quality. As a consequence, there has been so far no appreciable change in prices, all stock holding up to rates going for the week previous.

Funeral of Ex-Mayor Blu.

The funeral of ex-Mayor Blu, for many years one of Cleveland's most prominent and popular citizens, was notable for the quantities of flowers used, as well as for the great variety employed. His many years of political and business prominence brought forth tributes to his memory from all ranks of society, and as a consequence the work was divided up to a greater extent than is often the case, among nearly all the local florists, some having a great deal of work, and in the aggregate a notable quantity of flowers was worked up.

Club Meeting.

The attendance at the last regular club meeting was rather light, but there was but little business to transact, most of the time being devoted to discussions of the state and national bills for the control of injurious insects infesting nursery stock. There was also some discussion pro and con concerning the merits of Jadoo fibre and liquid, but in this as well as the proposed legislation in the insect and disease matter, no action was taken; in the latter case because there did not appear to be anything objectionable to the florists of this state.

Mr. Carl Hagenburger, of Mentor, brought along a box of his carnation seedlings for the inspection of those present. They comprised a white of good substance, a pink somewhat of the color of Rose Queen, and one very much resembling Daybreak in color. They have all been in cultivation at least three years, look healthy and strong and free from serious diseases. The flowers were all large and of excellent appearance in every way.

Bowling.

After the regular order of business had been disposed of the meeting adjourned to allow the members to bowl. The Chicago game, which pilgrims to the carnation exhibit had imported on their return from that love feast, was the one played. It is a fine game, easily learned as to the operation of projecting the balls from one end of the alley to the other. The real science, however, comes in in the scoring, an operation which allows the display of much mental agility in the juggling of figures. The arithmetical processes involved brought out more discussion than the San Jose scale question or the merits of Jadoo. Next Monday evening, March 7, is given over to bowlers. NEMO.

CINCINNATI.

Cut Flower Trade.

The cut flower trade is more satisfactory than it has been for some

weeks. The demand is good, but not in excess of the supply. Roses are becoming more plentiful, and have taken a slight drop in price, although they are still bringing fair figures. Carnations are also selling well and are far from being a glut. Bulbous stock is not moving so freely, especially lily of the valley and daffodils, although none to speak of is going to waste. Prices on all stock except roses remain about the same as quoted last week.

A fine lot of novelty tulips, grown by George & Allen, find a ready sale at as good a figure as that obtained for the blooms of the more expensive bulbs.

The Florist Club.

The next regular meeting of the Florist Club will be held on Saturday, March 12. The exhibition on this date will be a special carnation show, and it is to be hoped that the out-of-town brethren will contribute to its success as they have done heretofore. Boxes addressed to R. Witterstaetter, Fourth and Walnut streets, will receive proper care and attention.

WANT ADVERTISEMENTS.

SITUATION WANTED.—By practical florist as foreman. First-class rose grower, also cars. mums violets and general stock. 15 years in this country; 5 years in one commercial place; 8 in another; 2 years in present position. State wages paid. Good references; married. Address, B. C. care Florists' Review.

TO RENT.—14,000 feet of glass, consisting of seven even span, north and south houses. Near Philadelphia, Pa. X care Florists' Review.

SITUATION WANTED—By practical florist and gardener, commercial or private; No. 1 rose grower, carnations and violets a specialty; good designer; age 38; best references. Address W. G., 164 E. Main Street, Alliance, O.

SITUATION WANTED—By practical all round florist and gardener fully competent to take charge. First-class references from present and former employer. Disengaged March 15. Address, W. B. A., care Florists' Review.

SITUATION WANTED—By first-class gardener and florist. P. W., care of Florists' Review.

SITUATION WANTED—By a thoroughly practical gardener and florist to take charge of private or commercial place where wages would be commensurate with results; responsible references. Address A. M., care of Florists' Review, 56 Pierce Bldg., N. Y. City.

WANTED—Florist; wages $15 per month and board. Address L. M. Cottle, 622 64th Ave, Oak Park, Ill.

FOR SALE—Large cypress tank holder; ten thousand gallons of water; good as new, as it has been indoors and well painted; only in use 5 years; price, $75.00, f. o. b., Cincinnati. J. A. Peterson, 105 East 4th St., Cincinnati, Ohio.

WANTED, SITUATION—By a florist of 20 years' experience as maker up of designs or general greenhouse work; very best of recomendations. Joe. N. Lawrence, Ottumwa, Ia.

WANTED—An all round man capable of running private greenhouse; one who understands growing carnations and roses. Must be a willing worker and strictly temperate; a permanent place. State wages and give references; a young single man preferred. Dr. S. A. Richmond, Tuscola, Douglas Co., Ill.

SITUATION WANTED—By florist-gardener; private or commercial; fifteen years' experience in all branches; first class references. Address J. M. W., Lansdale, P. O., Pa.

WANTED—A first-class grower who knows enough to run a place on business principles, to buy one-half interest and take full charge; must thoroughly understand the business. If dissatisfied with his purchase any time within one year he can have his money back. For particulars address A. H., care Florists' Review.

Clear Cypress Greenhouse Material.

This *with us* means the best growth of Cypress Lumber and the best grade of that growth; and from this grade all the sap—bright sap, which only experts can detect—as well as stained sap, knots and other defects cut out. Others do not equal our quality if they do beat our prices. It is not hard to see the reason: You can not buy gold dollars at fifty cents each. Experienced growers know that the best is not too good and cheapest in the long run.

Write for Circulars or Estimates.

Lockland Lumber Co.,
LOCKLAND, O.

SITUATION WANTED—As foreman in good florist establishment. First-class rose grower, also palms, ferns, carnations, mums, violets and general stock. Or take charge of a gentleman's good private place; 20 years experience in England and America. Strictly temperate. Good wages expected. Married. Disengaged about March 1st. Good references. PLANT SHIPMENTS TO MICHIGAN.

Agricultural College Postoffice, Feb. 25, 1898.—As there seems to be some misunderstanding regarding Act 137, Michigan Laws of 1897, known as the San Jose Scale Law, in relation to the shipment of plants from without the state, the construction placed upon it by the undersigned, in whose hands the enforcement of the law has been placed by the State Board of Agriculture, is hereby given:

The intention of the law was that it should be limited to nursery stock, and except in one section it is so limited, and although the section of the law relating to the duties of transportation companies under the act does not contain the limiting phrase, we shall consider that the receiving and delivering of greenhouse plants and cut flowers is in no way affected by this law.

In the enforcement of the law we shall only hold transportation companies responsible for failing to comply with the provisions of the law that relate to the shipment of "trees, shrubs, vines and plants commonly known as nursery stock," and greenhouse plants and cut flowers will not be so considered.

I. H. BUTTERFIELD,
Secretary State Board of Agriculture.
W. W. TRINE,
State Inspector of Nurseries and Orchards.

The undersigned hereby certify to the above intention of the law, and approve of the foregoing construction.

C. J. MONROE,
Member and Vice-President, State Board of Agriculture.
CHAS. W. GARFIELD,
Member State Board of Agriculture.
ROBT. D. GRAHAM,
Member of Michigan Legislature, of Legislative Committee of the same in relation to Horticulture, and of the Legislative Committee of the State Horticultural Society; also introducer of the Nursery Law.
R. MORRILL,
President State Horticultural Society, and Chairman Legislative Committee of same.

(The above official decision of the Michigan authorities was obtained by Mr. J. G. Hancock, Grand Haven, Mich., from whom we received a copy.—Ed.)

The key to success is proper ventilation and watering. The key to proper ventilation is the Evans' Challenge Ventilating Apparatus. Works easily, does the work right, built to last, always satisfactory. No toy imitation but a machine to do its work and do it well. Much the cheapest in the end. BALTIMORE.

Trade Conditions.

The retailers have scored another busy week. Society's last big affair, the bachelors' cotillion, was given Monday evening, and the great demand for dinner decorations, bouquets and the many other floral requisites to social events is now at an end. Shrove Tuesday and Washington's birthday falling together caused trade to be exceptionally brisk. Thus far the advent of Lent has given little material check to general business, and the outlook for a continuance of these good times is very bright.

Stock.

Stuff, though more plentiful than it has been, is not quite equal to the demand. Mr. Scott, manager of the Florists' Exchange, reports a great scarcity of carnations, with violets correspondingly plentiful. This latter fact is quite evident by the price, the best only bringing 40 cents per 100. The fakirs also flood the streets with an abundant supply of fresh stock, which ordinarily they seldom handle. At the markets can be seen bulbous stuff in profusion. In fact, this week growing plants seemed to be the chief article for sale. Everybody looked busy, Miss Stoel especially so, although it is nothing new to see a crowd about her stall.

Among the list of successful competitors at the carnation convention, the writer notes with no small amount of pride and pleasure the familiar name of H. Weber & Sons. Hurrah for Maryland! and our friends at Oakland, who so nobly won new laurels for our state. C. F. F.

HUNT'S REVIEW OF THE CHICAGO MARKET.

Lent is here! So is everything else—liable to stay with us, too. The same "old, old story;" not of love or of peace and happiness, but of fierce unrest, of sweating under the collar and of search for some spot to unload surplus stock. This thing of unloading does not refer to trashy stuff, but the best. In fact, there is little trash coming in. Most stocks are good—above the average.

The market has been and is and will be long on colored stock of all kinds. Of course, there have been and will be short periods when some particular variety may not be at hand, but until late in the day most lines remain unbroken.

White roses, carnations and all that acompany them in "making up" seem to have the call, and demand so far has about kept apace with receipts.

Violets, while ruling low, have gone fairly clean at all times, and as the voice of the fakir is now heard in the land, will probably keep moving at price that really is fair, season considered.

The expected decline in price has been general and followed real values closely, and there is little doubt but that out-of-town buyers have had all the benefit realized by the local ones.

The period of depression now on is not expected to reach the proportions attained for the past several seasons—all or much will depend on the weather.

Always mention the Florists' Review when writing advertisers.

CARNATION GENESEE.

Mr. D. B. Long, of Buffalo, is nothing if not original, and the 12-page circular of the new white carnation Genesee, of which he has sent us a copy, fully sustains his reputation in this direction. An excellent feature is the series of views showing the appearance of Genesee on the bench at various seasons of the year. The detailed reports of the well known growers who tested Genesee last year are certainly very flattering.

ANOTHER SWINDLE.

It is high time to stop the seed swindle perpetrated by the department of agriculture. A Kansas man says he wrote to the secretary of agriculture for some tobacco seed and carefully specified that he wanted Battle Ax, Climax or Star plug, and was put off with the silly excuse that they were giving out nothing but fine cut this year.—Chicago Times-Herald.

HENDERSON, KY.—Le Roy Posey has sold his interest in the Ohio Valley Greenhouses to his partner, W. R. Conover, who will continue the business.

Florists' Review....

PLANT SHIPMENTS.

Messrs. Patrick O'Mara, John N. May and Charles H. Allen, representing the New York Florists' Club, were given a hearing before the senate committee in Albany, N. Y., on Wednesday, Feb. 23, on senate bill No. 426, amending the laws of 1893 and 1895, entitled: "An Act in relation to agriculture, etc., relative to the prevention of disease in fruit trees, and pests that infect the same." The nurserymen were also represented before the committee and after considerable discussion both before the convening of the committee and afterwards, an amendment offered by the committee, as follows, was accepted: "Section 5. That the provisions of this act shall not apply to florists' greenhouse plants, flowers and cuttings commonly known as florists' stock." The bill will be reported with this amendment, and will undoubtedly become a law.

An effort should be made and at once by the florists throughout the country to have uniform legislation on this subject. As pointed out in the previous report of the committee, which has been published, they are of the opinion that the vice-presidents of the S. A. F. in the various states should take the matter up at once. In states where laws are already in force bearing upon this subject, the florists should unite in a consultation with the experiment stations in an effort to have the laws amended, or at least have them interpreted as exempting florists' stock. The example set by the Michigan authorities can be cited because they have notified the transportation companies that florists' plants will be received in Michigan without certificates and without examination, provided that the experiment station is notified by the consignor and the consignee, stating that florists' plants are being forwarded. The example set by the legislatures of the states of New York and New Jersey and also by the house committee in Washington in accepting amendments excepting florists' stock may also be cited to strengthen the position of the florists. Every effort should be made to have the laws made uniform throughout the several states.

PATRICK O'MARA.

New York.

URBANA, ILL.—The boiler house at the greenhouses of Florist Yeats was destroyed by fire Feb. 17, and much damage was done to greenhouses and stock. There was no insurance.

A. J. BALDWIN, Newark, Ohio.

Extra select stock at Kennicott Bros. Co., Chicago. All flowers in season at lowest market rates.

SIMMONS'

New Light Colored

CARNATION

Mrs. S. A. Northway

We introduce this variety with even more confidence than we did Portia, Silver Spray, Tidal Wave, Daybreak, Rose Queen, or J. J. Harrison, knowing that it will become as great a cut flower variety as any of the above. Plant of strong, free growing habit, entirely free from disease or rust; large round high built flower with perfect calyx and extra strong and long stem. Color a beautiful soft shell pink becoming almost white when fully open.

Orders booked now and filled in rotation. We shall commence to ship soon after Jan'y 1st. Price, $10.00 per 100; $75.00 per 1000.

Geraniums. Md. Bruant, Md. Jaulen, Fleure Poitevine, J. Ricaud, and J. Sallier, 2¼-in. pot plants, $5.00 per 100. Rooted cuttings, $3.00 per 100; $25.00 per 1000. Our superb stock of all the finest sorts, 2¼-in. pot plants, named, $25.00; unnamed, $20.00 per 1000. Rooted cuttings, $12.50 per 1000.

Fuchsias. A grand lot of summered-over stock in small pots that will make early bloomers, $3.00 per 100.

All Rooted Cuttings Cash with Order.
Our Price List describes many other fine plants. Send for it.

W. P. SIMMONS & CO., - Geneva, Ohio.

Two Great Sports.

Carnation Victor.

Undoubtedly the best Pink Carnation in commerce and certainly the most prolific bloomer, perfectly healthy and of vigorous growth.

Rooted cuttings now ready, $4.00 per 100; $35.00 per 1000. Come and see this Carnation growing.

Chrysanthemum Pennsylvania.

The finest yellow for cut blooms or exhibition purposes ever produced. Plants ready March 15, $5.00 per doz.; $35.00 per 100; $250.00 per 1000.

HUGH GRAHAM,

104 South 13th Street, Philadelphia.

FIREFLY!

A Rust-Proof Carnation for Business.

Bright scarlet and Positively RUST PROOF and as productive as Scott. Rooted cuttings, Feb. 15th, $10 per 100, $75 per 1000. Send for descriptive list of Firefly and fifteen other novelties of 1898, as well as fifteen varieties of '97; also older standard varieties.

Geo. Hancock & Son, Grand Haven, Mich.

HEATING.

In writing about heating one of the most important points is often overlooked, namely, the position and size of returns for the various sizes of flow or feed pipes and coils. I have seen some excellent systems not working satisfactorily and where the trouble was due alone to lack of capacity in the returns, or to this cause and insufficient fall in the pipes. W. H. R.

In replies to general inquiries it is not practicable to state definitely or in detail the arrangement of mains and connections, so much depends upon the position of the boiler, length of mains, nature of connections and fittings, friction, exposure, and the ultimate amount of surface to be attached to the main, etc., but under ordinary favorable conditions, in connection with a low pressure steam heating system, in which the condensation returns to the boiler by gravity, I find the flow main having an internal diameter in inches equal to one-tenth the square root of all radiating surface to be attached, in feet, gives good results, and the return having from one-half to three-fourths the area of the flow, according to length and friction conditions. The pipes should all have a grade of not less than one per cent to give best results.

HENRY W. GIBBONS.

New York.

NEW CANNAS.

We have received blooms of the new cannas Duke of Marlboro, dark red, and Rosemawr, pink, from the Conard & Jones Co., West Grove, Pa. Both are very striking in color and the heads of bloom were large and individual flowers of fine form. They are certainly promising varieties.

The New Carnation, Cerise Queen

READ WHAT THOSE THAT ARE GROWING IT HAVE TO SAY:

Mount Greenwood, Ill.
MR. FRED BREITMEYER,
Mt. Clemens, Mich.,

Dear Sir:—In reply to yours for our experience of Cerise Queen, will say that under our treatment the color, form and substance is all that can be desired; we have also found it a very free and continuous bloomer and have never found a bursted calyx the whole season; it is a little weak in the stem, but we lay that to the poor place in which it is growing, also we think one should be careful and not overfeed it, as it does not need it, but produces a fine flower under ordinary care.
Yours truly, C. W. JOHNSON.

H. DALE, Cut Flower Grower,
Brampton, Ontario.
MESSRS. J. BREITMEYER & SONS,
Mt. Clemens, Mich.,

Gents:—The plants of Cerise Queen which you sent me last spring for trial have done well; the flower is of very pleasing color, stem medium length, 15 to 18 inches; habit of plant good. I shall plant it again next year.
Yours truly, H. DALE.

DAILLEDOUZE BROS.,
Flatbush, Brooklyn, N. Y.
JOHN BREITMEYER & SONS,
Mt. Clemens, Mich.,

Gents:—We have a few plants of your No. 16, Cerise Queen, on trial; the flower is medium size, but fine color, in fact the only fault we find is its dwarf habit; we should like to grow some for side benches, as we believe it far superior to Tidal Wave for that purpose, and should make a commercial variety, but not high priced. Please give us your best price on 1000 rooted cuttings.
Very truly yours,
DAILLEDOUZE BROS.

GEO. A. RACKHAM, Wholesale Grower,
Detroit, Mich.
J. BREITMEYER & SONS,
Mt. Clemens, Mich.,

Dear Sirs:—In reply to yours asking as to my success with your No. 16, Cerise Queen, will say that I consider it the ideal Carnation of its type, very productive, continuous, stiff stem, of medium length, and holds its color longer on the plant than any Tidal Wave ever grown. I shall plant a house of it, if I am able to procure the stock.
Yours, GEO. A. RACKHAM.

Copy of a Letter--- My order for 1000 cuttings, which is a big one for my small place, speaks louder than words. W. N. RUDD.

We predict **CERISE QUEEN** is the coming Dark Pink Commercial Carnation.

ATLANTA, GA.

Rapid strides have been made during the past year, both in the West View grounds and greenhouses. The former bids fair to be one of the attractions of the South, while the choice stock being grown by Mr. Burford is highly creditable to him. Mr. McBurney, the genial manager of the company, informed me the demand and supply of stock has never been better than during this season, the crops particularly of Beauties, Perle, Bride and Bridesmaids for Easter being of great promise. Kaiserin is quite a favorite and will be grown even more extensively. In carnations, Flora Hill and Mrs. McBurney are simply grand. I have not seen larger or better blooms elsewhere. I noted a wire collar is used to support the roses, especially Beauties, in lieu of tying. It is easily applied and can be used over and over again. Asparagus and smilax are grown by the yard; fine stock.

The C. A. Dahl Co. are also cutting some choice stock. They report an increase in the line of decorations and will be on hand at Easter with big commissions, judging by present returns.

Wachendorff Bros. report a good season. They have a heavy line of spring stock; one of their leaders. W. M.

AMERICA'S OLDEST FLORIST.

The Daily Times, of Troy, N. Y., in its issue of Feb. 10 gives a very interesting sketch of the life of Louis Menand, of Albany, N. Y., who is undoubtedly the oldest living florist in America, having passed his 90th year. It is pleasing to learn from this report that our veteran still enjoys good health and is wonderfully active for a man of his years.

IMPORT DUTY ON IMMORTELLES.

By a recent decision of the Treasury department at Washington, acting upon an appeal, immortelles were classed as a non-enumerated manufactured article, with import duty at the rate of 20 per cent. ad valorem.

DES MOINES, IA.—The J. M. Clark Mfg. Co. has been incorporated with a capital stock of $10,000, to manufacture a shipping case for cut flowers.

Rooted Cuttings **Ageratum Monstrosa.** A dwarf variety with blue flowers of enormous size. The greatest improvement of the age in this popular flower. 40c. per doz. by mail, $1.50 per 100 by express. **Vinca Var.** $1.00 per 100. **Salvia Splendens,** $1.00 per 100. **Harrisii Lilies,** surplus stock, just right for Easter, in 5½ and 6-inch pots. Out of pots $18.00 per 100.

Horticultural Architect and Builder

Get my Prices on Everything Needful for Erecting or Repairing of Greenhouses.

NO, I don't deal in masonry materials, but in everything else entering into the heating, ventilating, building or repairing of greenhouses.

ORDERS are filled as promptly and with as much care in small lots, as well as for large. No order is too small and none are too large.

PURLINS of strong angle iron, of wrought iron pipe, or clear cypress; all styles, all kinds. Cast iron foundation posts made to last. Putty made especially for greenhouse purposes.

QUESTION me about everything regarding heating, ventilating or building greenhouses. Am always ready and willing to advise with you as to all the above.

RAFTERS of wrought iron, welded at eave joint in one solid piece, or of wood strengthened at joints with a cast iron bracket, or of clear cypress of any size or style desired.

STEAM Pipe, Fittings, etc., of all kinds as well as for Hot Water, cast or wrought iron. "Standard Iron Construction" for greenhouses is the best, but if you will not have it, let me figure on anything you may want.

TELL me your wants relating to the heating, ventilating, building or repairing your greenhouses. I can help you.

Thos. W. Weathered's Son,
141 Centre Street, New York.

Use Economy and Make Your Own Pots

THE COW MANURE POT is the best in the world for young plants. For bedding and sending of plants it is the best thing ever invented. The cow manure forces the plant and makes it healthier. You do not need to disturb the roots in getting them out as you do in the clay pots. It is especially recommended for the sending of plants, as the plant does not have to be taken out of pot. For bedding all you have to do is to squeeze the bottom of pot and set out in bed. It never stays the plant, it holds the moisture better, especially if you have a dry summer. The pots stand watering in greenhouse and hotbed. Every gardener needs one of these machines. **Single machine, 2-in. pots, $4.50. Double machine, 2 and 3-in. pots, $5.**

Machine weighs about 5 pounds.

AN UNPARALLELED SUBSCRIPTION OFFER.

EVERY one to whom this issue of the FLORISTS' REVIEW is addressed, and who fills out, signs and returns the accompanying subscription blank, accompanied by $1.00, within 30 days from date, will receive not only the FLORISTS' REVIEW for one year but also a certificate entitling him to the earnings on one-tenth of a share of stock in the company formed to publish the paper. The shares will be of a par value of $10.00 each.

Why do we make such an unparalleled offer? It is very simple.

You will have an interest in the success of the paper.

You will see that you can buy everything that you want to just as good advantage from advertisers in the FLORISTS' REVIEW as elsewhere and at the same time benefit yourself by increasing the earning power of your certificate.

This mutual arrangement cannot fail to bring to the paper a heavy advertising patronage, and as a result the stock represented by your certificate will earn good dividends.

And the more you buy of advertisers in the FLORISTS' REVIEW (always mentioning the paper) the larger your dividends will be.

You will get a better paper than has yet been published in this field, and a share of its earnings. Please let us hear from you by early mail.

FLORISTS' PUBLISHING COMPANY,

530-535 Caxton Building, - - - CHICAGO, ILL.

Following is the form of certificate we issue to subscribers:

$1.00 **$1.00**

The Florists' Publishing Company, Chicago.

This Certifies that _____ of _____

_____, is entitled to the annual dividends on one-tenth of a share (par value of each share $10.00) of the stock of the FLORISTS' PUBLISHING COMPANY, of Chicago, Ill., that has been placed in my custody as Trustee, so long only as

_____ shall remain a paying subscriber to the FLORISTS' REVIEW.

This certificate is transferable only to _____ successor in business, and then only on application to the undersigned. Dividends will be made of net profits on the first day of January of each year.

Certificate holders are reminded that by confining their purchases to those who advertise in the FLORISTS' REVIEW (always mentioning the paper when writing) they will greatly enhance the earning power of their certificates.

Buy to best advantage always, but, everything else being equal, give the preference to those who advertise in the paper in which you have an interest.

Witness my hand and seal at Chicago, Ill., this _____ day of _____, 189'

FLORISTS' REVIEW

COPYRIGHT, 1898, BY
FLORISTS' PUBLISHING CO., 520-535 Caxton Building, CHICAGO.

Vol. 1. CHICAGO AND NEW YORK, MARCH 10, 1898. No. 15.

ADIANTUM MUNDULUM.

The subject of our illustration is one of the many interesting and useful forms of Adiantum cuneatum, and is correctly termed Adiantum cuneatum mundulum. The varietal name, which signifies neat, is well applied in this case, the plant being of dwarf and compact habit, and is better adapted for small ferneries than as an exhibition plant.

The fronds of A. c. mundulum are shorter and rather stiffer than those of the parent form, not often more than nine or ten inches long, very dark green and closely furnished with narrow, wedge-shaped pinnae. In general outline the fronds are deltoid, and when well matured they possess sufficient substance to be useful in cut flower work, where a small frond is required.

A. c. mundulum comes true from spores, and also germinates freely, the spores being produced abundantly on old plants, and it flourishes under the same treatment as A. cuneatum, thus being by no means difficult to manage.

Nicely grown plants in 3-inch pots are very short and bushy, and may be used to advantage where A. cuneatum proves too tall, and if the plants are not soft when used will possibly last a little longer than the last named fern, under the same conditions.

A. c. mundulum is of garden origin, and although in cultivation since 1879 is not frequently met with in the trade, in fact, seems scarcer now than it was ten years ago, no doubt owing to the greater demand for ferns of more endurance than is found among the maidenhairs in general. W. H. TAPLIN.

Adiantum Mundulum.

ACACIAS FOR FLORISTS.

Strolling along Broadway recently I reached the store of J. H. Small and before the window stood an individual looking intently at something there displayed. It was your New York correspondent and the object of interest to him was a bunch of the beautiful Acacia pubescens. His thoughts were reminiscent, toying with past visions of acacias in Kew Gardens in the lovely temperate house there which was not too hot for the ladies, but that is another story.

Having spoiled the reverie I was quietly made the victim of a request to say something about this and other acacias likely to be useful to florists here. It is strange they have not come into prominence before, as acacias, both as pot plants and in a cut state, are commonly seen throughout the winter and early spring months in London, Paris and other European cities. Anyone on this side in search of a charming novelty will find one of great attraction and I think of certain profitableness in the acacias.

The acacia family is an extensive one and widely distributed through South America, Asia, Africa and Australia, numbering several hundred species, but those most useful to the florist are Australian kinds, of which eight or nine species are commonly grown in gardens on the other s de

where they prove of easy culture, and extremely floriferous. They come within the category of what are known as hard wooded plants, but are not difficult subjects to handle like heaths. In their native land they are shrubs and trees, ranging in height from six feet up to sixty, according to kind.

Some of those that are naturally dwarf are so amenable to cultivation that they can be produced in most attractive shape in 6 or 8-inch pots, tiny bushes literally aglow with blossoms. Others of more rampant growth can best be recommended to grow for cutting only, combining as they do profuse blossoms with foliage as elegant as that of the choicest fern, so graceful in fact that if they never flowered at all one would be tempted to grow them for the beauty of their leaves alone. In the matter of leaves the acacia family and even the limited few here selected show remarkable distinctive variations. We see the true acacia leafage in A. pubescens, A. dealbata and others. Some, however, have no leaves at all, the functions of these being served by what botanists call phyllodes as in A. lineata and A. armata, while several others have only winged growths on stems and branches and all these diverse characteristics are represented in the few kinds here enumerated. Taking first of all those best adapted to grow and sell as

Pot Plants.

I would head my selection with Acacia Drummondi, a real gem and grown by the thousand in some European establishments. This has true compound leaves of a deep green color, has a natural stature of about ten feet, but can be grown as a dwarf bushy plant, producing from the axils of the leaves all along the shoots drooping cylindrical spikes of lemon yellow flowers as showy and lasting, as they are graceful and attractive. A. armata is another species that comes into the London market by the thousand, neat plants in 6-inch pots, jeweled all over with golden balls. It has little oval, oblong leaves, the tiny flowers massed in globular heads as round as a ball each on a little short stalk and hundreds of them on a plant of the size above mentioned. It has the additional merit of being delightfully sweet-scented.

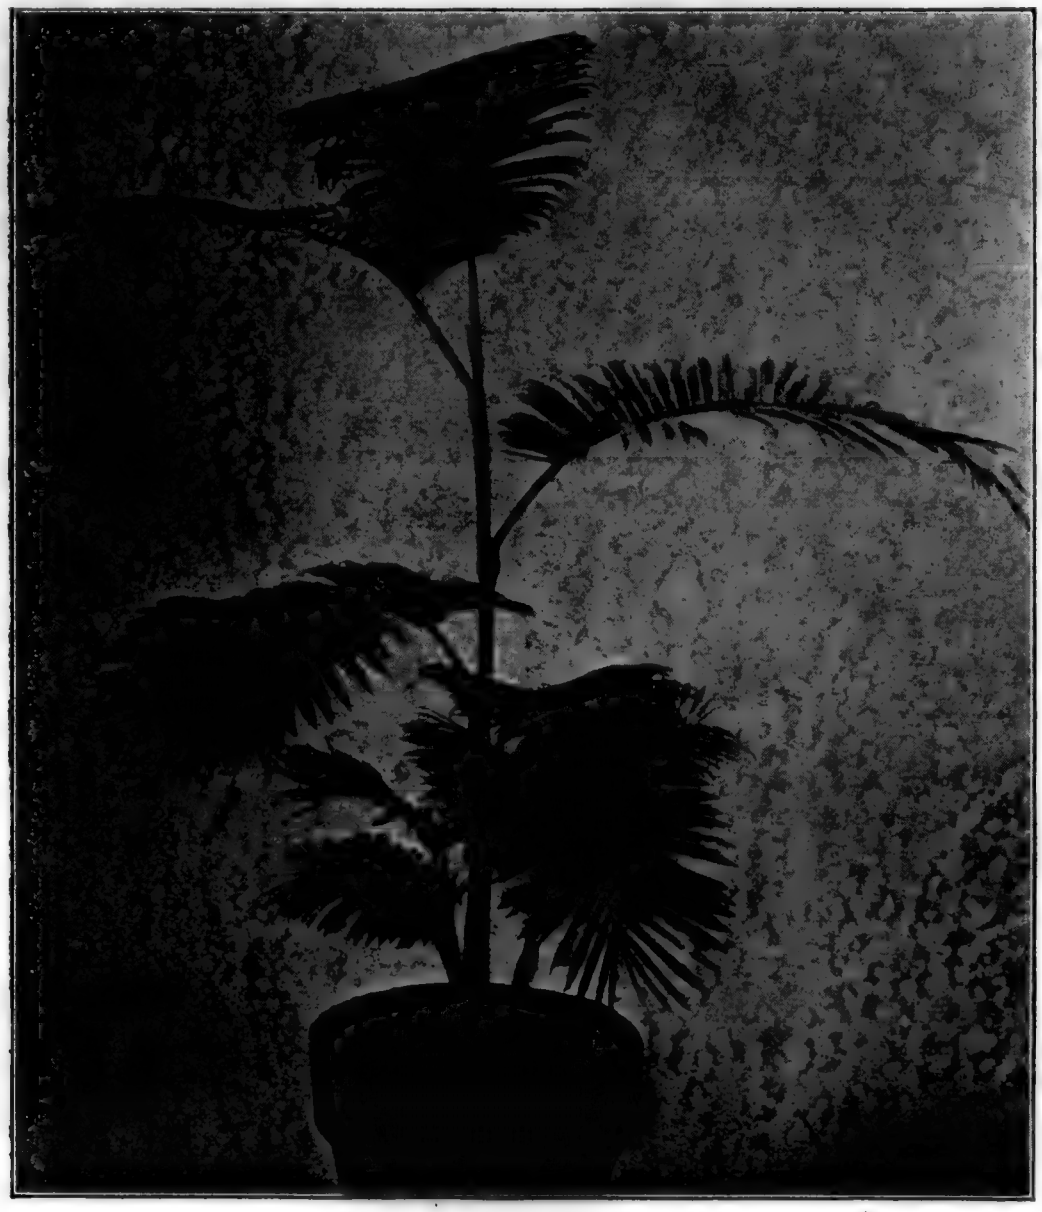
A. lineata is another species that finds much favor for pot culture in private gardens on the other side, and it holds its deserved popularity by reason of its free blooming character as it always flowers freely, even though small, added to which it comes in about Christmas directly after the chrysanthemums. It makes a slender, graceful plant, has linear, grass-like leaves and deep yellow flowers in clustered heads on stems thrown out from the axils of the leaves. A. platyptera is another pretty species that has great capabilities as a pot plant and merits a place in the most exclusive selection. It differs, too, from all others noted here in that the plant has no leaves or anything resembling them, their place being taken and their functions served by curious winged growths that are concurrent along the stem and branches and varying from a half inch to one inch in breadth. It flowers in early winter, the flowers yellow borne in a close head on a short stalk.

A. cordata, another charming species, has distinctive features of its own, and is as desirable as any of the preceding. It takes its name from the heart-shaped phyllodes that freely clothe the slender branches while it flowers with wonderful profusion, even young cutting plants flowering freely after the first shift into 2½-inch pots. Its flowers are pale sulphur yellow, disposed in flat heads. I might enumerate others that can be made to flower in small pots, but here are enough and these the best of the genus. Another little selection must be made of those which growing larger before they reach the flowering stage are best adapted for use as

Cut Flowers.

Of course some of our friends stand aghast at the suggestion. Who wants such stuff? There is a market and a pretty large demand for it in other countries and "history repeats itself." A. pubescens, which suggested these notes, comes into this category. It is a small tree, growing six to twelve feet in height, but if accommodated with a large pot or a small tub, it can be flowered with the greatest freedom; can be cut in long, graceful sprays of fern and flower, united, as it were, and this cutting serves to give it what it would otherwise need, a good annual pruning.

Possibly the most beautiful of all is the silver wattle tree of Australia, A. dealbata. It would be hard to find another tree such a perfect embodiment of grace and beauty. Its compound leaves consist of ten to twenty pairs of pinnae, are of a silver-gray color, while from the axil of each leaf comes a long branched raceme bearing from fifteen to thirty round heads of rich yellow flowers. This acacia has been largely planted at Cannes and elsewhere along the shores of the Mediterranean for its beauty, and so successful has it been that quite an enterprise has sprung up and its flower laden branches are cut and marketed in all the principal cities of Europe. Something similar should be possible in some of the southern states below the region of severe frosts. In its native home the silver wattle grows as high as 150 feet, but it is so amenable to treatment that I have had it flower profusely each year just trained to a pillar in a conservatory, the plant being pruned hard back each year after flowering.



A. Riceana is another lovely species quite different from the two preceding it in that it has no true leaves. It has been aptly likened to a weeping willow, having that loose, pendant character of growth, its slender shoots clothed with long, narrow phyllodes disposed in clusters, while from their axils depend the flower racemes bearing round balls of yellow blossoms like strings of beads. A. pulchella, though last, is not least, as it makes a beautiful plant in a 12-inch pot, has true fern-like foliage and bright yellow flowers borne most profusely. It may be thought there are too many kinds for the commercial florist to grow, yet all are beautiful, and Nature was lavish in her original distribution of them, since she gave Australia in the neighborhood of 300 distinct species, from which vast number the selection here given is chosen, these having been in cultivation for a period varying from twenty years to a century or more. A few remarks as to their

Cultural Requirements

will possibly anticipate a request. Though acacias belong to the family of hard wooded plants they happily do not present such difficulties as have to be surmounted in dealing with most of their kindred, in short, they are easy to handle, of vigorous growth, and if by any chance they get a slight neglect the consequences are not disastrous. They can be raised from seed or struck from cuttings, this last being the usual practice.

Immediately after flowering, if the plants are pruned in, they soon break again, and when the shoots are about three inches long they may be made into cuttings. Although not absolutely necessary, it will be safer to the inexperienced, especially, to take off the cuttings with a heel of the old wood. They will not bear the exciting conditions of bottom heat, so should be inserted in pots or pans, these stood on a cool bottom in a temperature of about 55 degrees and covered with a bell glass to check evaporation. They will root in about six weeks, and when well rooted should be potted off into 2½-inch pots, using open loamy soil, shading slightly till established, but gradually inuring them to full sun and using the syringe freely when conditions suggest its advisability. Pinch them as they grow, shift into 4-inch and later into 6-inch pots, as they need it, and give abundant supplies of water at their roots at all times. Towards the end of summer syringe less and give all air possible to solidify and ripen the wood.

The strongest plants may be flowered and disposed of the following spring, but those a little weak might be wintered in a temperature of about 45 degrees and shifted on into 8-inch pots the following spring. Those that it is desired to flower will quickly respond to the stimulus of a little extra heat, but if they are placed in a house kept at 50 degrees by night that will

Calamus Ciliaris.

suffice to bring them out in a few weeks. This, of course, applies to those to be grown and sold as pot plants. The stronger growing kinds had best be kept growing on, shifting as desirable till they are in 12-inch pots or tubs, ripening the wood well at the end of the second summer. These will flower the following spring, and after treatment becomes a matter of simple routine, though it may be well to mention that these large plants may easily be kept in the open air for the summer months, putting them outside when their season's growth is well advanced. These large acacias for cutting may be particularly commended to florists who have glass and grow a quantity of the material they use, while others who make a specialty of pot plants for market would assuredly find the dwarf growers a remunerative article if well done.

A. HERRINGTON.

CALAMUS CILIARIS.

The rattan palms, or calamus, include twenty or more species of slender growing and very graceful palms that are found in a wild state in various portions of the tropics, chiefly in India or the East Indies.

Some of the species become climbers in their native country, and are said to attain a length of stem of 200 to 300 feet, and to trail over the tops of forest trees in Java and Borneo, but the subject of our illustration is one of the smaller growing species, and not likely to outgrow its accommodations for a period of several years at least.

Calamus ciliaris is a particularly graceful palm in a young state, having a slender, reed-like stem, and finely divided pinnate leaves. The leaves of this species are light green, the pinnae narrow and arranged very closely on the stem, and the foliage is rather soft to the touch, owing to its being covered with short, hair-like bristles.

C. ciliaris is essentially a warm house palm, flourishing in a temperature of 70 to 75 degrees, with abundant moisture, its tropical jungle habitat giving us some idea as to its cultural wants.

The leaves of this species being rather thin in texture, it is liable to attacks of red spider unless freely syringed and watered, but when well-grown is very attractive, and while not adapted for all trade purposes is a valuable and effective plant for special occasions.

C. ciliaris suckers freely around the base, and by careful handling these suckers may be removed and established, but it is necessary to keep them rather close and warm for a time in order to encourage the new roots, and also to be careful that they are not allowed to get too dry.

W. H. TAPLIN.

SOIL FOR BENCHES—CARNATIONS.

What can I use instead of sod for the bottom of rose benches? Sod is hard to get. Is there anything else as good?

What soil should be used for carnations? Should it be different from that for roses? My carnations have grown tall, but have bloomed hardly at all, notwithstanding they have shown thousands of buds all winter.

J. R. E.

The question has often been asked and has occurred to all of us. What is the best way to prevent the new soil from dropping through the spaces between boards of rose and carnation benches, as considerable will do if the boards are from a half to three-quarters of an inch apart, which they should be for rose growing. This question was asked, and answered from the platform at the convention of the S. A. F. years ago in New York by John H. Taylor, who said he put nothing on the bottom. The small quantity that fell through he could afford to lose, and that is largely true. There is, however, some waste about it, and I have always found that you could pick out of your compost enough soddy material to lay over the cracks before you wheeled in the bulk of your compost. On carnation benches I always take in a few barrow loads of rotted manure and distribute that over the cracks.

Carnations are grown in widely different textures of soil. On Long Island, where they certainly grow grand carnations, the soil is a yellow sandy loam. Lately I have seen superb carnations grown in the fat prairie soil of Illinois, but they added to that soil some clay and lime. In the neighborhood from which I write there is a great diversity of soil, some light sandy loam, some heavy loam almost a clay, and yet another, a brown light loam, largely impregnated with lime. Without any claims to analysis of soil in the least, I know enough to say that color and texture do not decide quality of soil, and it may contain ingredients that it would take a chemist to demonstrate. It is certain that carnations do not all do equally well in the same soil, and to classify all the varieties to their respective soils would be a long chapter, even if it were possible. One example I can give: Daybreak, that yet glorious variety, will produce its finest flowers and stems in a heavy soil, while the well known Scott does much better in a light loam.

There must be something else the matter with J. R. E.'s carnations besides the soil. If they have grown tall, "and thousands of buds" are on them, it must be temperature or water that is at fault, and then again there are a few varieties which have been sent out within a few years heralded as something wonderful, which as producers have been perfect frauds, always promising a wonderful crop, but which is never realized. Bridesmaid is an excellent type of these impostures, which reminds you of Pope's immortal words: "Hope springs eternal in the human breast; man never is, but always to be, blest." W. S.

AN INDIANAPOLIS STORE.

We present herewith three views in the store of the Bertermann Floral Co., Indianapolis, Ind. No. 1 shows part of the ice box, counters and wrapping tables. The door in the corner leads to the bookkeeper and the private office. To the left is a small elevator to the basement, used for bringing up the flowers. The show windows are open to the store, giving plenty of room for decorative effects.

No 2 gives a view toward the mirror and an easy stairway to the basement. In front of the mirror is the desk room for the use of customers in writing cards, etc. At the left two high arches lead to the design room and conservatories.

No. 3 looks toward the conservatory in the room for designs, baskets, vases and jardinieres, swinging doors connecting the two. A long table is used for displaying designs, etc., when selling. At the left is a door leading to the private office.

No. 1.

GLIMPSES OF THE STORE OF THE BERTERMANN FLORAL CO., INDIANAPOLIS, IND.

DISEASED ROSES.

I have a house of mixed roses, Bride, Bridesmaid, Kaiserin, Perle and Sunset. The two last named varieties are badly affected with club root or something of that nature. The leaves turn yellow and the edges look as if scalded. The roots are swollen, dead or brown, and the plants die. What is the probable cause, and is there any remedy? R. W. S.

"R. W. S." does not say what he has been keeping the night and day temperature at, but inferring that Bridesmaid and other varieties have been satisfactory the temperature cannot be far wrong and would not account for the present trouble with the Perle and Sunset. It may be club root, but without seeing the plants and roots I can't say.

What to do at the present moment is of most consequence to R. W. S. I would say that unless the plants are in a very bad state I would leave them in the bed and get what flowers they will produce between now and June 1st. It is wonderful the way plants of all kinds pick up on the approach of spring, and roses that have struggled along during the dark days of winter may now throw off disease with the genial conditions that the advance of the season brings. Don't attempt to propagate from this stock. Two lbs. of quick lime dissolved in 30 gallons of water, allowed to stand till it is clear and sprinkled on the beds, will do no harm and may help the roots.

W. S.

FORCE PUMP.

A subscriber asks if The Review can recommend a force pump that can be used with hose attached to distribute liquid manure and would not get clogged up easily by the manure.

If but one house is in use the force pump could be fixed permanently in the shed and would be easier to work. If to be portable and carried to different houses the same arrangement would not do, but most force pumps are made in more than one style. All first-class seedsmen advertise one or more makes. There is Henderson's "Success" would answer the purpose, also the "Perfection," but the one I have seen in use lately is "The Excelsior." It would answer the purpose admirably.

In pumping liquid manure, either from a barrel or tank, there should be a vessel or compartment into which the liquid after having extracted what is essential from the manure, can filter and be free of that part of the manure that would clog up a pump. The refuse of the manure is not what is wanted by the plants and should not enter the pump. This is not difficult to arrange.

W. S.

LANDSCAPE GARDENING.

Subscriber says: "Can you tell me through the columns of The Review whether there is published in this country any practical work on landscape gardening, giving bedding designs, descriptions, etc."

The two following works should cover the whole subject: "Handbook of Practical Landscape Gardening," by F. R. Elliott, "illustrated, designed for city and suburban residences, designs for lots and grounds." Or "Landscape Gardening, or How to lay out a Garden," by Edward Kemp, "illustrated, a guide in choosing, forming or improving small places or large estates." Both these works are of moderate cost and can be obtained from book stors or the leading seedsmen. W. S.

BORDEAUX MIXTURE.

In your issue of February 24th I notice a request for making a barrel of Bordeaux mixture and a few directions for its use on chrysanthemums and celery. The answer signed by W. S. is not in conformity with the more recent methods of making this mixture, and as the value of the mixture depends very largely on how it is made it seems necessary to correct the matter.

"Briefly, the best results have been obtained from the use of the Bordeaux mixture made in accordance with the following directions: In a barrel or other suitable vessel place 25 gallons of water. Weigh out 6 pounds of copper sulphate, then tie the same in a

piece of coarse gunny sack and suspend it just beneath the surface of the water. By tying the bag to a stick laid across the top of the barrel no further attention will be required. In another vessel slack 4 pounds of lime, using care in order to obtain a smooth paste, free from grit and small lumps. To accomplish this it is best to place the lime in an ordinary water pail and add only a small quantity of water at first, say a quart or a quart and a half. When the lime begins to crack and crumble and the water to disappear add another quart or more, exercising care that the lime at no time gets too dry. Toward the last considerable water will be required, but if added carefully and slowly a perfectly smooth paste will be obtained, provided, of course, the lime is of good quality. When the lime is slacked add sufficient water to the paste to bring the whole up to 25 gallons. When the copper sulphate is entirely dissolved and the lime is cool, pour the lime milk and copper sulphate solution slowly together into a barrel holding 50 gallons. The milk of lime should be thoroughly stirred before pouring. The method described insures good mixing, but to complete this work the barrel of liquid should receive a final stirring, for at least three minutes, with a broad wooden paddle.

No. 2.

No. 3.

GLIMPSES OF THE STORE OF THE BERTERMANN FLORAL CO., INDIANAPOLIS, IND.

"It is now necessary to determine whether the mixture is perfect—that is, if it will be safe to apply it to the tender foliage. To accomplish this, two simple tests may be used: First insert the blade of a penknife in the mixture, allowing it to remain there for at least one minute. If metallic copper forms on the blade, or, in other words, if the polished surface of the steel assumes the color of copper plate, the mixture is unsafe and more lime must be added. If, on the other hand, the blade of the knife remains unchanged, it is safe to conclude that the mixture is as perfect as it can be made."

Complete directions for preparing Bordeaux mixture may be found in Farmers' Bulletin No. 38 on "Spraying for Fruit Diseases." In the same bulletin also directions may be found for applying the mixture. A hand syringe is very unsatisfactory, as it very soon clogs up, but a cheap spray pump, costing from $3.00 to $5.00 may be obtained of any hardware dealer. This pump with an occasional packing of the valve will last for years and may be used for many different kinds of spraying. Suggestions as to the pump will also be found in the bulletin mentioned.

ALBERT F. WOODS,
Acting Chief.

Division of Vegetable Physiology and Pathology, Washington, D. C.

GRAPES CRACKING.

This defect is evidently caused by an overflow of sap to the berries, which is generally enforced by too close pinching of the sub-laterals, accompanied with high temperatures and excessive atmospheric moisture, and much feeding at the root. And again if the house is shut up close, and the night temperature is allowed to run to 75 or 80 degrees, which it will do, at the season when this grape begins to take on color, the condensation on the berries in the morning is sufficient to crack the fruit, if the foliage is at all defective. And if the canes are old-established ones, too deep rooting may be the cause of the trouble. And

vines grown in a very retentive soil, if liberally treated, are almost sure to crack their fruits, unless very judiciously handled.

If W. M. will consider those items collectively, and maintain a fairly dry atmosphere, with a good circulation of air, and allow the sub-laterals to run unchecked from the time that coloring starts, the chances of cracking will be reduced to a minimum. Madresfield Court will take on a good color and finish up well under heavy shade.

VITUS.

CARNATIONS

NEW VARIETIES OF 1897.

Mayor Pingree.—Those who saw this variety as shown by Mr. Rudd at the exhibition in Chicago will agree with me in the assertion that Mayor Pingree as shown there is a grand flower. And Mr. Rudd has demonstrated that it can be grown, and grown with profit, too. With the prices he realizes in the Chicago market for such blooms, he can well afford to be satisfied with a few blooms less to a plant, then he can cut from many other varieties, and still be ahead. The general report regarding this variety is that it is a little shy. The most notable feature is the flower stem; its length and strength are remarkable; and when, as it appears, one stem represents the length and strength, crowned with a flower as large as two of Scott, we must not be so unfair as to expect the same number. Nature may assume changes, make deviations in one genus of plants, but we can hardly expect to double a plant's growing power at a point where the limit is nearly reached.

Our plants have furnished so far quite as good flowers as those shown at the Chicago exhibition, and under rather adverse circumstances as I have stated in my former notes on new varieties. Its habit is good, growth strong, flower stem par excellence, the flower large and of a pleasing form when fully developed. In the opening of the blooms we notice a peculiarity rather unpleasing, and this is the incurving habit of the petals, but give the flower time and the petals will straighten out, or nearly so, with only a slight upward curve. When arriving at the stage of going to sleep the petals curve and roll up again, making the opening of the blooms remind one too much of their closing, otherwise they are quite good keepers. One other defect I have noticed on our plants is that from 10 to 12 per cent of the flowers come with split calyces, although the calyx seems strong and well built.

This variety was sent out with considerable rust, but I believe with good care and selection of stock, it can be eliminated. Our plants do not show susceptibility to rust as do many other varieties, and appear now comparatively clean. We find bacteriosis as it is seen in most other varieties. We have not lost any plants with stem rot. Taken all in all this variety is a desirable acquisition, and will be grown for many years to come.

Harrison's White.—To give an illustration of the general opinion in regard to this variety, I will give the verdict of one of our customers as a sample of many like communications received, and which I fully indorse:

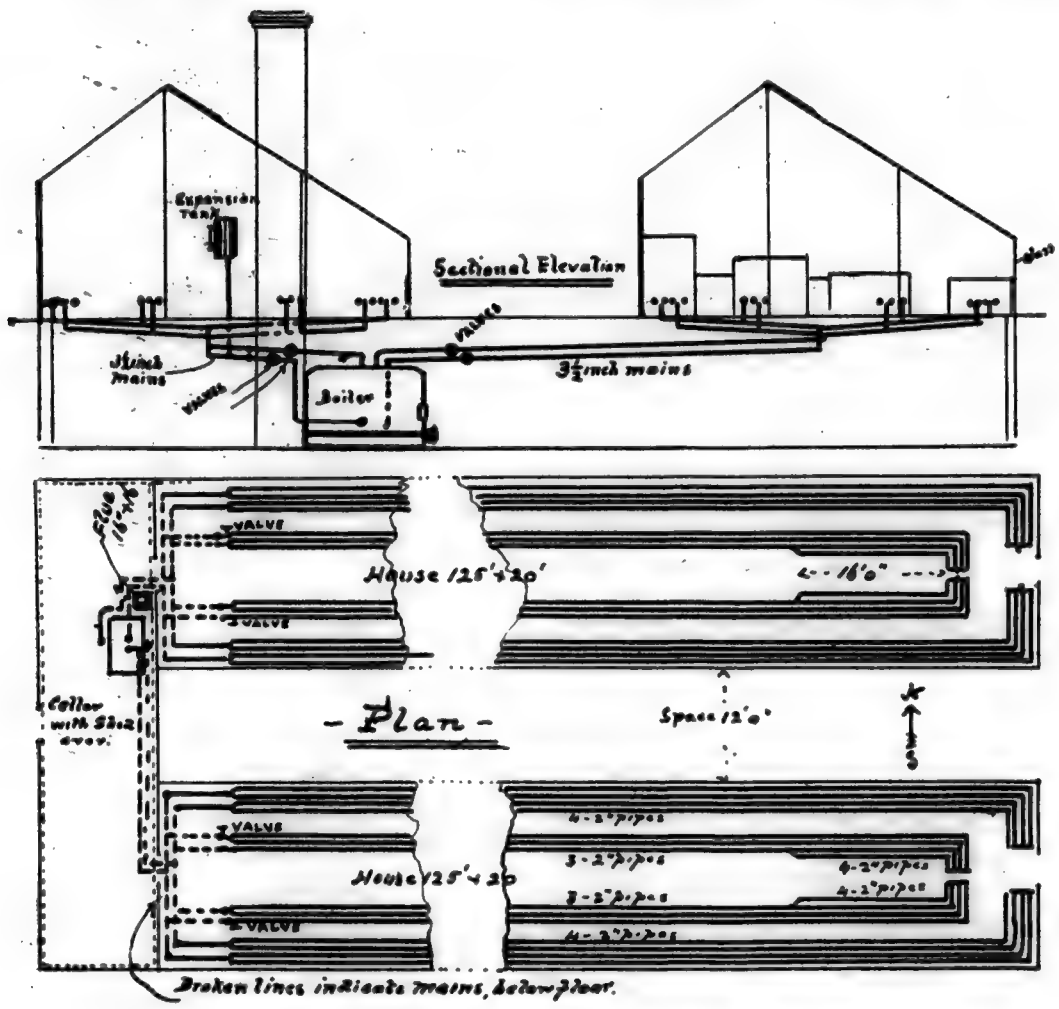
"Harrison's White in same house with Scott acts very differently. It is a very healthy, fine looking plant and produces very fine flowers on good stems of much better quality than Scott, but have had till lately very few blooms. It would take an acre devoted to it to give enough flowers for Christmas cutting (until some means is discovered so that it will mature earlier). With us it does not look like Scott any further than that it is a carnation, for while Scott is a sea of blooms and buds, Harrison's White is a compact mass of shoots waiting for Easter with a few flowers interspersed."

This is a very modest opinion, considering the general condemnation this variety receives, and it is needless to add anything more regarding its parentage, for everybody is convinced that it is not a sport from Scott. The general opinion is that it is Puritan renamed, but under the peculiar circumstances the disseminator detected this supposed sport justified him in believing it a sport from Scott.

It is far from my intention to admit any dishonest motives or to cast any reflection on the disseminator, but it teaches us a lesson regarding the instability of a too quickly formed opinion concerning a new variety. In this case the illustrious reputation of the supposed parent blinded the eyes of everybody, even those of experts, and the result is loss and disappointment. On the other hand, will not this cause us to reflect, and be less hasty in condemning a new variety before we have given it fair trial? Harrison's White had a fair trial, as the very large dissemination shows, and was found wanting. Had every new variety that has been condemned such a fair trial?

There were two more white varieties disseminated last year, which do not come up to expectations, and these are Nivea and Ontario. I do not doubt in the least that they have been satisfactory to the disseminators, and like many other varieties will be valuable in the locality where they originated. With us they are of poor growth, especially Nivea. The stems are weak, flowers rather pretty, but small, and I cannot suppress the opinion that their cultivation is a step backward.

Morello.—This was the only scarlet introduced the past season and is a good grower, but not so good a bloomer with us. Not giving it a satisfactory trial and not hearing much about it, I will give it another trial this coming season. So far, however, it has been inferior to Jubilee and Dazzle with us; but this will not exclude the possibility, that in other sections it may prove superior.



FRED DORNER.

VIOLET NOTES.

While the making up of designs and the growing of plants are two different things, yet the grower should know how to use what he raises, in the most artistic way, thereby, to a large extent, increasing the demand for the product of his houses. This applies especially to the violet grower, as violets lend themselves readily to rich, massive designs, even more than to light airy ones and still they are excellent for these if they are properly combined with the right greens. In bunching for street-wear, a long bunch made by using a leaf for every two or three violets and then commencing to wind with one of these for a point, adding on each side and top, making a long flat bunch with the foliage showing all through it, and finish by covering the last winds of thread with a violet ribbon to match (about number 2), and my word for it your lady customers will call for such a bunch the second time, for several reasons, the ease with which it is fastened to muff or corsage, and principally its improved appearance.

In making up funeral designs a combination of ivy leaves and violets is very rich and appropriate, especially for business men and elderly persons; columns, crescent wreaths, sickles, etc., being especially good designs for this combination.

In bunches to ship, the first impression of the consignee on opening the box is worth a good deal. In this matter much depends on the manner of bunching and the arrangement in packing. Previous to this season, the flat topped bunch with the leaves regularly arranged around the edges have been demanded despite the fact that they were clumsy, stiff and formal, but this season the demand has been for an artistic, properly arranged bunch, made by placing the lower ends of the stems even, allowing the flowers to be

Plan for Heating Two Three-quarter Span Houses.

at different heights, with the foliage in the same manner, through and around the bunch. This allows the individual flowers to show up for all that they are worth, as they cannot when leveled off, and improves the appearance in every way, even though it may not measure as much in diameter as the old flat bunch. As fast as bunched wrap a strip of tissue paper about the stems, and let the bunch stand in water till the stems are well filled, taking care not to get the flower wet at any time. After they are filled drain them for a few minutes to rid them of the surplus water, pack closely in layers, with the stems pointing in to the center, with oil waxed paper between each layer, but do not make more than three layers if possible. Always take care that they are packed tight, as they carry much better so. Of course due care must be exercised in wrapping the package, as they freeze readily. When the box is large enough, line heavily, as it is better inside than on the outside.

R. E. S.

VIOLET QUERIES.

"With a frame of Lady Campbell violets and a few California violets which have been grown outside for spring use, how shall I make ready to fill a small house in the fall? I would prefer not to use pots if I can have the same success without."

We would immediately take all the cuttings possible and place in the propagating bed, following this plan for several weeks yet, and then if in this way we did not secure enough stock the clumps could be lifted and divided for the balance, then follow previous notes in Review for treatment after this. Personally I would buy new stock rather than use the clumps, still many good growers do use them with success, and you might be able to do so.

"Can violets be grown successfully in a house with immovable g ass through the summer?"

This depends entirely on heavy shading, ample ventilation and an adequate water supply; that is, if the house has side and top ventilators and stands alone so that the heated air can freely pass out, and the water supply does not fail in the dry spells, I should try it.

"What are the characteristics of different varieties in time of blooming, keeping qualities, fragrance, dependence on most sun and ventilation?"

Good ventilation is an absolute necessity to all kinds. Lady Hume Campbell is the most fragrant of all, not keeping quite so long late in the season as Marie Louise, at least, not holding its color as well. This and Swanley white flower more freely the latter half of the winter than the first, and want several degrees more heat at all times than Marie Louise. The Farquhar and Marie Louise are the best violets to grow, if one can grow them, until March; after that your best violets will come from the Lady Hume Campbell, especially if kept closely picked.

"Which are the easier to grow, most fragrant, and best keepers, single or double?"

The single will grow the best with careless treatment. The best keepers and most fragrant are the double sorts.

"What varieties are preferred near Boston?"

Marie Louise.

"Our soil is light and gravelly. How shall I prepare a soil for greenhouse violets?"

Remove about six inches of the border, then spade as deep as possible, then cover with about four inches of well rotted sods; if these can be procured from a field where the soil is somewhat heavier, it is better. Spade this in well, then cover with about two inches of well rotted cow manure, dust this all over heavily with air slacked lime, say one quart to one hundred sq. ft. of surface, and spade again. If there is time, water heavily, and spade again as soon as dry enough not to hurt the soil, repeating this several times if possible.

R. E. S.

GREENHOUSE HEATING.

We propose to erect two greenhouses, each 20x125 feet, three-quarter span, 14 feet to ridge pole, running east and west, for growing cut flowers, roses, carnations, etc. Please tell us the best way to heat these houses.

Ohio. E. T. F.

The two three-quarter span greenhouses, having glass on the roof, vertical east end and two feet of glass on the south side, assuming a temperature of 60 degrees is desired, would be best heated by means of fourteen lines of two-inch wrought iron pipes, arranged as shown on accompanying plan, suitably connected to a boiler having a capacity of not less than 2,500 square feet of radiation. The mains should be of 3½-inch pipes, and should have a grade of not less than one inch in ten feet (better one inch in five feet) upwards from the boiler. The running pipes must have an upward grade from the boiler end of the house of not less than one inch in twenty feet, but it is well to give all the grade the height of benches and grade of land will allow, as increased grade means quicker circulation and more perfect and economical results.

At the east end of the center runs two additional pipes are laid for a distance of about sixteen feet, this is in order to take care of the additional glass exposure at this end, while at the west end, which is protected by the potting shed, the coils commence about eight feet away from the end, in order to avoid overheating this protected space.

An expansion tank should be connected to the return main, and placed as high as convenient in the potting shed, in all cases higher than the pipes at the far end of the houses, and air vents must be placed at the extreme end of all coils.

In case one of the houses is desired

of a lower temperature, say from 45 to 50 degrees, two lines of pipes in the center run may be omitted, but as the cost of running these additional pipes is so small and the advantage of being able at any time to increase the temperature is so great, it would be advisable to put in all the pipes as shown.

HENRY W. GIBBONS.

New York.

Pansies.

There is no time of year when you must keep a sharper lookout than now or many things will be spoilt. There is no frost in the ground and plants in cold frames, particularly pansies, want plenty of ventilation. We have had a spell of mild, bright weather, and they will begin to grow. The changeable weather has raised them out of the ground, so as soon as they are dry and the ground is mellow you should go over them, pulling out the weeds that have been certain to appear and pressing the pansies back into the bed. Give air to all stuff in frames on every favorable occasion.

Pelargoniums.

Pelargoniums that were propagated last September have been on a shelf near the glass in 4-inch pots since December last and with one pinching have made fine, sturdy plants. They do with little water during the dark days, but as the sun gets powerful, want to grow. A shift to a 5-inch pot will now be necessary, and if extra strong a 6-inch. Always remember that a pelargonium likes a solid potting, and as they will be too large for any hanging shelf, must have a light bench. At no time do they like any dampness, either on leaves, flowers or roots, or in the atmosphere, or I would say, not a damp house. While not wanting a high temperature at any time, they are easily ruined by a damp period in May, if the fire heat is absent; particularly is this the case when in flower, dampness causing the petals to drop on the foliage and decay of the foliage begins at once.

Seed Sowing.

The middle of the month is a busy time with seed sowing in our latitude. Asters, phlox, stocks, zinnias, marigolds and balsams if sown by the 15th are about early enough for the general crop and in right condition to sell to your customers for their garden. How to sow seed has been treated at some length of late, both from my pen and others. If you do err let it be on the side of sowing thinly. A bench where the temperature will average 55 degrees at night will do nicely for all of these useful annuals, and a shading of newspapers on sunny days will keep the soil from drying up. Plants with roots may like an almost natural time of dryness and then enjoy a good watering, but not so with seeds that are germinating. A uniform moisture will help very much to successful germination and welfare of the very young plant.

Cannas.

Cannas that were started a few weeks ago in flats and perhaps placed on the hot water pipes will now have grown six or seven inches high. If not convenient yet to pot them, move them into the light, and if not more than 50 degrees at night they will do well enough.

About the middle of this month we start our Caladium esculentum. We start them as we do cannas, placing them an inch or two apart in three inches of soil and give them the benefit of the heat of the pipes. They will quickly start by this method and you will save several weeks' time and valuable space on your benches. These roots have got down to a very low price, but don't let that induce you to buy the large size because they appear cheap. The 2-inch in diameter are large enough for any purpose.

Lilies.

For several years we have found a good use for the Lilium lancifolium, album, roseum and rubrum and a few L. auratum. The most useful of all is L. L. album. We have never tried to force them, and if they come into flower the earliest in July and a cutting is followed along till October, we find good use for them. We believe in potting them in 4-inch pots as received during the winter, placing under a cool bench and not watering. There is moisture enough in the soil to start them growing, and if they do not start for six weeks it is just as well. They have now made a growth of five or six inches, and when that far advanced must have the light of a bench and a shift into their flowering pots. A 5-inch will flower then nicely, but we find when three good plants are put into an 8-inch they take less watering, make better flowers and meet with a better sale. Great quantities of these lilies are cut from out of doors, but they are poor samples compared with those produced under glass, and the lancifolium type pay best, when they come in after longiflorum and candidum are gone.

Rhododendrons.

If you force any rhododendrons for Easter they are not nearly so easily started into flower as azaleas. If not showing an inclination to open their buds move them into a temperature of 60 degrees and keep them well syringed.

WM. SCOTT.

BALTIMORE.

The Market.

Trade continues at about the same pace as last week. The store windows are now resplendent in a glory of spring flowers.

Messrs. John Cook and E. A. Seidweitz both presented a very tasty display of miscellaneous bulbous stuff, which particularly caught the eye of your correspondent. Good stuff is now more plentiful and quite equal to the demand. The wholesale prices have changed but slightly.

Gardeners' Club.

In striking contrast to last meeting's "record breaker," there was but a slim attendance at the Gardeners' Club Monday, February 28. Little important business was transacted and upon the whole things were unusually quiet.

Messrs. Halliday Bros. exhibited a very fine specimen of Mrs. McBurney, the stem being almost equal in quality to that of a Beauty, and measured twenty-four inches long by one-fourth inch in diameter. Having looked forward to an interesting talk upon the never tiresome subject of carnations, we regret very much Mr. W. P. Craig's inability to be with us election night.

Question Box.

What are the advantages of planting chrysanthemums in benches over solid beds? Mr. Binder thought "no special benefit beyond the fact that better control could be had in watering."

Does huckstering plants affect the regular trade? The general sentiment of the club was voiced by Mr. Christy, who thought it did, as the class of people who did that kind of business were seldom reliable and in many cases both ignorantly and willfully misnamed and misrepresented, thus causing the public to become suspicious and to even distrust the legitimate trade.

Name the best geraniums for bedding purposes. Centaur, pink; S. A. Nutt, red; La Favorite, white.

To the question, "Would poinsettias ever come to the front again?" Mr. Pentland replied, "That their extremely difficult culture made it very improbable," a temperature of 80 degrees

being required in order to develop and hold the bracts. As there is yearly an increasing demand, the writer thinks it only a question of time before this so-called "flower" will be regarded as one of the Xmas requisites of every first-class florist establishment.

Mr. Aug. Rolker, of New York, and Mr. Paul Berkowitz, of Philadelphia, were in town a few days this week.

Obituary.

On Thursday, the 3d inst., Mr. Charles Hamilton died suddenly of apoplexy. Mr. Hamilton was in his seventieth year, and was born at Tyrone, County Armagh, Ireland, in 1828. After a preliminary education at private schools and the National academy, he commenced the study of floriculture in 1843, on the grounds of Sir James Strong, Lyon Abbey. At the expiration of four years he went to Dublin and for a time was engaged in the botanical gardens, when he afterwards entered the Revenue Excise in her majesty's service, which position he held until he came to America in 1851.

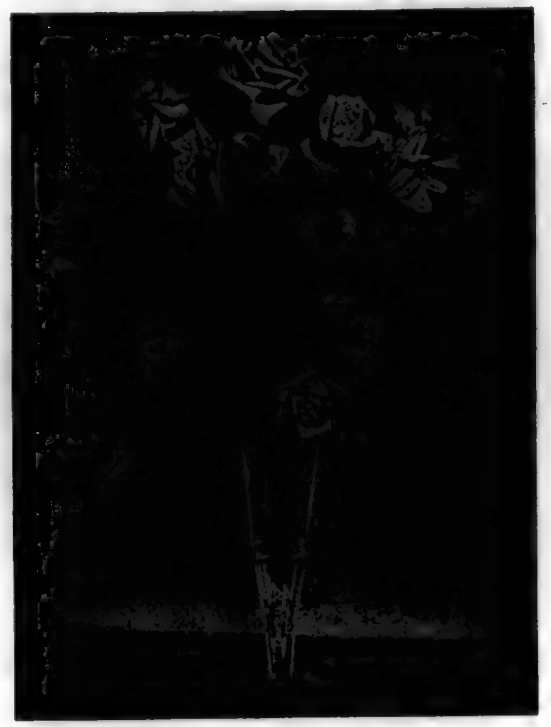
He was then engaged in the florist establishment of Solomon B. Davies. During this time he imported many orchids and rare exotics, which supplied the large conservatories of this city. In 1862 he established the florist business on the Old York Road, Waverly, which he managed until his death.

In him the Gardeners' Club loses one of its brightest and most active members, and his many friends in the craft extend their sincere sympathy to his bereaved wife and daughters.

C. F. F.

THE CLARA CEMETERY VASE.

The accompanying engraving is from a photograph of a vase for flowers in the cemetery, and it is certainly a vast improvement over the miscellaneous receptacles usually found in the cemetery. It is of heavy glass and stands about twelve inches high, the lower end being pointed so it can be imbedded about six inches in the ground and stand firm. The price has been placed at a figure which makes it possible to retail them at 50 to 75 cents and leave the dealer a profit of 100 per cent. It would seem that florists doing a cemetery trade should find a good demand for this vase. It is being introduced by Bassett & Washburn, Chicago.



NEW YORK.

Among the Wholesalers.

"It is only Lent!" for that reason, however, prices went tumbling down the toboggan slide in spite of a comparative scarceness in some lines. On Saturday there was a slight upward tendency, a fair day and light shipments contributing largely to this. Things are about the same as the early part of the week, a few shipping orders helping out considerably. Prices will rule, however, low in most lines, as low as any time this season.

The finest Beauties realize but half a dollar, while Brides and Bridesmaids reach top at $12.50, a few exceptional Bridesmaids selling for $15. Meteors hold pretty steady, but stock is slow and not taken hold of like the popular Maid. Testouts and Carnots are still very shy and only small lots are seen, and price in accordance. Morgans and Cusins take chances with the rest.

There was a slight overplus of fancy carnations that put the top price down to $5. Harrisii remain about the same, though the tendency will be liable to trend upward from now till Easter, a large order for 10,000 flowers for the end of the month using up considerable of the surplus. Valley, after rallying a little, dropped again into the old rut.

The Clara Cemetery Vase.

Bulb stuff has not been so heavy as a rule and some of the better class of tulips have realized fair prices.

Brunners are commencing to assert themselves, but 40 cents is the top price for the best. For average prices see New York market.

Mr. Thomas Young, Jr., is always busy and his store has an air of neatness and dispatch. He takes special pride in his window which is at all times bright with seasonable flowering plants, tulips and hyacinths being much in evidence these days, with a backing of smiling clerks.

Seed and Bulb Trade.

Mr. William J. Elliott has returned from his trip to Bermuda, where he inspected the Lilium Harrisii crops. The disease has worked sad havoc in some sections, while other sections are entirely free from it. The crop as a whole is likely to be much shorter than heretofore. Mr. Elliott was much impressed with the island and its characteristics, and returned feeling much benefited by the trip.

Mr. John Clark, representing Joseph Breck & Sons, of Boston, was a recent visitor. Jack is looking the picture of health and from indications business must be good.

William Elliott & Sons hold their first spring auction next Tuesday, March 15, and will sell a fine miscellaneous lot of goods.

The Park Board selected Mr. John de Wolf of Brooklyn, as landscape architect-in-chief at a salary of $4,000 a year from thirteen applicants. Mr. de Wolf will be consulted on all changes in the park system of Greater New York.

Our Special Wholesale Report.

Business has been dull throughout the week, with a liberal supply of stock. Things have been going on from bad to worse since last Monday. This inactivity is not at all unusual for the early weeks of Lent, but it is just as hard to get down to the lower level of prices, which is its natural result. The higher grades of stock have been most affected and have been difficult to dispose of at steady prices.

Special Brides and Bridesmaids could be had at prices much below last week's quotations. Long Beauties went down to 50 cents and the shorts found indifferent buyers at low figures. Brunner has now entered the field against the Beauties and sell on a par with them, having a preference with buyers at present, because of their superiority in form and color. Jacks, too, are now coming along, but do not find a ready market.

Carnations, up to Saturday, were plentiful and sales dragged at reduced prices compared with the previous week, fine Scotts and Daybreaks selling as low as $1.25 and $1.50 per hundred. There is no use for poor stock and many of the low grade carnations were not sold.

Valley has dropped in price and, with tulips, Harrisii and freezias, is in limited demand. Daffodils move slowly. The violet market is in bad shape. They are all sold, but at unquotable figures.

The Florists' Club.

The regular meeting of the New York Florists' Club will take place next Monday, March 14th, and Professor John B. Smith, of New Brunswick, N. J., will lecture on the subject of "Greenhouse Pests."

The club will also hold its monthly exhibitions for the medals and certificates, and intending exhibitors should "read, mark, learn and inwardly digest" the rules governing same and appearing in our issue of February 17. About a dozen more names are on the nominating list and the club is on the high road of prosperity and usefulness.

Market Florists' Association.

There will be a special meeting of the Market Florists' Association, next Tuesday evening at 7:30, in Leach's restaurant, for the allotment of market stands and the transaction of busi-

ness preparatory to opening March 26. Stands will cost $1.12 and $1.25 and all growers and those interested in the association's work are invited to attend. There is every indication of the project being a success and laying the foundation of what will ultimately be the plant market of New York City.

The initiation fee is but $1 and a deposit guarantee of $5 if you expect to take a stand. All information can be furnished by the secretary, Mr. A. D. Rose, Jersey City, or any of the officers or members of the association.

Various Notes.

Mr. Owen P. McDonald, manager for N. Christatos, suffered a severe loss in the death of his wife last week, and has the sympathy of all his friends.

Many favorable comments have been made on the enterprise of The Florists' Review upon their comprehensive report of the club dinner and the photographs which arrived here Saturday morning, less than one week after the event.

Mr. James Clark, the genial manager of the Seawanhaka greenhouses, Oyster Bay, L. I., and several Holland gentlemen, who are visiting this country for their health and incidentally business, were recent visitors.

Brooklyn.

The members of the Bedford Club, Brooklyn, held a jollification a few evenings ago, the event being the working of the good fellowship degree upon Mr. U. G. Scollay, and the presentation of a handsome diamond solitaire. U. G. S. is a very popular member of the club, and The Review offers him congratulations.

James Mallon's Sons were very busy making up bouquets and baskets for a commencement held at the Academy of Music. Some of them were very handsome and displayed excellent taste.

James Weir's Sons are having a big call for boxes and trays of tulips and hyacinths, which are dressed with crepe paper and ribbon. They report business fair considering it is Lent, and expect to have about 40,000 lily flowers for Easter, including a very fine lot of azaleas and hydrangeas.

J. V. Phillips has plenty of funeral work all the time, and his window was a regular bower, containing some very fine rhododendrons and azaleas, well flowered and good varieties.

Mr. William Scollay is on the sick list.

John Scott is working up a fine stock of Pandanus Veitchii, also young ferns and palms. His cattleyas have also done good service this winter and fully paid for their board.

CHICAGO.

The Market.

Business is decidedly better than at the same period last year and indications are favorable for good trade all through Lent. The shipping trade is holding up particularly. The supply has increased largely and there is some surplus of tea roses and colored carnations, and in this stock and most bulbous flowers only the best find a market. The call for funeral flowers has been very steady and this has been the backbone of the market. At no time so far have there been such gluts as at the same season in former years, though undoubtedly some stock has failed to find a market, and there is a tendency to make special rates on large quantities. Prices on tea roses range from $3 to $6.

Notes.

This Thursday evening is "Rose and Violet Night" at the Florist Club. The discussion on roses will be opened by Mr. Fred Hills.

Bassett & Washburn are cutting large crops of very fine Brides, Bridesmaids and Meteors. Their cut of Beauties is also very large. They note a call for a better grade of flowers than formerly.

E. E. Peiser, of Kennicott Bros. Co., is spending a few weeks at West Baden, Ind. Mr. Flint Kennicott was on the sick list the first part of the week, but is now about again.

John T. Glover, of Winter & Glover, is also on the sick list.

W. E. Lynch has taken the agency for the Bohn ice box, made especially for florists, and displays a sample in his salesroom. It has a glass front and is very neatly and substantially made though the price is moderate. Mr. Lynch has given the box a thorough test and finds it economical and effective.

Mr. M. Rice, of M. Rice & Co., Philadelphia, paid the Chicago trade a visit this week. Mr. Roscoe Saunders, Aurora, Ill., was also a visitor.

Oscar Kreitling is building a new store with greenhouse attached, at 1566 W. 12th st., which will be fitted up in first class style. He will still retain the old store at 380 W. 12th st.

Vaughan, McKellar & Winterson are further increasing their stock of florists' supplies and are rapidly developing their trade in this department. They are also doing quite a business in plants. A lot of good cinerarias from a local grower were meeting with quick sale. Mr. McKellar thinks there is a decided future for the trade in plants.

By the way—Charley McKellar has a new hat which is so loud that you can hear the band play.

And don't miss the opportunity of sizing up Ed. Winterson in his new 29-cent suit and 7-dollar hat. It's a great combination.

ST. LOUIS.

Condition of Trade.

The cut flower trade in this city has felt the effects of Lent but little, nearly all the downtown stores having had something to do, most of it being for funerals. In the west end the florists say that Lent did not seem to have any effect on them the past week.

Stock did not accumulate at the wholesale houses, except violets and bulbous stuff.

Prices.

Prices are a little lower than they were a week ago. The market was never better supplied as to quality and variety of stock than at present.

Roses in all the popular sorts are not abundant and bring from $4 to $8, the latter figure being for good, long stemmed stock, such as Brides, Bridesmaids, Meteors and Kaiserin. Perles and Woottons bring $3, the best going at $5. A few extra fine Beauties were seen last week which sold at sight. Carnations are a little more plentiful just now; still good common stock sells at $1.50, with fancies at from $3 to $4.

Bulbous stuff is very plentiful and the Dutch and Roman hyacinths are sold at $2 and $3; daffs, $3; tulips, good, at $2 and $4 for the best; valley, $4; Harrisii, $12.50; callas, $8 and $10.

Violets are a great glut and have been for the past two weeks. Home grown California are held at 25 and 35 cents per 100; small singles, 10 cents; doubles, 25 and 35 cents; southern stuff of all kinds is coming to this market in great quantities and is selling for almost nothing. All kinds of greens are selling well; Smilax not over plentiful, at $12.50; adiantum, $1.00, and asparagus, 35 and 50 cents per string.

Notes.

Visitors in town are Lloyd Vaughan, of Vaughan, McKellar & Winterson, Chicago, and Martin Reukauf, representing H. Bayersdorfer & Co., Philadelphia.

Edward C. Buechel, secretary of the Riessen Floral Co., has been appointed chairman on special prize committee in place of William C. Young who resigned.

The manager of this year's chrysanthemum show reports that up to date the special prizes subscribed amount to $1,200. A souvenir program with colored plates will be one of the features of this year's show which will be held at the Coliseum.

Bowling Items.

The Bowling Club on Monday began its March series of 12 games. The usual three games were rolled. Mr. Lloyd Vaughan of Chicago, rolled with the members. Our high man for the night was C. C. Sanders, with 558; single high score, 214. Beneke, second, with 533; high score 189. Fred Weber, third, with 521; high score, 179. Dr. Helwig rolled two high single scores of 207 and 209, and Carl Beyer made 209 in one game. The attendance was good. J. J. B.

PHILADELPHIA.

Trade Review.

Business has become quieter, yet the conditions are by no means unfavorable. The growers are beginning to throw out a table or a house of some rose or carnation to make room for young stock and this, together with

the fairly cold weather we have had—two snowstorms so far this month—and the fairly brisk demand, has kept prices from dropping much.

There is difficulty in disposing of some cheap stock, but the retailers are coming forward nobly. "To keep the street men from getting 'there,'" as one bright storekeeper put it, as he bought a hundred short stemmed Beauties and put them in his window, attaching to the vase a card with a tempting price written thereon. Several weddings occurred last week and more are to follow, so prospects are encouraging.

The novelty in the plant line is climbing Souvenir de Wootton. This rose is said to have originated some years ago with Thomas Butler at Wyndmoor, and is what its name indicates, a climbing form of the old Wootton. It is being forced by Robert Craig & Son, prettily trained and evenly flowered.

The Florist Club.

The Florist Club meeting on Tuesday night was well attended and very interesting. W. P. Craig read a paper on the Carnation Convention at Chicago, which was heartily applauded; he also showed some blooms of the new varieties. The club decided to have a shad dinner later in the spring. John Burton's knowledge of parliamentary law, gained in the state legislature, greatly helped his side in a particularly lively debate. W. N. Rudd, of Chicago, was present and addressed the meeting.

The Botanical Society held a special meeting on Friday at which Robert Craig and Wm. K. Harris were to make addresses on "Living Plants."

Notes.

The agents of the bulb growers in Holland are with us now. They do not find business brisk in this city, but believe it will be better after Easter. There is some complaint about Narcissus Von Sion. The demand for this double daffodil has increased enormously in the past ten years, until this year it has given general satisfaction, being easily forced and very lasting. This year some of the flowers remain green in the center when fully blown or fail to develop at all. It is said that the leaves die too soon in Holland, causing the bulbs to ripen prematurely. The source of the trouble is unknown. Buyers of Narcissus Von Sion will do well to instruct the bulb growers with whom they deal on no account to ship them any stock not properly ripened. It will not prove satisfactory. No reliable firm will wish to ship this stock when the facts are known to them.

Saturday saw the close of the tournament of the Philadelphia Trap Shooters' League. Eleven teams competed on the handicap plan, the Florist team finishing second; a most creditable showing, especially when it is noticed that the Wayne Club, who captured first, received forty odd targets more handicap. The team comprised Messrs. Anderson, Bell, Burton, Cartledge, Hallowell and Parks. Following the team shoot were some special events. No. 7, 10 targets, known angles, was won by John Burton from a large field, with a clean score. J. W. Y.

WASHINGTON.

Trade Resume.

It was said of the Christian Endeavor people when they convened here that they brought a shirt and a $5 bill with them, and carried both away. The same cannot be said of the Daughters of the American Revolution here in convention last week. The stores that depend almost entirely on transient trade report a good week—in fact, better than the week preceding Lent. In addition to this, the passing away of several prominent citizens assisted the usual demand for flowers, which made the first week in Lent a busy one. Social functions do not cease in Washington society during the Lenten season, the demand for loose flowers for social teas, etc., being satisfactory to the trade.

Prices remain firm, quality of stuff good and quantity equal to the demand, with the exception of carnations, Violets are getting more plentiful and remain firm in price.

I notice that the carnations in this vicinity are bursting their calyces, particularly Scott. Last year it would have been difficult to find a single case of the Scott so deformed; this season it is the case with all the growers.

The florist store formerly owned by Mr. Eugene Cadmus, and later by Mr. Ignatius Glorius, was sold at public auction on the 23d inst., of all its contents, fixtures, designs, etc.

Appreciated Resolutions.

At the last meeting of the Commercial Florists' Association, a vote of thanks was sent to the Cleveland Florists' Club for the set of strong resolutions adopted by them and sent to the members of congress from their state, denouncing the system of free distribution of plants and flowers by the United States government in the District of Columbia, and the thanks were of that good old-fashioned kind from deep down in our hearts. Let us hear from the others, for we need your assistance, without which we can make but little headway.

Col. Bingham, in charge of public buildings and grounds, evidently thinks he can extend his system of free distribution still farther. Not content with robbing the florists of the cream of their trade, he has now extended the system to include private marriages. Last week, at such a ceremony, the plants for decorating the house, bride's bouquet and cut flowers were furnished from the government greenhouses by his order. If this continues many more seasons there will be no business for the florists. Even the police detailed for duty at the executive mansion are beneficiaries. One recently asked for and received a funeral design.

While writing of government competition I would like to correct a statement I made some time ago, in which I said the agent who was sent out by the department of agriculture to purchase plants had stated the plants were to be given to members of congress and other officials upon the assembling of congress. The parties who gave me the information are not certain that he used the words or intimated the plants were to be used for that purpose, and I willingly correct it. I would not meaningly do an injustice to him or any one else. W. H. K.

ROCHESTER, N. Y.

Supply and Demand.

With the bright and only moderate cold weather we are having lately, flowers become more plentiful every day, bulbous stuff especially coming to market in very large quantities and not all of it can be worked up to advantage. Carnations and violets, however, are readily disposed of and none of the roses are spoiling. The demand all around continues very good, though some days a slight decline could be noticed.

Personals.

Geo. Arnold is supplying this market now with his well grown, long stemmed sweet peas, which are the admiration of all and sell at sight; the supply, however, is not yet up to the demand, but increasing rapidly.

John Dobbertin, who for a number of years has conducted a small but well paying business on the outskirts of the city, is now preparing to open a regular florist store in a more central location on Clinton street and is quite confident of success. Go ahead, the more the merrier.

Young Rhind, from Canandaigua, was in town last Saturday making the rounds among the growers. He is a very bright young man, the son of the well known successful violet grower Duncan Rhind and certainly takes an earnest interest in the growing of cut flowers of every description, though for the present his father has no intention of growing carnations or roses more largely than heretofore, but may do so later. Violets have proved to be with him a most satisfactory crop, and although the diseases have bothered his plants early in the season, they are now, as he says, remarkably clean and healthy and the flowers coming to town prove it, for they are among the best in this market.

The friends of Mrs. F. Schlegel will be pleased to know that she is slowly but surely recovering from her severe injuries and will soon be again able to go about as usual.

W. L. Keller, of J. B. Keller's Sons, is at present in New York on a visit to his uncle J. M. K., of Bay Ridge. Novelties in Easter stock he is after, but it is doubtful whether he will find what he is looking for.

George J. Keller all at once comes out now with the finest lot of Agathea coelestis we have seen yet. He kept his plants hidden away in a frame until last week and intends to get all of them in for Easter. They are nice little stocky plants in 5-inch pots, now full of buds and there will be no trouble to dispose of them, for they are really splendid. He also has the finest lot of late cyclamen; just right for Easter. They were kept back in a very cool house and are now profusely covered with buds.

Harbingers of Spring.

On the southern slopes in Highland park we noticed last week, that the little snowdrops are out almost in full bloom. In their protected situation they have been in flower usually very early, but this is to my knowledge the earliest date since the establishment of the parks. Quite a generous quantity has been planted additionally last fall and it can plainly be seen that the public appreciate the efforts of our untiring superintendent, for visitors are decidedly numerous in this park whenever the weather is pleasant, though the snow has not disappeared yet from the northern and eastern slopes nor in the deeper ravines of the grounds.

K.

BOSTON.

Club Meeting.

At the last meeting of the Florists' Club the members listened to a very interesting discourse by Mr. Emil Mische on the Royal Gardens at Kew, England, which brought out considerable discussion. A vote of thanks was tendered the lecturer.

Mass. Hort. Society.

At the weekly exhibition there were only a few displays. R. & J. Farquhar showed a fine new variety of narcissus; Peter B. Robb, of Whitinsville, a good variety of Cattleya Trianae; Mrs. E. M. Gill, of West Medford, a fine plant of Agathea coelestis, an old plant, but one worthy of more general cultivation.

At the monthly meeting there was quite a discussion as to whether the society should move or remodel. A project was mentioned of building a large glass structure on Boston Common by permission of the city government. Further action will be taken at the next meeting.

The Market.

There has been a heavy increase in the supply, which has also improved in quality. Ruling prices are about as follows: Beauties, $8 to $50; Brides, Maids, Meteors, $4 to $12; Perles and other varieties, $2 to $5; carnations, $1 to $2; Harrisii and longiflorum, $6 to $8; narcissus, Romans and valley, $1 to $2; violets, 25 to 60 cents per 100.

Various Notes.

Recent visitors were J. E. Killen, representing C. H. Joosten, New York, and several Holland bulb growers. The latter say that the crop of hyacinths was light, but that narcissus and other bulbs are plentiful.

Mr. Carl Blomberg will deliver a lecture on aquatics before the Florists' and Gardeners' Club of Newport March 23.

REPLY OF A BOSTON EDITOR.

One of the unpleasant things a park superintendent has to meet is the fierce criticism of the uninformed when the superintendent finds it wise to thin out existing plantations of trees and shrubs. And unfortunately these criticisms are often made the basis of a sensational article by one of the local dailies which still further misleads the public. We are pleased to note that the Boston Transcript has set a good example in such cases, as evidenced by the following inquiry and answer that appeared in its issue of Jan. 31 last:

To the Editor of the Transcript:

Will you please inform me who is this man Pettigrew who is ruining the beautiful park with his axe? And is there no asylum in Boston for idiots? G. E.

Mr. J. A. Pettigrew is the chief executive of the Board of Park Commissioners of the city of Boston and superintendent of Boston parks. He was superintendent for many years of Lincoln park in Chicago, which was practically made by him, and lost his place because he incurred the displeasure of Governor Altgeld. Immediately after leaving Lincoln park he became superintendent of parks in Milwaukee, Wis. At the end of a short time he was chosen to fill the more important place of superintendent of the parks of Brooklyn, and from Brooklyn he was brought a year ago to Boston. He is a conservative, cautious, economical man, with executive force and a practical knowledge of trees and their cultivation, road-building and the general necessities of park management. He is the acknowledged head of his profession in the United States, and since he has been in Boston he has been asked to return to the charge of Lincoln park in Chicago, to become superintendent of the parks of Buffalo, New York, and of the parks of the borough of Manhattan in Greater New York. During the year he has been in Boston he has saved his salary ten times over by systematizing park work and cutting off needless expenditures. As long as Mr. Pettigrew remains in his present position and is supported by his commissioners the people of this city need feel no anxiety about their parks.—Editor.

SUB-WATERING.

The essay by Prof. Arthur, read at the convention of the American Carnation Society and published in our last issue, has attracted much attention from progressive growers. One of the greatest drawbacks to the proposed new method is the expense of lining the greenhouse benches with zinc to secure a watertight bottom. Mr. Washburn, of Bassett & Washburn, Chicago, is contemplating the experiment of lining some benches with the stiff blue clay subsoil to be had in his vicinity at Hinsdale. His idea is to line the benches with the clay, then place in a layer of cinders and broken bricks, and over this a layer of Jadoo, upon which is to be laid the soil. The cinders and broken brick would have the merit of cheapness and the Jadoo would keep the soil from packing among the bricks, and at the same time act as a quick absorbent. He intends to experiment on the lines above described and the results will be looked for with interest.

CHEAP FUEL FOR GREENHOUSE HEATING.

From the number of letters I am now receiving from florists in all parts of the country, I think the above question might be of interest to the many readers of your valuable paper.

We are now well on in the second winter that I have used exclusively clay and hard coal screenings in about equal parts. Clay wet to about the consistency of tempered clay for making stock bricks, slack and clay well mixed and used as mixed. In starting fires a few shovels of coke or soft coal is thrown into the furnace, or, if neither of those are at hand, a few sticks of wood, old blocks or anything that will take fire. As soon as the above is well started a thin layer of the mixture is put on, it is then left for one or two hours when it is well started and giving off heat; the furnace is then filled with the mixture and there is nothing more to do for ten or twelve hours, when it is again filled up and left till ready to clean out forty-eight hours from time it is started. My boiler has two distinct furnaces, one of which is taking care of the boiler while the other is burning up, or one bright fire at all times.

I find several florists have been trying my mixture in an ordinary boiler with more or less success, less as a rule. Any one who would like to try it should start the fire in the usual way, say with hard coal, and get up a strong heat; before the coal begins to get dead fill up the furnace with the above described mixture, it will deaden the heat for some time; when it

gets well started they will be surprised at the amount of heat it gives off and the time it will last. Before it is burnt out clean the experimenter will find that the fire must be drawn as the heat is going down too fast, as nothing can then be done but draw out the fire and make a new start; in that case the stoker will want to give up his job rather than try the experiment again. If the fire can be allowed to burn out clean the drawing out is an easy matter if the furnace door is large enough. If the furnace is enclosed in iron or water spaces it cools off so fast when fire is dumped or drawn it will require a lot of coal to start the mixture; it would be almost like using up a cord of hickory wood to burn a cord of sweet chestnut.

Any cheap fuel that I have ever used I could never find satisfactory for greenhouse purposes with a single furnace to the boiler, as there is too much time lost before it gives out sufficient heat. I have used peat as fuel where we could cut and stack it within twenty yards of the furnace; it would give out a strong heat, but made so much ashes it was impossible to keep grates clear, and dumping fires so often to get rid of ashes, it proved a failure. If the same material was at hand it could be used successfully with the double furnace.

S. TAPLIN.

Detroit, Mich.

PITTSBURG.

Business Keeps up Well.

For the first week of Lent business has kept up well. Indications here point to a continued good trade for the balance of the penitential season. Roses, carnations and Harrisii are selling well. Tulips, hyacinths and daffodils have been plentiful and cheap. Blooming plants are rather conspicuous in our show windows, azaleas and genistas prevailing.

The Lily Disease.

Your correspondent, in an interview with Mr. Fred Burki, was informed that in his opinion the greater prevalence of disease in the Harrisii is due to the shipment of unmatured bulbs. It is supposed that shippers in Bermuda, in order to evade the tariff duties, sought to make their shipments as large as possible, and in this way, after the best bulbs had been selected for the earlier shipments, which proved, to a large extent, free from disease, the more immature bulbs were drawn on for later shipments. It is a fact that disease is more common in the later shipments. A number of growers here place their loss as high as 60 per cent of the product.

Always Mention the....
Florists' Review
When Writing Advertisers.

WANT ADVERTISEMENTS.

A FIRST-CLASS MAN is now open to engagement fully competent in every respect; expert grower of both plants and cut flowers; wants an opportunity to better himself; no object to change unless there is an opportunity for him to show his abilities on a scale that will make his services worth at least $75 a month. Address S. D., care Florists' Review, Chicago.

WANTED—A good florist, married man preferred; one who thoroughly understands the growing of carnations, roses, violets and mums; must be pleasant and honest, to such a steady job and good wages; references expected. Address Boston, Florists' Review.

FOR SALE—Cheap for cash. An old established florist and seed store in Chicago, doing good business. Reason for selling, owner has two places. Address M. O., care Florists' Review.

SITUATION WANTED—As foreman by an up to date rose and cut flower grower; good manager and hustler and can furnish best of references as to ability to fill a first-class position. Am open for an engagement at any time desired. Give full particulars when writing. Grower, care Florists' Review.

SITUATION WANTED—By young man, 19, on large private or small commercial place, where thorough knowledge of bedding and landscape can be learned; 3 years' inside commercial experience. A., 439 Bromhall Avenue, Jersey City, N. J.

SITUATION WANTED—As foreman or grower on commercial place, unquestionble ability in all braches. Reliable, industrious and capable of assuming entire charge. Nixon H. Gano, care of Florists' Review.

FOR SALE—600 feet of 4-inch cast iron pipe and fittings; 38 boxes of 10x12 double A glass; a 14-feet iron smoke stack. Address Paul Krohn, 175 N. Clark St., Chicago.

SITUATION WANTED- By practical all round florist, German, age 36, single; 20 years' experience in propagating and growing roses, carnations, mums, violets and pot plants; best of references. Florist, 713 W. 8 St., Cincinnati, O.

SITUATION WANTED—By florist, with life experience in growing cut flowers and plants, as working foreman; is holding a similar position at present; American Beauties a specialty; A 1 references. Near Chicago preferred; age 30 and married. Address W. S., care Florists' Review.

SITUATION WANTED.—By practical florist as foreman. First-class rose grower, also cars. mums violets and general stock. 15 years in this country; 5 years in one commercial place; 8 in another; 2 years in present position. State wages paid. Good references; married. Address, B. C. care Florists' Review.

TO RENT.—14,000 feet of glass, consisting of seven even span, north and south houses. Near Philadelphia, Pa. X care Florists' Review.

GRAND RAPIDS, MICH.

The Florist Club.

The Grand Rapids Florists' Club held a meeting at Alfred Hannah's, on East street, near Burton avenue, Tuesday afternoon, Feb. 15. After a trip through both plants, for there are two. about one-half mile intervening, one grown exclusively to carnations, with which Mr. Hannah is very successful, and the other used for roses, mixed plants and flowers with which to supply his store trade, the meeting was called to order by Henry Smith, in the absence of President Stover. Charles Chadwick was admitted to membership.

Solid Beds vs. Benches.

Henry Smith read an able paper on "Roses." A great diversity of opinion was expressed regarding the advantages of growing on solid beds versus benches. Solid beds planted to Brides and Maids, with under drainage of tiles, was cited as showing that good roses can be grown in that way.

Walter Grey, of Cincinnati, was mentioned as being successful with solid beds, keeping the plants in bearing year after year, instead of replanting at great expense each year. Mr. Grey once remarked to the writer that he had wasted $2,000 per year in unnecessary expense of labor and new stock by adhering to the old method. He claimed finer flowers and a more abundant crop. Why don't the concerns around Chicago grow them in solid beds, was asked? The reply was that the soil was too heavy and wet, lacking proper drainage. Some considered it advisable to keep part of the plants in two years, similar to the method pursued by some Detroit florists, thus having one-half the stock one year old, the other two years old. The majority were, however, in favor of the present bench system.

Black Spot.

The cause of black spot was assigned to several conditions—overwatering, sudden changes of temperature, draughts and mulching too early, while the wood was in such a soft, sappy condition, and in such rapid growth that the plants could not assimilate it when the cold nights arrived. This condition, followed by hot days, causes a check in the flow of sap, resulting in a congested condition, followed by black spot. Bride, Bridesmaid, Perle and Meteor were considered the only profitable varieties to grow for winter blooming, and Kaiserin, Testout and La France for summer. While all florists must grow some American Beauty roses, it is not considered a profitable variety in this vicinity.

CAMDEN, N. J.—Mr. C. W. Turnley mourns the death of his little grandson, Lawrence Turnley, who died Jan. 13, aged 8 years, of diphtheria.

Always mention the Florists' Review when writing advertisers.

Greenhouse Woodwork

Open-air-dried Cypress Lumber is more durable, and better suited to Greenhouse conditions than kiln-dried stock. But you cannot get it from those that are engaged in the business in a small way—even though their entire business is confined to greenhouse material—for it takes a long time for the lumber to thoroughly dry and this means an investment in lumber that only those of large capital can make. The only way to have air-dried lumber is to buy green lumber and hold it until it dries. Those that order dry lumber from the producers of Cypress get kiln-dried stock. It is cheaper for them to kiln-dry than to hold the stock long enough to season it in the open air. We carry a large stock and fill all orders with open-air-dried Cypress clear of knots, sap and all other defects.

DWARF PAPAYAS.

MOST magnificent Bedding and Decorative Plant over introduced; equal to a Palm in beauty; grows with the rapidity of the **Ricinus;** not affected by drouth. Plants from 4-inch pots, set out 1st June, attained a height of ten feet, and though not watered once, remained fresh and vigorous during the extreme drouth. Send for half-tone illustration showing bed of these plants. Every Florist should have it. Price to the trade $2.25 per doz. for 3-inch pots; all propagated from a tree which has produced this Fall and Winter 192 pounds of its delicious fruit, the largest weighing 12½ pounds.

TARO PLANT.—The genuine Sandwich Islands Taro, entirely distinct from the common Caladium, and a much grander plant in all respects. $1.00 each. Ready May 1st. **Send for Catalogue.**

CINCINNATI.

Encouraging Outlook for Easter.

Springlike weather prevails and consequently stock of all kind is coming in quite freely. There is not an oversupply in the market by any means as trade continues to be quite brisk. Several big jobs are booked for the near future which will clean up any surplus that may accumulate. Roses and carnations are still in the lead. Violets are plentiful and are now selling fairly well, although the price on this once popular flower is not what it used to be. Orders and inquiries are coming in for Easter, and our growers say that they are going to hit it just right. Well, we only hope they will, and trust that they will be able to supply the demand without giving us any pickled stock.

Notes.

A. Sunderbruch's Sons had a large wedding decoration last week. It was the biggest affair of the kind for some time and gave them a chance to spread themselves and display their choice collection of palms to advantage.

Recent callers were M. Reukauf, representing Bayersdorfer & Co., Philadelphia; S. S. Skidelsky, representing R. Craig & Son, Philadelphia; D. McRory, with W. A. Manda, South Orange, N. J.

Mr. George Sawyer, foreman for Critchell's Sons, is visiting his parents at Summit, N. J. It is whispered around that there is another attraction in the east for George, and that upon his return he will be accompanied by a bride. He has our best wishes.

D. R. Herrick, of Price Hill, who has been quite ill, is now able to get around. B.

SHADING.

For some years we have used the following and find it the most satisfactory of anything we have ever tried:

For a shade that is wanted to last well on the glass mix one gallon of buttermilk, one gallon of water and a two-inch pot full of clay and apply to the glass with a whitewash brush. It will hold to the glass all summer if desired. The above proportions are for a light shade. If a heavier shade is wanted add a larger proportion of clay. A three-inch pot full of clay to the given quantities of buttermilk and water will make a fairly heavy shade, and a four-inch pot full will make as heavy a shade as will ever be needed. If the shade is not desired to remain long on the glass use less buttermilk. For a very light shade buttermilk and water alone answer admirably.

One excellent feature about this shading is that it can be easily and quickly removed when desired. All that is necessary is to wet it and it can then be quickly rubbed off with the brush, though it is not washed off by rains. C. K.

Effect of Weather on Business.

This fine weather we have been getting for the last week has been doing a lot of good and flowers have been better both in quality and quantity. In spite of it being Lent, too, the demand has been very fair and a good business is being done in the city at any rate. Some one writing in a contemporary over the signature E., says that the retail trade is too slow here in Canada. Well, perhaps, we may be a little slow in some things, but all the same, I don't think we lose much by it; "the longest way round is often the shortest way home." I wish to say, however, that the above mentioned E. is not the undersigned E.

Hort. Society.

The Horticultural Society meeting last Tuesday evening was a very pleasant affair and in spite of the election, very well attended, the ladies turning out in fine style. Mr. Utley, owing to sickness and press of business, was unable to continue his essay on Seasonable Seed Sowing, but Mr. Thomas Manton gave cultural directions for various house plants which were on the table and answered many questions, and the president, Mr. Ross, read a very interesting paper on House Climbers—Hardy, Half Hardy and Tender, which was well criticised and discussed. Mr. Ross makes an ideal chairman. His tact and geniality carry every one with him and make life seem worth living.

Executive Committee Meets.

The Executive Committee of the Gardeners' and Florists' Association went over the Chrysanthemum show prize list the other day and suggested a considerable number of changes which will have to go through regular meeting before being finally decided on. This meeting was a very lively one and there were any amount of motions and amendments and informal talk. E.

CONCORD, MASS. — Mr. Wilfred Wheeler has recently built two houses and is growing violets and carnations.

POLO, ILL.—M. E. Miller is building two houses, each 18x76, for carnations and general stock.

FREEPORT, ILL.—Louis Bauscher has added to and improved his greenhouses in many ways. His stock is in good condition.

ROCKFORD, ILL. — Among the many interesting things at the greenhouses of H. W. Buckbee is a fine house of Jubilee carnations. He has several houses of other varieties, but Jubilee is a favorite. The large stock of plants for the catalogue trade are in fine conditions. The establishment now contains 26 good-sized houses.

HUNT'S REVIEW OF THE CHICAGO MARKET.

Market during past week has been fairly active, on the whole, and everyone seems encouraged. The worst features of the Lenten decline have probably passed, and from now on more stock should move.

Prices have ruled low on everything excepting Brides, carnations (especially white), and smilax. Good smilax is now quite scarce, cause attributable probably to two things—growers having cut earlier to make room for bedding stock, and those not needing the room who are holding for Easter.

There was no especial marked event or flurry, and nothing is looked for to particularly interrupt the even tenor during coming week. The great demand has been for white stuff.

Violets are fairly plentiful and sell readily. Stocks are good in everything. Callas and Harrisii plentiful. Beauties drag somewhat, shorts and mediums having the call. Where, oh where! is the Carnot?

Nice lilac is to be had almost daily, while forget-me-not, pansies, and mignonette of exceptional excellence are quite plentiful.

From inquiries received, indications are that the trade generally is anticipating a large Easter trade. Many (may their tribe increase) are placing orders now. Our prophecy is for Easter: Low prices (for the season) and plenty of good stock.

DIXON, ILL.—Davis & Baird have dissolved partnership. The business will be continued by O. L. Baird.

ST. PAUL, MINN.

Business Conditions.

The Lenten season is upon us, but makes no appreciable difference in the amount of trade. Flowers are more plentiful and of better quality than at any time since the holidays and everything sells well. Wholesale prices have dropped off fully 25 per cent in nearly all lines, but retail rates remain unchanged. The only surplus noted is in violets. Carnations have been and are scarce—the demand being unusually large with a limited supply.

Outlook for Easter.

There is a fair supply of Easter stock in sight, though lilies will not be as plentiful as in former years. Fewer bulbs were planted and the ravages of disease will reduce the number quite materially, so that good stock will be scarce here and prices likely to rule higher than for several years.

We noted a recent lot of Japanese longiflorum at L. L. May & Co.'s in prime condition and just far enough along to be in excellent shape for Easter. If we could only have a late Easter each year we might bid adieu to the diseased Bermuda bulbs and rely entirely on the Japs for our supply.

Notes.

Henry Puvogel is bringing in some of the best violets of the season.

H. H. Schulte's place, on Grand Ave., is closed during the winter.

E. M. Parmelee, of the Allan Seed Co., Picton, Ont., was a recent caller. J. C. Vaughan, of Chicago, and S. Haynes, of Minneapolis, were also recent callers.

L. L. May & Co. report largely increased sales over previous years in their catalogue trade. X. Y. Z.

A JADOO CONSERVATORY.

We have received from the American Jadoo Co., Philadelphia, a handsome colored print of a photograph of a conservatory in which every plant had been grown in Jadoo Fibre and watered with Jadoo Liquid. It is certainly a very effective picture, and the luxuriance of growth and bloom speaks well for the potting material and fertilizer used. A copy of the picture may be had free on application to the American Jadoo Co., 817 Fairmount avenue, Philadelphia, Pa.

Use Economy and Make Your Own Pots

THE COW MANURE POT is the best in the world for young plants. For bedding and sending of plants it is the best thing ever invented. The cow manure forces the plant and makes it healthier. You do not need to disturb the roots in getting them out as you do in the clay pots. It is especially recommended for the sending of plants, as the plant does not have to be taken out of pot. For bedding all you have to do is to squeeze the bottom of pot and set out in bed. It never stays the plant, it holds the moisture better, especially if you have a dry summer. The pots stand watering in greenhouse and hotbed. Every gardener needs one of these machines. **Single machine, 2-in. pots, $4.50. Double machine, 2 and 3-in. pots, $5.** Machine weighs about 5 pounds.

HAROLD ELTZHOLTZ, CENTRAL VALLEY, ORANGE CO., N. Y.

SIMMONS'

New Light Colored **CARNATION**

Mrs. S. A. Northway

We introduce this variety with even more confidence than we did Portia, Silver Spray, Tidal Wave, Daybreak, Rose Queen, or J. J. Harrison, knowing that it will become as great a cut flower variety as any of the above. Plant of strong, free growing habit, entirely free from disease or rust; large round high built flower with perfect calyx and extra strong and long stem. Color a beautiful soft shell pink becoming almost white when fully open.

Orders booked now and filled in rotation. We shall commence to ship soon after Jan'y 1st. Price, $10.00 per 100; $75.00 per 1000.

Geraniums. Md. Bruant, Md. Jaulen, Fleure Poitevine, J. Ricaud, and J. Sallier, 2¼-in. pot plants, $5.00 per 100. Rooted cuttings, $3.00 per 100; $25.00 per 1000. Our superb stock of all the finest sorts, 2¼-in. pot plants, named, $25.00; unnamed, $20.00 per 1000. Rooted cuttings, $12.50 per 1000.

Fuchsias. A grand lot of summered-over stock in small pots that will make early bloomers, $3.00 per 100.

All Rooted Cuttings Cash with Order.
Our Price List describes many other fine plants. Send for it.

W. P. SIMMONS & CO., - Geneva, Ohio.

Two Great Sports.

Carnation Victor.

Undoubtedly the best Pink Carnation in commerce and certainly the most prolific bloomer, perfectly healthy and of vigorous growth.

Rooted cuttings now ready, $4.00 per 100; $35.00 per 1000. Come and see this Carnation growing.

Chrysanthemum Pennsylvania.

The finest yellow for cut blooms or exhibition purposes ever produced. Plants ready March 15, $5.00 per doz.; $35.00 per 100; $250.00 per 1000.

HUGH GRAHAM,
104 South 13th Street, Philadelphia.

FIREFLY!

A Rust-Proof Carnation for Business.

Bright scarlet and Positively RUST PROOF and as productive as Scott. Rooted cuttings, Feb. 15th, $10 per 100, $75 per 1000. Send for descriptive list of Firefly and fifteen other novelties of 1898, as well as fifteen varieties of '97; also older standard varieties.

Geo. Hancock & Son, Grand Haven, Mich.

KNOXVILLE, TENN.

"The rush of business prevented my attending the carnation convention, but thanks to the splendid illustrations of the exhibits there contained in The Review, I feel well compensated for the loss." This, with other eulogistic remarks, were uttered by C. W. Crouch as he piloted me through his carnation houses, where I noted Flora Hill and Scott doing finely. Roses are well grown, especially Beauty, which pays so well that additional houses will be built for their culture. The California violet is the leader, but Princess of Wales promises to be far superior to it. The season has been a good one all around.

C. L. Baum echoed this opinion, and is very sanguine for spring outlook.

W. M.

PLANT FOOD TABLETS.

We have received from Mr. A. H. Ward, Boston, Mass., a package of "Ward's Plant Food Tablets." The tablets are about half an inch in diameter, and are intended for the fertilizing of house plants, the tablet to be buried just under the surface of the soil. The tablet form is certainly a very convenient one and should meet the approval of those who grow house plants.

HOW TO GROW RUBBERS.

In the Boston Globe of Feb. 10 E. B. C. tells us how to do it. Where did he get this remarkable inspiration? He says: "Rubber plants require to be nourished, and if a teaspoon of castor oil is occasionally poured in a little trench made around the stalk and covered with the earth, it will be found very beneficial to the plant."

Lettuce AND OTHER **Vegetable Plants**

Lettuce—Big Boston, Boston Market, Tennis Ball, Grand Rapids and Reichner's Forcing. 15c. per 100; $1 per 1000.

The New Carnation, Cerise Queen

READ WHAT THOSE THAT ARE GROWING IT HAVE TO SAY:

Mount Greenwood, Ill.
MR. FRED BREITMEYER,
Mt. Clemens, Mich.,
Dear Sir:—In reply to yours for our experience of Cerise Queen, will say that under our treatment the color, form and substance is all that can be desired; we have also found it a very free and continuous bloomer and have never found a bursted calyx the whole season; it is a little weak in the stem, but we lay that to the poor place in which it is growing, also we think one should be careful and not overfeed it, as it does not need it, but produces a fine flower under ordinary care.
Yours truly, C. W. JOHNSON.

H. DALE, Cut Flower Grower,
Brampton, Ontario.
MESSRS. J. BREITMEYER & SONS,
Mt. Clemens, Mich.,
Gents:—The plants of Cerise Queen which you sent me last spring for trial have done well; the flower is of very pleasing color, stem medium length, 15 to 18 inches; habit of plant good. I shall plant it again next year.
Yours truly, H. DALE.

DAILLEDOUZE BROS.,
Flatbush, Brooklyn, N. Y.
JOHN BREITMEYER & SONS,
Mt. Clemens, Mich.,
Gents:—We have a few plants of your No. 16, Cerise Queen, on trial; the flower is medium size, but fine color, in fact the only fault we find is its dwarf habit; we should like to grow some for side benches, as we believe it far superior to Tidal Wave for that purpose, and should make a commercial variety, but not high priced. Please give us your best price on 1000 rooted cuttings.
Very truly yours,
DAILLEDOUZE BROS.

GEO. A. RACKHAM, Wholesale Grower,
Detroit, Mich.
J. BREITMEYER & SONS,
Mt. Clemens, Mich.,
Dear Sirs:—In reply to yours asking as to my success with your No. 16, Cerise Queen, will say that I consider it the ideal Carnation of its type, very productive, continuous, stiff stem, of medium length, and holds its color longer on the plant than any Tidal Wave ever grown. I shall plant a house of it, if I am able to procure the stock.
Yours, GEO. A. RACKHAM.

Copy of a Letter--- My order for 1000 cuttings, which is a big one for my small place, speaks louder than words. W. N. RUDD.

We predict **CERISE QUEEN** is the coming Dark Pink Commercial Carnation.
Orders booked and filled in rotation. Price. $2 per doz.: $10 per 100; $75 per 100 .
MAYOR PINGREE—The best of all yellows. Buy your stock from the Originators.
Our stock is in excellent condition; $5 per 100; $40 per 1000, R. C.

J. J. LAMPERT, Xenia, Ohio.

AMERICAN GROWN TULIPS.

Mr. Jas. Jensen, Supt. of Humboldt Park, Chicago, has presented us with a Belle Alliance tulip in a 4-inch pot, bearing four flowers. The bulb was from a lot grown in the State of Washington and given him to try. The results of the trial have been very satisfactory, the bulbs producing fully as freely as the Holland grown article, though they do not present so handsome an appearance when received, the skin being rough, probably due to being grown in a heavier soil than that of the Holland bulb fields.

NEW CARNATIONS.

Mr. P. H. Therkildson, Ironton, O., sends us blooms of two new carnations that seem very promising. One, named Anna Therkildson, is a pleasing shade of red, very full, three inches across, and borne on a good stem. The other, named Frances Willard, is a trifle larger than the preceding, equally full, very prettily striped with carmine on a white ground. The stem of this variety is also good. Should the habit and productiveness be satisfactory both sorts should prove useful.

FINE VALLEY.

We have received from J. M. McCullough's Sons, Cincinnati, O., two bunches of very fine lily of the valley, which, we are advised, is of the quality cut daily by Mr. Theodore Harcourt, gardener for Mr. Albert McCullough. The valley sent was certainly excellent and would rank with the best produced anywhere in this country.

RATS.

We find chloride of lime in open rat holes a decided quietus. Moisten a little when taken from a new can. The nimble nuisances object to walking through it. J. E. B.

A LETTER FROM WM. SCOTT REGARDING

GENESEE CARNATION

BUFFALO, February 8, 1898.

DAN'L B. LONG,

DEAR SIR:--You ask for my present impression of carnation Genesee, of which I am growing a bench of 1,200 plants.

Its habit of growth under glass is perfect and needing little support.

In size, purity of color, form and good stem, it leaves little to be desired. A random selected bunch of 25 flowers, picked on the 5th inst. for my retail trade, just as they grew, without any sorting, showed stems averaging 16 inches long, and blooms averaging 2¼ inches diameter. A very valuable feature is that in a hundred flowers there is scarcely one to discard as not up to standard.

Both last year and the present winter, it far outsells any white we have yet handled.

The most sincere result of my impressions is that next winter I shall grow it exclusively, for in my opinion its many and assured good qualities make it a commercial white superior to any that I have yet tried.

I am convinced that this fine white could be lifted with buds well advanced, thus ensuring flowers early in October.

My soil is a dark, sandy loam. One quart of bone flower to one barrow load of soil was used, but no animal manure. Yours very truly, WM. SCOTT.

12-Page Circular Free. DAN'L B. LONG, Sales Agent, Buffalo.

INDIANAPOLIS.

The Florist Club.

The regular monthly meeting of the Florists' Club was held Tuesday evening, March 1st. The attendance was very good in spite of the bad spell of showery weather prevailing.

The state committee on promotion for this year's chrysanthemum show reported that there would now be no question but that another show would be held. The Commercial Club will appoint a large committee to work with the florists' committee to make this year's exhibition a grand success in every way.

An excellent paper written by Mr. Haugh, of Stuart & Haugh, Anderson, Ind., was read by Mr. Parker, entitled "Observations." Many excellent points were given for every florist to follow, but to live up to all of them would certainly be a hardship to the average worker in soil.

The usual refreshments were served after the meeting, all greatly enjoying themselves.

Notes.

St. Valentine Day was unusually good for the florists and business on this day seems to be increasing from year to year.

Several florists got into difficulties with the Natural Gas Co. for turning on their gas after it had been shut off by the company on account of the severe weather and shortage to private consumers. Very likely it will be shut off for good to these people.

Herman Junge and John Bertermann have been on the sick list, but are now convalescent.

Since Lent business has dropped off considerably and flowers are getting more plentiful.

Mr. Heller, of New Castle, and Mr. E. G. Hill, of Richmond, were in the city a few days ago on business in connection with this year's chrysanthemum show. Another final meeting will be held shortly to arrange details for a grand exhibition. W. B.

LOUISVILLE, KY.

At the regular monthly meeting of the Kentucky Society of Florists, held in the new meeting place in the new Liederkranz Hall, the final arrangements were made for the spring show. This will be held March 29 and 30 and April 1 and 2. Those having new plants or blooms of new carnations to display are requested to send them to this exhibition. Special certificates will be given. For full information address Mr. C. H. Kunzman, 3710 High street, Louisville, Ky. KY.

Get my Prices on Everything Needful for Erecting or Repairing of Greenhouses.

U SHOULD write me your wants for everything entering into the building, heating or ventilating of greenhouses, as well as Unions for pipes and Universal Joints for ventilating apparatus.

V ENTILATION—I would call special attention to my patent arm.

It is so constructed that it cannot slip when once tightened up by the bolts, and, instead of the old fashioned solid eye, which depends on a single set screw and is continually slipping, we use an open eye fastened by two bolts. There are three grips in the eye, running parallel with the shaft, which, when screwed down by the bolts, binds on the shaft like a pair of pipe tongs and cannot possibly slip, for the more strain put upon it the tighter it will bind.

By using the open eye a broken arm can be very easily replaced, whereas with the solid eye the shaft must be taken down to slip the new arm in place.

Valves also, from the smallest for water pipe to the largest four-inch for heating purposes.

W EATHERED can and will cheerfully help you out of any difficulties you may have in the construction or heating of your houses. Wood I use is of red gulf cypress, free from sap. If you are in want of pipe for water or any other purpose, get my figures.

X CEL I try to in everything, especially in heating, building and ventilating apparatus, but don't forget I can supply you everything except masonry material.

Y S of wrought iron or heavy cast iron for every purpose. Write me your wants and they will receive careful and prompt attention.

Z—I don't keep on stock, but if you want it very badly I will try and get it for you.

AZALEAS FOR EASTER

We are carrying in stock an immense quantity of Azaleas for Easter forcing; the plants are in good condition and finely set with buds; the varieties we offer are only the best commercial sorts. As these plants can be more safely shipped when in bud, we wish to impress the importance of early orders. We will not be responsible for injuries arising from late shipments when the buds are developed.

AN UNPARALLELED SUBSCRIPTION OFFER.

EVERY one to whom this issue of the FLORISTS' REVIEW is addressed, and who fills out, signs and returns the accompanying subscription blank, accompanied by $1.00, within 30 days from date, will receive not only the FLORISTS' REVIEW for one year but also a certificate entitling him to the earnings on one-tenth of a share of stock in the company formed to publish the paper. The shares will be of a par value of $10.00 each.

Why do we make such an unparalleled offer? It is very simple.

You will have an interest in the success of the paper.

You will see that you can buy everything that you want to just as good advantage from advertisers in the FLORISTS' REVIEW as elsewhere and at the same time benefit yourself by increasing the earning power of your certificate.

This mutual arrangement cannot fail to bring to the paper a heavy advertising patronage, and as a result the stock represented by your certificate will earn good dividends.

And the more you buy of advertisers in the FLORISTS' REVIEW (always mentioning the paper) the larger your dividends will be.

You will get a better paper than has yet been published in this field, and a share of its earnings. Please let us hear from you by early mail.

PEPEROMIAS.

This is a very large genus containing hundreds of species. Those best known and most useful to the florist

Peperomia Saundersii (P. arifolia argyreia).

are P. maculosa, P. marmorata, P. pubifolia and P. Saundersii (often known as P. arifolia argyreia). They are from tropical South America, which stamps them as plants that like heat, but they endure a greenhouse temperature for weeks without any apparent harm. A pan of these beautiful little plants is very attractive and their fleshy, succulent leaves enable them to withstand the dry air of a living room better than the vast majority of our plants.

They need shade in the summer but none in the winter and should never be kept too wet. A lumpy loose soil with a mixture of broken charcoal, or even broken crocks, will suit them well, and a pan three or four inches deep is better for them than a deep pot. The best specimen of P. maculosa I ever saw was growing on a rockwork at the side of the path in a palm house where it received plenty of moisture but no superfluous water at the roots.

They are easily propagated in sand or sandy soil in a bottom heat of 75 degrees, either by the leaf, as you do Begonia Rex, or with an inch or so of the stem attached. Early spring is the best time to propagate.

The flowers of all are inconspicuous; it is the ornamental leaves that make the plant valuable. P. pubifolia is well adapted for a hanging basket. P. maculosa makes a fine subject for a pan, and the beautiful species illustrated herewith makes a compact plant of great beauty. All the species that are desirable for the commercial florist can be said to be of easy culture.

WM. SCOTT.

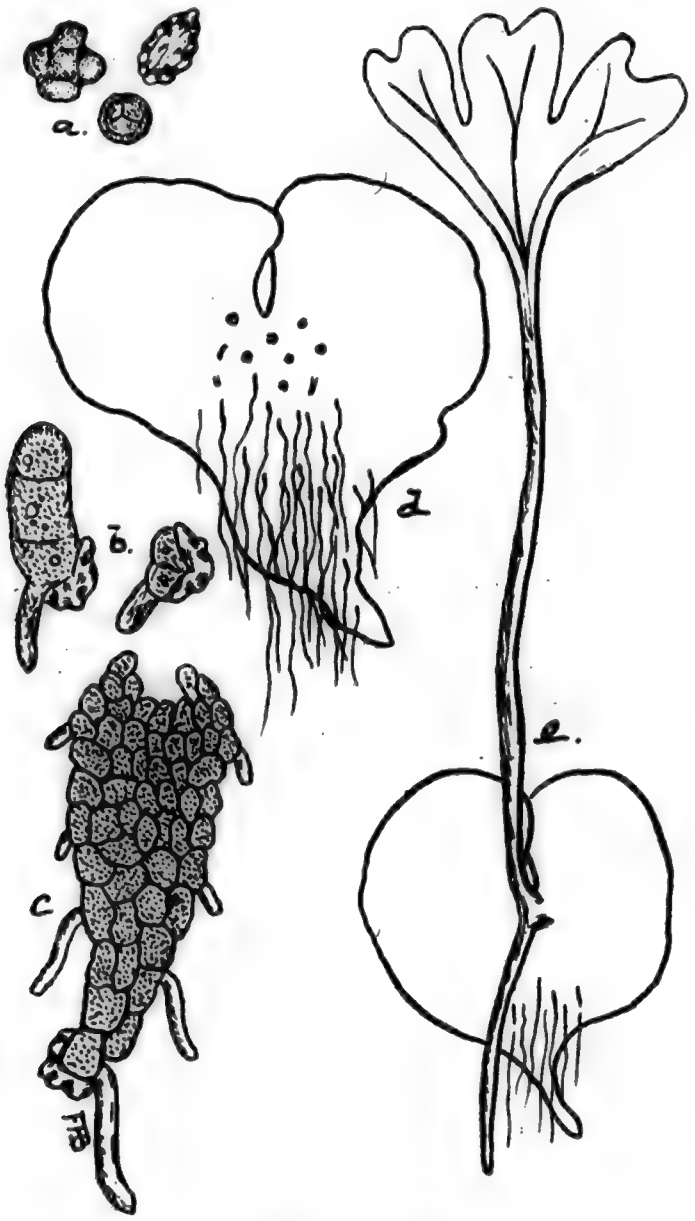
A VARIETY OF QUESTIONS.

The following comes from "S. S. F.":

"What is the proper temperature and place to keep seeds to preserve the germinating qualities?"

The length of time that seeds will keep their "germinating qualities" under the most favorable conditions varies greatly with the families or orders. For instance, it is generally conceded among seedsmen that parsnip is no good if more than one year old, while cabbage and turnip, the Brassica family, are good for four or five years, and cucumber and squash much longer; in fact, if seed will keep ten years, why not twenty, and if twenty, why not 2,000? In air-tight packages, in a cool but perfectly dry temperature, is the best place to preserve the vitality of seeds.

"Is it advisable to plant chrysanthe-



mums in the same soil that carnations have been growing in all winter?"

Scarcely advisable for the very best results, but often done, and if an addition of one-sixth of rotten manure and a pint of bone flour to one bushel of the soil on the bench is added before planting mums, you should produce good flowers, providing it was good soil to start with. The most particular thing would be to see that the soil was in the proper condition when you threw away the carnations and prepared it for the mums. If wet, and you worked it while in a sticky state, you would ruin it for any purpose, and could only be cured by a freezing. See that the bench is dry or fairly dry before you handle it.

"Which is best for growing roses and carnations for cut flowers, the overhead flow pipe system of heating or a pipe under the bench?"

This has been discussed by profound thinkers of the profession for years and at such length that it seems presumption for me at this late date to pass an opinion, but as I am asked the question and have decided views of my own, will say that for carnations neither a pipe above the plants or under the bench is in the right place. On the sides of the house two feet away from the plants is the proper place for the pipes, whether it be steam or hot water. For roses, I would say precisely the same. The man who would build benches against the walls of the house and pipes under them for growing flowers is a back number.

W. S.

Development of Young Fern.

YOUNG FERNS THROUGH A MICROSCOPE.

Every gardener knows full well that ferns start from spores. Upon the underside of the leaves of such ferns as dicksonias, aspidiums and polypodiums, the spore-spots are produced in quite regular order. They look like small heaps of brown powder or perhaps more nearly like the sawdust produced by bark-boring insects. The writer has been asked many times what these brown spots are, and there was often much surprise and occasionally some little doubt when informed that these spots are the "nests" where the ferns rear their young.

With a hand lens these spore spots, called sori by the botanists, consist usually of small bodies that are raised upon short, slender stalks and packed together so closely as to make a tuft. Each of the projecting bodies is a spore case and is shaped somewhat like a tennis racquette with the net work made into a sac. In these sacs the fern spores are produced and escape by the rupture often with some violence thus scattering the spores.

With the above as a preliminary we are ready to consider the spore and note something of its growth into a fern plant. Unlike a seed a spore has no plantlet already formed within the two walls, but instead there is simply a mass of rich substance which is called protoplasm.

Similar to seeds, however, the fern spores require for their growth a good degree of moisture and heat and the presence of the air. Without any one of these three conditions the spore or the seed would fail to develop a plant.

That which takes place in the germination of the fern spore is the taking up of water and the bursting of the thick brown coat and then through the opening thus formed the inner thin wall protrudes and begins to become green. In fact two kinds of cells form, the one set producing a very thin green expansion, smaller than the nail upon a baby's little finger, while at the same time slender cells of a brown color grow downward and serve to fasten the thin green scale to the place of support.

That which is of greatest interest are the organs produced upon the small green scale above described. If we look at a pot of young ferns there is very little to suggest the parent ferns from which the gardener secured the spores. The whole surface of the soil is covered with a green growth more like a liverwort than a fern. A little later on small leaves begin to arise from the green coating upon the soil. If these young leaves are lifted from the mat of seedlings they will each be found attached to a minute kidney-shaped scale. In short the leaf has come from the scale, but not until a process has been gone through, which it is the purpose here to describe.

Upon the underside of each scale, called by the botanist prothallus, there are two sets of organs, which in use are allied to the pistil and stamens found in flowers. The organs that are like stamens produce instead of pollen a number of minute bodies that are provided with swimming organs requiring the high powers of the microscope for seeing them. These antherozoids, as they are termed, pass from the place where they are produced to the female organ, which consists of a cell rich in protoplasm and surrounded by other cells producing a canal leading down from the surface to the cell to be fertilized. The antherozoids pass down this neck and mingling with the protoplasm, cause a new life to develop in and egg-cell as it sometimes is called

View of the Greenhouses of Mr. F. Burki, Bellevue, Pa.

and it afterwards develops into the fern as we see it as an object of beauty in the greenhouse or elsewhere.

From what has been written it is seen that fertilization in ferns takes place when the plants are very small and before they take on the form commonly know as that of ferns. It also follows that any attempts at the formation of crosses or hybrids must deal with the prothallia and while they are young. The element that effects the cross is microscopic and goes from one young prothallus to another through the liquid that is to be found adhering to the underside of the green scales in the seed or rather spore bed. So small are these bodies that it would tax the most delicate hybridizer to make the artificial transfer of the antherozoids.

However, by growing any two kinds of spores that mature their organs of reproduction at the same time it is possible to effect an occasional cross, and at the same time know by the law of exclusion what the parents must be. In other words, if the spores of all other species than the two in question are excluded, and this is not easy to do as they are light as dust and may come in with the currents of air, it is reasonable to consider the union of characteristics of the two species as being due to hybridization.

In the engraving three fern spores are shown at a; the germination of the spores is given at b, while at c the prothallus is being formed. At d is shown a fully grown prothallus with the antheridia and archigonia seen as small dots above the portion where hairs are produced. The young fern plant is shown at e as starting from the scale-like prothallus and after this stage of development is reached there is no hope of crossing or making hybrids.

BYRON D. HALSTED.

Rutgers College.

SWITZERLAND TRANSPLANTED.

Flower-growing among the Alps of Allegheny County, Pa.

Among the most picturesque groups of planthouses in the country are those of Mr. F. Burki, of Bellevue, Pa., a suburban town about five miles from Pittsburg. They are situated on the sides and summit of one of the many water-carved hills, three or four hundred feet high, that overlook that historic waterway the Ohio River.

The houses run in various directions, although the exposures are mostly sunward, are of many styles and sizes, and the hill in some portions is so steep that the visitor feels that he is liable at any time to step off into space. On the grounds are two or three foreign-looking cottages, several oil derricks are still standing in the neighborhood, and this particular Alp is crowned by the fine brick residence of the owner.

There are 29 planthouses (one range does not appear in the illustration, being located on the slope of the hill beyond the stable), and 100,000 feet of glass was used in their construction. They are heated by steam from boilers placed at the base of the long hill, and fifteen men and boys are employed in the work carried on here.

Mr. Burki is a native of Berne, Switzerland, where he learned his first lessons in floriculture, paying for the privilege, is 45 years of age, and, to your reporter at least, was pleasant and communicative.

His holding here contains 16 acres, mostly on edge; and having given up the retail plant trade, he now grows chrysanthemums, carnations, roses, lilies, lily of the valley, etc., which are mainly sold at wholesale in Pittsburg.

W. T. BELL.

SECOND HAND PIPE.

I can get second hand 2-inch pipe for about one-half the price of new, but it is painted. Will the paint act as a non-conductor, or will the new pipe radiate enough better to pay the extra cost? SUBSCRIBER.

I would not advise the use of the sec-

ond hand wrought iron pipe under any circumstances. The life of this kind of pipe is short enough at the best, and the paint on the pipe under consideration will so retard the radiation as to necessitate the use of considerably more pipe to secure the same results as new pipe, and thus raise the cost almost to that of new pipe.

H. W. GIBBONS.

New York.

Horticultural Hall, Audubon Park, New Orleans.

NEW ORLEANS NOTES.

Ushered in with lovely, springlike weather, the carnival of Mardi Gras was a splendid success, the coffers of the florist and decorator coming in for their share of the business, for while the Queen of Flowers is blooming out of doors, the demand for choice stock grown under glass was even greater than in former years. Virgin's Beauties were in big demand, and any other good thing brought good prices. Decorations were on an extensive scale, both Messrs. Virgin and Cook having all they could attend to of the large jobs, while the balance was pretty evenly divided among various members of the craft.

Owing to the mildness of the season, vegetation is far advanced, and while danger of frost is not past, still nothing serious is now looked for. The usual quota of mosquitoes are perchance harbingers of spring. They are pretty busy.

The magnificent palms, for which this city is noted, are in full growth. Beds of pansies and roses are in full bloom. M. Niel, Reine Marie Henrietta and Lamarque vie for honors with the capital stock being grown under glass by Mr. Virgin, who last summer built some rose houses, and has met with decided success in this new line. He will enlarge the place next season.

There are several private collections of choice plants, but really only one public greenhouse in the city, well named the City of Palms. Horticultural Hall is situated in Audubon Park, and is a relic of the exposition of '81. Many of the plants planted at that time are now of great size, and under the care of the untiring and well versed superintendent, Mr. Jules Fonta, whose picture in characteristic pose, together with some views of the park, is presented in this issue. Mr. Fonta is a gardener of the old school, first serving a period in the business in France, from which country he came to this city and embarked in business before the war, at which time 75 cents was paid for a geranium in a 4-inch pot; a heliotrope of same size brought a similar figure. The care of Audubon Park is his first public charge, and the many advances made in the march of improvements testify to the wisdom of his appointment.

Mr. Jules Fonta, Supt. Audubon Park, New Orleans.

I met Mr. J. M. Gasser, of Cleveland, who with his family was taking in the carnival, stopping off en route to the City of Mexico. He expects to be home by April 1.

W. M.

TEA ROSES FOR PROFIT.

[Extract from a paper read before the Chicago Florist Club, March 10, by Mr. Fred Hills.]

To be a successful rose grower one must have confidence in his own judgment. Always willing to take advice from his neighbors and from the trade papers, but carefully weighing it before putting it into practice.

In growing roses for the Chicago market, they should, in my opinion, be planted at equal intervals from the middle of June to the end of July, the successive plantings being to avoid so far as possible the evils of cropping. Go over the plants every two or three days and try as nearly as possible to pinch out an equal number of buds each time. By planting at intervals and careful pinching cropping can be largely done away with. At our places this year the cut of roses varies only about 30 per cent. That is, when the crop is on we cut 30 per cent more roses than when the crop is off.

Every grower aims to get his flowers in when prices are good. In my opinion the best way to do this is to pinch off all buds till about September 20, then leave all shoots that will make fairly good flowers and pinch off the poor ones.

In this way we get quite a number of flowers in October when there is some demand. Through the first two weeks in November we pinch off nearly everything so as to throw the crop well into December. The dull weather we usually get at that time of the year will carry the crop over Christmas. The first two weeks in January, when prices are low, the crop will be light, and will increase with the market till Lent. Again prices are

low and the crop will be off, but can easily be brought in for Easter.

To bring roses in at the right time will oftentimes need a change in the temperature. I am much against changes in temperature, but if your roses are in good condition, two degrees higher or lower for a week or ten days at a time will not do any great damage to the plants, and will often swell the returns. The main thing, in my opinion, is to keep the temperature steady.

We aim to keep a night temperature of 56 to 58 degrees, allowing it to run up to 72 degrees on bright days. Some growers who claim to keep that temperature think it all right to leave their fires until the last minute, and don't mind if the houses drop to 52 or 54 degrees so long as they get them up again. And in the daytime they would not think of moving the ventilators till the temperature had reached 72 degrees, and if it runs up to 80 degrees they put on more air and bring it down again. Good roses can never be grown in that way. Make the range of temperature from 56 degrees to 72 degrees, and on no account allow it to go above or below the extremes named. Start ventilating at 64 degrees and gradually increase until the temperature reaches 72 when give sufficient air to prevent it from going higher. In the afternoon keep taking off the air as the temperature goes down and close up at 64 degrees. I think that any grower who properly attends to the ventilating will be well repaid for his trouble. He will get stiffer stems, better foliage, larger flowers and finer color.

We water according to the condition of the stock, keeping the plants on the soft side, as they then break more freely and give more flowers.

Cutting roses is an important piece of work and should be done only by experienced hands. As soon as possible after they are cut place them in fresh water, and if the ends of the stems have become dry a piece should be cut off so as to open the pores again. If this operation is performed every morning and the flowers placed in fresh water they can be kept three or four days and still improve, providing they are kept in a temperature of not over 50 degrees.

Interior Views, Horticultural Hall, Audubon Park, New Orleans.

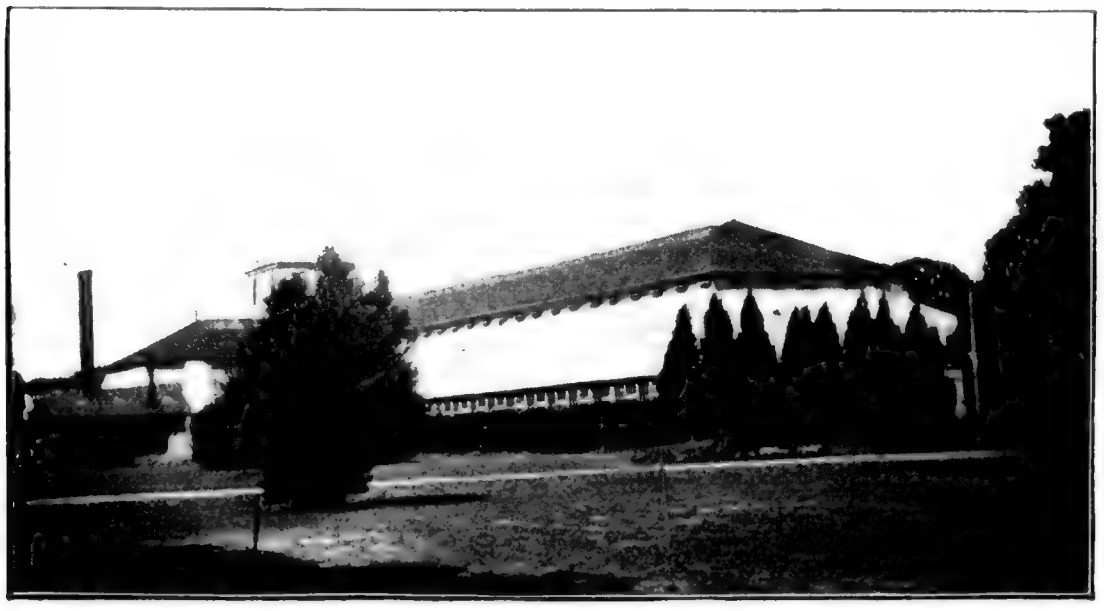
ROSES AT HINSDALE.

The roses at the immense establishment of Messrs. Bassett & Washburn, at Hinsdale, Ill., are in splendid condition, and promise an Easter crop of magnificent proportions. House after house of American Beauties are seen, all in the pink of condition, with canes that would do for fishing rods. This firm grows 50,000 plants of American Beauties alone and every one of the leading forcing roses is also well represented.

Mr. Bassett prefers to propagate the bulk of his Beauties in March. He can then get better wood and they grow on better. When propagated as early as December the wood seems to lack in life. Still, some plants are propagated thus early to provide stock for the earlier plantings which are made in April. Two houses are planted in April, and two in May, but the great bulk of the planting is done in June. For the main planting he would rather have a healthy growing 2-inch plant than one from a 3-inch. He finds they start away better.

Notwithstanding that so much space is given to the Beauty he considers Meteor decidedly the most profitable rose they grow. They have four large houses in the finest possible condition. With them this rose produces more freely and continuously than any other rose and they sell well in the market. They keep the temperature of the Meteor houses up to 70 degrees.

Brides and Bridesmaids occupy many houses, all in the best possible condition, and a house of Perles was the best the writer has seen in many a day at this season of the year. A house of Kaiserins will be in splendid crop at Easter.



A house of Pres. Carnot was tried this season, but it has proven very unsatisfactory. Mr. Bassett says they haven't cut $50 worth of flowers from the house all winter long. For Christmas they cut about 50 blooms, and practically none at all since.

Propagation of all roses is going on

ond hand wrought iron pipe under any circumstances. The life of this kind of pipe is short enough at the best, and the paint on the pipe under consideration will so retard the radiation as to necessitate the use of considerably more pipe to secure the same results as new pipe, and thus raise the cost almost to that of new pipe.

Horticultural Hall, Audubon Park, New Orleans.

NEW ORLEANS NOTES.

Ushered in with lovely, springlike weather, the carnival of Mardi Gras was a splendid success, the coffers of the florist and decorator coming in for their share of the business, for while the Queen of Flowers is blooming out of doors, the demand for choice stock grown under glass was even greater than in former years. Virgin's Beauties were in big demand, and any other good thing brought good prices. Decorations were on an extensive scale, both Messrs. Virgin and Cook having all they could attend to of the large jobs, while the balance was pretty evenly divided among various members of the craft.

Owing to the mildness of the season, vegetation is far advanced, and while danger of frost is not past, still nothing serious is now looked for. The usual quota of mosquitoes are perchance harbingers of spring. They are pretty busy.

The magnificent palms, for which this city is noted, are in full growth. Beds of pansies and roses are in full bloom. M. Niel, Reine Marie Henrietta and Lamarque vie for honors with the capital stock being grown under glass by Mr. Virgin, who last summer built some rose houses, and has met with decided success in this new line. He will enlarge the place next season.

There are several private collections of choice plants, but really only one public greenhouse in the city, well named the City of Palms. Horticultural Hall is situated in Audubon Park, and is a relic of the exposition of '81. Many of the plants planted at that time are now of great size, and under the care of the untiring and well versed superintendent, Mr. Jules Fonta, whose picture in characteristic pose, together with some views of the park, is presented in this issue. Mr. Fonta is a gardener of the old school, first serving a period in the business in France, from which country he came to this city and embarked in business before the war, at which time 75 cents was paid for a geranium in a 4-inch pot; a heliotrope of same size brought a similar figure. The care of Audubon Park is his first public charge, and the many advances made in the march of improvements testify to the wisdom of his appointment.

Mr. Jules Fonta, Supt. Audubon Park, New Orleans.

I met Mr. J. M. Gasser, of Cleveland, who with his family was taking in the carnival, stopping off en route to the City of Mexico. He expects to be home by April 1. W. M.

Propagation of all roses is going on

rapidly now and immense quantities of young stock are to be seen, all in unusually fine condition.

In one thing Bassett & Washburn have been peculiarly fortunate. They have never had any rose diseases to contend with. Mr. Bassett says he knows nothing about them from personal observation and adds that he hopes he never will.

NEW VARIETIES OF 1897.

Of pink varieties there were six that made their debut this past season, five of light shades and one a dark pink; Mrs. McBurney, Mrs. C. H. Duhme, C. A. Dana, Emma Wocher, Victor and Sloan, all meritorious and worthy of cultivation, but not of the value of Mrs. G. M. Bradt or Flora Hill. They will never be universally grown, as many other varietites, but will find preference in special localities. Owing to their inferiority and large number of much the same color, none of these varieties found a very large dissemination and are in some sections yet unknown.

If all the young stock was of the same quality as mine, those who are growing McBurney must have been agreeably surprised, for there was not much assurance of it being a healthy grower. Of a pale green color looking soft and full of bacteria I felt more inclined to throw them away than to give them benchroom. But conditions have changed very much; they made fair sized plants by fall, and have bloomed uninterruptedly, giving a fair crop of large blooms on good strong stems. The form of the flower is rather flat which may be considered a defect by many. The color is a pleasing light salmon pink and would be more decided if of greater purity, for by a close examination we find it very finely sprinkled or sanded with crimson. This will not detract from its general effect but by looking at it closely it is painfully observant. I have noticed this defect, if it may be called so, more in the early part of the season and now it begins to appear again. The flowers shown at the Chicago exhibition were fine blooms of large size and on strong stems. The habit is good. Foliage seems rather soft, of that undesirable pale green color and is very susceptible to bacteriosis, but under good treatment the plants will, in a short while, outgrow that disease. I believe this variety has not been very widely disseminated, and I will be wrong in my conjectures, if we do not hear more regarding it in the future.

Mrs. C. H. Duhme, much of the color of Albertini, is one of the earliest bloomers at our place, and makes a good substitute for Albertini, where that variety is desired, but which does not give satisfactory results on account of it being a late bloomer. We have grown it for the last five years, and it has given immense satisfaction in our retail trade, giving us nearly as many flowers as Scott, and more than twice the number of Albertini. It is not a first class shipper, and does not quite possess an up-to-date stem, but its merits consist in it being an early, free and continuous bloomer, its large flower of pleasing form and color, which make it a valuable variety for the florist who retails his own flowers, and depends on his own plants for a daily supply. We depend wholly on this variety for light pinks in our home trade. Growth is strong and habit very good. This variety is rather sensitive as to being kept too dry or wet, showing it quickly in the drying up of the points of the leaves. This I have found particularly when the bottom of the bench becomes too dry. It is a slow propagator, taking a longer time to root than most other varieties. It has always been a healthy grower with us and responds nicely to a liberal feeding.

C. A. Dana originated with us in 1892, being a cross between Uncle John and Scott, and sent out by C. W. Ward, Queens, New York. Desirable in every way, with the exception that the flowers were rather small I discarded it, but the stock sent to Mr. Ward improved very much, and as developed by him justified a dissemination. This variety is admired by many for its clear pink color and smooth petals, being only slightly fringed, more closely resembling the style admired in England. The stock sent us by Mr. Ward shows a very marked improvement over the original. It retains the free blooming qualities of its parents, the flowers much larger, of better form and stronger stem, making it a very desirable variety. This gives an example as to how a variety may improve in another locality.

Emma Wocher made quite a sensation at the Cincinnati exhibition, but is very little seen or heard of now. The plants we received were badly infected with rust. We tried to clean them and succeeded in so far that we have comparatively clean plants now. Our plants made a good growth and present a fine appearance, showing a healthy color; flower stems excellent; flowers a fine light pink color but only of medium size and at the same time not very full, often semi-double. This variety was reported as extremely free, which I believe correct, as the habit tends that way. Our plants bloom rather late, but for the same reason that all our carnations were late.

I believe Victor, the celebrated sport of Daybreak, has been more widely disseminated than any other of the pink varieties mentioned above, and gives general satisfaction. The color is several shades darker than Daybreak, a desirable acquisition but still remains in the range of the light pinks. It is claimed for it that it possesses more vigor in every respect than the parent variety. As our plants show up I cannot sustain this opinion for I see no difference except that of color, which is very decided. It is often the case that a new variety receives a little more care and attention, and this may account for a better appearance. At our place the choicest seedlings and the oldest varieties receive the same care, and our Daybreaks are still as good as they were years ago. So it is no disparagement to this sport when I say it is as good as its parent. It shares in the susceptibility to rust with its parent and the stock we received was very badly rusted. Daybreak has never shown any rust at our place, and I may succeed in seeing this variety clean also.

Sloan makes with us a good growth. The plant has a fine appearance, flower stems up-to-date, color a deep b ight pink, but the flowers have so far been of poor quality, lacking in substance, and showing that curling, incurving habit that makes them unsalable.

I will close my notes on the new varieties of 1897 with the variegated varieties Lily Dean and Maud Dean. Lily Dean is a beauty of large size and exquisite form and coloring, white with stripes and edging of a very pleasing shade of red. It lacks in stem and appears with us a little shy. We shall grow it again, as our trial of this beautiful variety has not been quite satisfactory this year.

Maud Dean appears with us worthless, as we have not as yet had any good flowers, but this will not prove that it will not be of value in other sections, as I have heard from several places where it is liked very much.

FRED. DORNER.

CARNATIONS AT HINSDALE.

While roses are the great specialty at the establishment of Messrs. Bassett & Washburn, Hinsdale, Ill., they grow an acre or so of carnations, just for variety's sake, so they say. Here Daybreak is seen in all its old time glory. But the new Mrs. McBurney gives promise of eclipsing it. Jubilee is, alas, badly infested with rust. In

spite of the rust some splendid flowers are produced but the blooms are not frequent enough to make the variety profitable here. Mrs. Bradt is considered the most profitable variety on the place. The blooms are certainly grand and have stems amply strong enough to carry the flower. In fact the stems on these flowers seem even stronger than on blooms grown by Mr. Dorner. They find sale for all the flowers they can cut at $8 per 100.

Flora Hill is doing grandly, but Mr. Bassett believes that Mary Wood, one of Mr. Dorner's seedlings, will excel it at their place. Mary Wood is a white, which shows pink in the petals when first expanded, but later turns to pure white. The flowers are very large, freely produced, with good stem, and certainly make a splendid showing here. Mayor Pingree produces some splendid blooms, but seems rather shy in blooming. Scott no longer does well here and is about to be discarded. Rose Queen and Minnie Cook were tried this season but didn't pan out. Triumph also failed to do well. Lily Dean and Maud Dean had a moderate share of space. The former made a very good impression but no place is seen for the latter.

The young carnation plants here are planted out in the benches instead of in flats or pots. Mr. Bassett says he has much better success with them in this way.

As to varieties to grow for next year Mr. Bassett says they will confine themselves to the fancy varieties that will bring a good price, and will let some one else grow the common sorts.

CHRYSANTHEMUM NOTES.

Just at this time, when all the flotsam and jetsam of plant life that has been drifting round the houses all winter is being rounded up and propagated for spring sales, it is well to remember to leave lots of room for the "mum" cuttings. Overcrowding them in the cutting bench saps the vitality out of them, weakens them and renders them susceptible to anything that comes along. Also be careful what cuttings you select for propagating. The suckers that come up out of the ground around the old stem are the best and as useful to the mum grower as the sucker of another species is to the bunco steerer. The shoots that form on the old stem, stem cuttings as they are usually termed, are of little use because they begin to throw buds as soon as they get to growing. Just as soon as the tip of the cutting begins to grow it will be found that the roots are about an inch long and they should be at once taken up and put into flats or pots. When cuttings are left too long in the sand after rooting they invariably make a spindly, wiry tip which never gets to growing freely and the object to aim at above all things is to keep your plants on the move right from the cutting bench till the flower is developed. Whoso doeth this thing will never fail.

All the cuttings it is possible to get of the slow growing kinds, like Mrs. Jerome Jones or Major Bonnaffon, should be put in this month. They do not make such a quick growth as the others and consequently take longer to develop. We have had some very fine flowers of Bonnaffon with a stem of only about 9 inches, but such a flower has hardly stem enough to sell well. Rooted now and grown right along Bonnaffon will give a stem two to three feet in length. Mrs. Jerome Jones also is mighty slow and this variety must be given lots of time, for if you attempt to rush it the flower is deficient in petals and mighty insignificant compared with what it should be.

If you are growing any plants for specimens they should be watched and potted on from 2½ to 5-inch pots as soon as they are ready. Never let them become rootbound, as such treatment only means a check. Use in potting good fibry loam mixed with a little wood ashes or burnt refuse, which will put a healthy gloss and dark color on the foliage. The top should be pinched out as soon as the plants are growing good and the object from now on should be to encourage the plant to make as many "breaks" as possible.

Black fly should be fought right from the first and the best means we have found to accomplish this is to burn tobacco dust in the house. We make four or five heaps in a house 100 feet long and light it by means of a little kerosene poured on top of the heap. It is better to have a few large heaps than a dozen small ones because the idea is to keep up a little smoke nearly all night which is much more effective and not so likely to injure any foliage as filling the house quickly with a dense smoke as is done in the old way by the use of tobacco stems.

The weather is beginning to get springlike, and artificial heat should be dispensed with as much as possible now. Give all the air you can in mild weather to keep the young plants sturdy and vigorous. C. TOTTY.

BUFFALO.

Reunion of Florists' Club.

There have been some events this past week that are worth mentioning, chief among which was the annual reunion of the Buffalo Florists' Club. The club has been simply hibernating for the past year, not dead but sleeping, and this has been through no fault of their officers, but a lack of interest by the members. First there was a short business meeting at which it was decided we should hold a fall exhibition; with or without the co-opera-

Giant Live Oak in Audubon Park, New Orleans.

tion of any society or charity organization was left to a committee to decide. The president, L. A. Anderson, insisted on declining a re-election and the members insisted on electing Wm. Scott to that high office. The rest of the officers hold over. With the view of a show in the fall and recuperation that a long rest should give, many rosy words of hope were expressed and it is needless to say that the president promised his level best to revive new interest, and work for general prosperity.

Then they adjourned to a spacious room where the first speaker was blue points on the half-shell and the last course was "Auld Lang Syne," also on the half-shell for the beautiful tenor who led the solo part had forgotten the words. There were several other things between the bivalves and bassos which appeared and disappeared without a struggle after the fashion of the well trained florists. There was a goodly number of our friends from adjoining towns, including Mr. Henry Niemeyer of Erie, Pa.; Messrs. Stroh of Attica; Thomas and William Mansfield of Lockport; F. B. and F. W. Lewis also of the lock city; Henry Wise of East Aurora; Mr. Burr of Harmon & Burr, Darien; Mr. Smiley of Attica; Mr. Morgan of Auburn; Mr. Larder of Fredonia; Mr. Sage of Red Rock, Pa.; Mr. Beatus of paper-box fame, and if there were other visitors, I trust they will forgive the omission of their names for it is entirely unintentional. Upwards of forty of us sat down to what turned out to be one of the most pleasant social gatherings in the history of our club. Decorations were lavish as they usually are when florists are interested, chief among which were several vases of magnificent roses sent by Mr. Peter Crowe of Utica. Large and grandly stemmed as these roses were, they were hardly appreciated as would have been the massive and finely colored proportions of Peter himself. Between the responses to the toasts songs were sung by Mr. Noonan, a tenor of rare purity, and Mr. Steve Rebstock, whose rich bass voice adapts itself to the comic as well as sentimental.

Your columns would not hold any comment on all the responses. W. S. was early installed as toastmaster and before adjournment had every one on their feet. The toasts were of a varied nature and one was not supposed to stick over close to the text. Mr. Anderson reviewed the late work of the club. Mr. Long spoke sensibly and earnestly on the club and its mission. Mr. Sage responded to "Natural Gas." Mr. T. Mansfield told how water flowed up hill and his son had the easier task of explaining why it went down hill. W. A. Adams supported the ladies in fine style, and L. H. Newbeck responded to "Diseases" particularly affecting lilies. He covered the ground well and thought too much water in the early stages of growth was partly the cause of our losing many lilies. Mr. Legg, our worthy secretary, answered to our Faithful Members most earnestly and ably. And then Mr. Max "Beatus" answered the toast Dreams of the Dreadful Drummer, followed immediately by Fred B. Lewis on Connivers in the Business. Mr. Niemeyer spoke eloquently of our New Prosperity. Mr. Kasting had, of course, to defend the Commission Man, which he did in his usual bright and witty way; and there were short talks from every one, including a very witty speech from Mr. C. Keitsch. His toast was the New American Beauty. He told us all about it and concluded a most amusing talk by telling us that it was a girl and she was almost 5 weeks old.

Mr. Long had gathered together a good array of most of the carnations offered this year and the visitors were much impressed with the fine appearance of Genesee. The absentees were few and insignificant, still they should have been there. Walter Mott and Dan McRory only missed it by 24 hours. Dan looks very rugged and very stout, evidently fattening on the rich orders he has taken on his western trip. To our great regret Prof. Cowell had to take an early train and left before the fun began.

A Remarkable Coincidence.

The past ten days will long be remembered as the most pleasant, even balmy, spell of weather ever known in the first days of March, and to that partially must be attributed the coincidence of which I beg a small space to relate. Tuesday, March 8th, beamed on us as a day in June. At about 10 a. m. were seen "poor Lo" with his basket of sassafras, a robin and a blue bird and the first Dutch bulb drummer of the season. This is about three weeks in advance of any season on record, particularly for the last mentioned. Our feathered favorites stayed but a few moments, just alighting on the highest twig of an apple tree and piping out in their lately acquired southern accent "Mornin', Bill," and then winged their tireless flight across Ontario's waters to the fields and orchards of the northern shores. Not so with the new arrival from Holland. He stopped to pick up a few incautious worms, whet his beak and tell a story. All readers of the newspapers will remember that a little more than a month ago the news flashed over the wires, or at least before our eyes, that the good ship Veendam of the Rotterdam line was lost in mid ocean and every soul saved by the American liner St. Louis. Mr. G. Krowell was one of the rescued. Mr. K is a very young man with plenty of animal spirits and aggressiveness, but when relating his experience, and it may be called impressions, for that's the sort of thing that does impress, you can see he is still thinking of his mother or perhaps a fair Holland lass, and perhaps his sins. On Tuesday evening, Feb. 6, a hole was knocked in the bottom of the Veendam (no suspicion that it was a Spanish mine or torpedo); at midnight her rescue by the St. Louis began, and in nine hours the three or four hundred of the Veendam were safely aboard the big ship, and each passenger had what he or she was enveloped in and no more. There is not a comfortable gang plank put from one ship to another. Oh, no, in a heavy sea it is an ordeal that only stout hearts will volunteer to face, and weak ones must or perish; first the women, then the other passengers and last the crew, and last man of all in this case the captain. "What," said he, "have you got there?" as Kaiser Kroon Von Kronwell placed himself in position to have the rope adjusted beneath his arms, preparatory to be let down into the tiny boat. "My papers, my catalogues that I do business with when I get to America." It was not an over large grip, but the captain sternly said, "If you value them highly you had better stay with them or get into the boat without them." I can swear that Mr. K did not stay with his baggage, but it perished in flames, as did the whole ship, that it may not bring disaster to another as some submerged wreck had so cruelly fouled the good Dutch ship. There is no moral to this tale only we infer from the quantity of Dutchmen who get here that few lives are lost on this line. Their literature we can dispense with and even if it is getting much colder.

W. S.

CLEVELAND.

Trade Fair.

Business on the whole has fallen off slightly from previous reports, but, considering the fact that we are now fairly into Lent, is not very bad. The quality of stock in all lines is very good and prices are somewhat off from former quotations in most lines although up to the time of this writing there has been no glut to utterly demoralize prices. Whether, with the steadily increasing supply, not only locally, but also in outside cities that ship here, this condition of affairs can be long maintained, is somewhat problematical. Let us, however, hope for the best.

Outlook for Easter.

In going through many establishments lately, a few observations regarding the outlook for Easter stock were made. There does not appear to be much stuff coming in for that occasion, that will be different from other seasons. Novelties of merit do not often appear nowadays and the trade here at least is very shy of experiments, a few valuable lessons having been taken to heart apparently from earlier disastrous experiments.

In pot plants azaleas appear to hold the highest place in everybody's estimation and the likelihood is that there will be an ample stock for all demand.

Corner in Cut-Flower Department.

Supply Department.

GLIMPSES OF THE WHOLESALE STORE OF VAUGHAN, McKELLAR & WINTERSON, CHICAGO.

Some lots, however, should the weather remain bright and warm, will probably be too early. Cinerarias, under normal weather conditions, will be in good shape although with some they show the same tendency as the azaleas. Lilies are somewhat uncertain. Many growers, owing to the heavy inroads of the lily disease, have a much smaller stock than in former seasons, and in some cases, what are to be seen, show evidences of serious trouble still to come in the way of crippled flowers. Other lots will need every day in order to be in soon enough and the weather will have to be very favorable even at that. With the variety of other stock and with fairly favorable weather there will be enough to answer requirements unless business should be phenomenally good.

Hydrangeas will in many instances be too late, or at least while they may sell, will be much too soft to give good satisfaction. A few lots look about right, but not many. Genistas, mostly in the smaller sizes, will be about the best stock offered in yellow flowers, though their tendency to shed makes them often unsatisfactory. Rhododendrons, spiraeas, deutzias, hardy roses and other similar stock will be offered to supply the demand for variety and seem to be in good supply and quality. Bulbous stock in pots and pans will of course be offered, apparently in about the usual quantity by various growers. In a few instances there will not be so much of this stock as in former years.

In cut flowers, so much depends directly upon weather conditions that it is not possible to say much, although there is little doubt that in roses and carnations there will be no shortage. It is possible that there may not be a very heavy crop of the latter as they stand now in such condition that they may be between two crops at that time. Should the weather be extremely favorable, it might hurry up the coming crop sufficiently to bring it in by Easter, but in any case the variety of stock offered at that time makes a shortage in one or two things of comparatively slight importance.

The weather has been steadily warm for a considerable time now and all stock is showing a vast improvement by reason thereof. Outside the trees and shrubs are beginning to swell their buds to a rather risky extent should a belated cold snap swoop down upon us a little later. There is, however, no use in borrowing trouble on that score just now. Florists have plenty of others to pick from.

Notes.

Miss Eadie has returned from her Florida trip and reports a very pleasant time.

Mr. McRory, representing W. A. Manda and Jos. Rolker, of A. Rolker & Sons, have been recent visitors. Mr. Van Leuwen, of Beerhorst & Van Leuwen, Holland bulb growers, also dropped in lately fresh from the other side.

Mr. C. H. Cushman and Mr. Adam Graham left town Monday afternoon to attend the Washington meeting of the executive committee of the S. A. F. Messrs. Elmer Smith, of Adrian and W. W. Coles, of Kokomo, also passed through en route for the same destination. NEMO.

ST. LOUIS.

Annual Carnation Meeting.

The March meeting of the Florists' Club was well attended on Thursday the 10th, this being our annual carnation meeting. The following growers made exhibits: Fred Dorner & Sons Co., Lafayette, Ind.; William Swayne, Kennett Square, Pa.; Hopp & Lemke, Grand Rapids, Mich.; Stollery Bros., Chicago; C. Besold, Mineola, N. Y.; Miss Flick, Fort Wayne, Ind.; R. Witterstaetter, Sedamsville, Ohio; John Burton, Philadelphia; J. F. Ammann, Edwardsville, Ill.; E. W. Guy and William Trillow, Belleville, Ill; John Steidle, St. Louis Co.; F. W. Ude and F. Richter, Kirkwood; Henry Aue, Lindenwood, Mo.; Frank Fillmore, St. Louis.

The meeting opened at 3 p. m. sharp, with all the officers at their stations. The chrysanthemum show committee reported progress, and are now in negotiation with the manager of the Coliseum for terms. Messrs. E. A.

Michel, F. H. Weber and W. Hucke were elected to membership. The president then appointed the following committee, W. C. Young, J. J. Beneke, R. F. Tesson and Secretary Schray, to negotiate with eastern florists' clubs to join us next August to attend the S. A. F. A. O. H. meeting at Omaha. The committee was instructed to begin work at once, as they only have four meetings in which to do their work before the annual meeting.

An intermission of ten minutes was called to look into the merits of the carnations on exhibition. The president appointed a committee of three to act as judges, as follows: Wm. Trillow, Frank Fillmore and J. J. Beneke. After ten minutes the meeting was called to order and the report of the committee was made, as follows:

Report of Exhibition Committee.

Fred Dorner's Gold Nugget, a grand flower, very fine yellow, and worthy of certificate; White Cloud, same grower, very good white, also worthy of a certificate; Wm. Swayne's Empress as a dark carnation was considered perfect, and worthy of certificate, the stems of this carnation averaging 3 feet; Chris Besold's Mrs. Frances Joost, flowers a little faded from its long trip, was regarded a fine pink, and worthy of certificate; John Burton's Alba Superba, a magnificent white, came in good condition, and was worthy of certificate; Hopp & Lemke's Kathleen Pantlind, a very attractive flower, almost the color of Daybreak, but more robust, was awarded a certificate. A fine grown plant of Kathleen Pantlind was also on exhibition, with fourteen buds, and attracted a great deal of attention. A large vase of Mrs. Bradt from Dorner's was greatly admired, and acknowledged the best seen of this variety.

R. Witterstaetter's exhibit consisted of a large vase of magnificent blooms of Evelina. This carnation is a great favorite with the St. Louis florists. Stollery Bros'. Argyle, a fine pink, came in for its share of admiration. The above two varieties already have the club's certificate.

The committee wishes to call attention to a vase of fourteen varieties grown by William Trillow (St. Clair Floral Co.), Bellville; a vase of good Daybreak and Scott by J. F. Ammann, of Edwardsville, Ill., and a vase of fifty finely grown Daybreaks by Miss Flick, of Fort Wayne, Ind. Henry Aue showed a vase of very fine mixed carnations. John Steidle exhibited three fine vases of well grown carnations. In one vase Mr. Steidle showed his sport from Daybreak, which the committee thinks is something good. E. W. Guy, of Belleville, had a large vase of fine Armazindy. Mr. Guy reports that this variety is doing well with him. F. W. Ude, Jr., and F. Richter, of Kirkwood, each showed a vase of good mixed carnations, and Frank Fillmore was also on hand with a mixed bunch which showed up well.

Fred Dorner, Jr., of Lafayette, Ind.; A Berdan, Kirkwood, and Charles Young, were our visitors. The Florists' Review was on file as usual for reference. The next meeting of the club, April 14, will be its annual rose show. John W. Kunz, the club auctioneer, sold the blooms on exhibition to the highest bidder. After this the meeting adjourned and a general introduction followed.

Observations.

F. W. Ude, Jr., was the proudest man in the hall after having become the sole owner of Kathleen Pantlind.

Chas. Juengel was very much taken with the Empress.

Frank Fillmore thinks Evelina the grandest of all whites.

Fred Weber walked off with Frances Joost as though he won a capital prize.

Emil Schray had his eye on the Gold Nugget, and was afterward seen with them on his way home.

Herman and Gus Ude had their heads together admiring Alba Superba and White Cloud.

John W. Kunz fell in love with Mrs. Bradt. She was seen in his show window later on.

President Halstedt was seen to admire John Steidle's sport from Daybreak. Doc thinks John has a good one, and should push it.

Max Herzog says that Miss Flick knows how to grow Daybreaks.

E. W. Guy is a great admirer of Armazindy, and Everett knows a good thing when he sees it.

Charlie Kuehn didn't say much, but thought his share. Charlie is a great admirer of fine carnations.

Fred Dorner, Jr., was the center of attraction, explaining the merits of his carnations.

Willie Jordan was on hand and helped Kunz wonderfully well in buying Evelina and Mrs. Bradt at a good round figure.

Bob Tesson thinks Argyle a good pink for the retailers to handle.

Julius Koenig, Jr., had a Bradt of his own, but when he saw Dorner's he shook his head.

Frank Ellis had an eye on Aue's mixed vase, especially Eldorado, which Frank thinks is a beauty.

Visitors in town were Mr. and Mrs. Unverzagt, of Springfield, Ill.; Meyer Heller, New Castle, Ind.; Fred Dorner, Jr., Lafayette, Ind.; Joe Rolker, New York, and Jos. Heinl, Jacksonville, Ill.

Market Review.

Trade in the cut flower line the past week slackened up somewhat and the long expected glut has arrived at last. Everything is plentiful now—even a few fine Beauties can now be had. Carnations are on equal par with bulbous stock and violets. Roses of all kinds can be bought cheap, but there seems to be very little demand. The commission houses are now looking for your trade. A week or so past we were looking for them, and should this state of affairs keep up the wholesalers will be fighting each other to see who can sell the cheapest. Roses of all kinds can be bought very cheap, and only the very choicest stock bring $4 and $5; the others sold at $1 and $2 per 100. Carnations are a great glut, and the price has gone down as low as $1 and $2 for the very best—more Daybreaks and Scotts than any others. Harrisii have dropped to $6 and $8; callas the same price. Dutch hyacinths are sold at $2 and $4. Daffodils meet with very little demand at $2; valley fair at $3. Violets of all kinds are being dumped every day and have little or no value at present. Sweet peas are very fine and are about the only flower in demand, and are held up at $2. Smilax is sold at $12.50 and $15.

Notes.

The Mound City Cut Flower Co., doing business at 1322 Pine street, made an assignment last week Wednesday for the benefit of its creditors. Jos. H. Barr is named as trustee.

George M. Kellogg, Pleasant Hill, Mo., spent Sunday in St. Louis. Mr. K. is on his way to attend the executive meeting of the S. A. F. A. O. H., to be held at Washington, D. C.

The Bowlers had a fine night Monday to bowl, but the attendance was not so good as usual and will not be from now on until after the spring trade is over. E. Schray was high man in the three games rolled, with 577; Helwig, second, with 496; Fillmore, third with 495. The highest single score was by Helwig, with 216; Fillmore, second with 209; Schray, third with 197. Next Monday night we roll for a cake. J. J. B.

CINCINNATI.

Florists' Society.

The regular meeting of the Cincinnati Florists' Society was held last Saturday evening. Although the weather was unfavorable the meeting was well attended and full of interest. The next regular meeting will be held on the third Saturday of April instead of the second, on account of Easter falling on the tenth of the month. It was decided to give a banquet at the club rooms about the middle of May to which the ladies will be invited. E. G. Gillett was appointed a committee of one to make the necessary arrangements.

Steps have been taken to form an auxiliary society for the benefit of the growers, it being thought that considerable money could be saved by so doing, especially in buying glass, coal, etc., as lower prices could be obtained by clubbing together and ordering large quantities. The boys all think well of the idea and it is sure to be a go. Wm Murphy, Albert Sunderbruch and Gus. Adrian were appointed a committee to complete arrangements.

Exhibition.

The exhibition of plants and cut flowers proved to be the most successful one given by the society this sea-

son. Not only are these exhibitions of interest to the craft, but the flower-loving public as well take advantage of the opportunity afforded them of admiring the choice collection of beautiful flowers.

F. Dorner & Sons, of Lafayette, Ind., showed Mrs. Geo. M. Bradt and White Cloud carnations both of which were well done. Messrs. George & Allen made a display of roses and bulbous stock. They also had a few choice varieties of fern plants interspersed with the cut flowers which made their exhibit an admirable one.

E. G. Hill & Co., of Richmond, Ind., had a few vases of choice carnations. The City Greenhouses made a general display of plants and cut flowers. Their azaleas and cyclamen were fine and deserve special mention. Fred Walz staged some seedling cannas which proved quite an attraction. Mr. Walz has quite a collection of these plants and knows how to grow them to perfection. Wm. Robertson, gardener for Mr. Schmeidlapp, showed some nice mushrooms and cucumbers, the latter measuring twelve inches in length.

Stollery Bros. sent a vase of their Argyle carnations which came in good condition. Wm. Murphy had on exhibition twelve standard varieties of carnations which made a good showing. A. Sunderbruchs Sons had a grand display of palms, ferns and lilies in pots with their cut stock of roses, carnations and tulips.

R. Witterstaetter exhibited a large vase of Evelina which never looked better. There seems to be no cessation to the blooming qualities of this grand carnation.

The past week has been rather slow among store men and the prospects for this week are not at all flattering. There is plenty of choice stock to be had with but little demand. Bulbous stock, violets and lilies are at a standstill. The shipping trade is only fair and is confined to roses and carnations. There was lots of good stock to be seen at the Sixth street flower market on Saturday but buyers were few owing to the rainy weather.

Wholesale prices are as follows: Brides and Maids $4 to $5, Meteors $6, Perles $4, tulips $3, daffodils $3, Dutch hyacinths $2 to $4, callas $8, Harrisii still bringing $12.50, valley $3, violets 50 cents, carnations, ordinary $1.50, fancy $3. B.

NEW YORK.

American Institute.

The carnation exhibition of the American Institute held last Tuesday brought out several novelties hitherto not seen before in this vicinity, some of them being of unusual merit, also some excellent vases of standard varieties. Mr. A. Herrington, of Madison; Mr. J. Withers and Mr. C. H. Allen were the judges. In the evening Dr. N. L. Britton delivered an illustrated lecture on "Leaves and Flowers," which was well received.

The Exhibits.

E. G. Hill & Co., Richmond, Ind., sent America and James Whitcomb Riley, both of which arrived in excellent condition, considering the distance shipped. The first named received a certificate of merit, its strong habit, stiff, erect stem, large flowers of a somewhat uncommon and very pleasing red, appealing specially to the judges. J. W. Riley is already certificated.

J. Towell, Paterson, N. J., sent Governor Griggs, recently described in our columns, and some unnamed seedlings, the former receiving a certificate.

Frank Niquet, Patchogue, L. I., exhibited Maud Adams, which was certificated.

J. & R. Leach, Jersey City, N. J., showed Scarlet Wave, a sport from Tidal Wave. This will undoubtedly be a very fine commercial variety for provincial towns, as it is a tremendous cropper. The flowers of red are smaller than the general run. It, however, scored well on commercial points.

D. B. Long, Buffalo, exhibited Genesee. This is the first time seen here, and it made a good impression.

C. H. Allen sent Ada Rehan, deep pink, and an excellent keeper from appearances, and a handsome vase of William Scott.

William Swayne, Kennett Square, Pa., exhibited his Empress, an excellent dark maroon fringed variety of great fragrance, that attracted considerable attention.

Mrs. Turner, Tarrytown, N. Y., exhibited a pretty pink seedling from McGowan and Scott, recommended for trial.

C. Besold, Mineola, L. I., showed Mrs. Frances Joost, which was awarded a certificate; also Helen, for the first time, and some seedlings.

C. W. Ward, Queens, L. I., sent his standard varieties, John Young, Bon Ton, White Cloud, New York, Mrs. G. M. Bradt, and Mrs. James Dean, which made an excellent showing. Bon Ton received the Institute's certificate, a thoroughly deserving variety; the others have received honors at previous meetings.

Club Meeting.

In spite of "war" talk, the meeting of the New York Florist Club was well attended, nearly fifty members and visitors being present. The competition for the club medals brought out a grand lot of orchids in flower and other worthy exhibits. Owing to President Plumb being called home on account of sickness in his family, the vice-president, Mr. John M. Logan, presided.

Prof. John B. Smith, the lecturer for the evening, was next introduced, his subject being "Greenhouse Pests," and he handled the subject in a masterly fashion. He compared the difficulties of indoor and outdoor application of insecticides, and mentioned the different methods of applying same; also going into a detailed description of the physiology of some insects, their methods of breeding, etc. He touched on the San Jose scale and the legislation affecting same; also the new disease, "Certificatos," which the florists were likely to be burdened with. In a later issue, however, we hope to be able to give the essay in full as delivered by Prof. Smith. Enough to say that it was well received, and the club's hearty vote of thanks was tendered to him by a standing, unanimous vote of the members present.

After the lecture, Presiding Officer Logan, who has just returned from his native heath, and in his "bra Scootch," called the meeting to order.

The committee on legislation reported favorable progress.

The gentlemen proposed at the last meeting were unanimously elected, and the following proposed: F. W. Bruggerhof, president of J. M. Thorburn Co., New York; Simon Hamburger, president of the Am. Jadoo Co., Philadelphia; Joseph A. Gorton, of the Gorton & Lidgerwood Co., New York; A. Herrington, Madison, N. J.; Herman Hepple, Nutley, N. J.; C. Besold, Mineola, L. I.; John Scott, Brooklyn; Louis Dupuy, Whitestone, N. Y.; H. W. Barfend, Westchester, N. Y.

The standing committee on awards, consisting of A. Herrington, Julius Roehrs and L. Hafner, acting as judges, then made its report.

The Exhibits.

Thomas W. Weathered's Son exhibited a new patent adjustable fastener for attaching to wood or iron rafters, and holding wires in place for vineries, etc.; a simple and neat invention, awarded certificate of merit.

W. R. Manda showed an excellent collection of orchids in flower, and a collection of dendrobiums in fifteen varieties, which was awarded a certificate of merit, the whole being a very worthy exhibit.

Mr. Peter Fisher showed his new carnation, Mrs. Thomas W. Lawson, which comes nearer to being perfection of any carnation I ever saw. Color deep cerise; rigid, erect stem, and grand foliage. Owing to the rules of the club, it could not be awarded a certificate, though an impartial judge gave it 98 points under the carnation schedule of the C. S.

D. H. Darlington, Flushing, L. I., showed a pretty specimen of Erica Cavendishii, proving that nearly all the varieties of this class of plants do well on Long Island.

Mr. E. M. Wood, of Boston, who was present, was then called on to say a few words, and in the course of his remarks said that not many years ago he used to see in the florists' windows of New York Boston roses for sale, but the order of things was reversed, and New York roses were sold in Boston since Pierson pierced the city. He congratulated the florists and the club on its progress and thanked them for their courtesy.

Our Special Wholesale Report.

The market last week was without a redeeming feature. With an abundant supply and receding prices, the prospect is anything but encouraging for some weeks to come. At the present writing shipments of roses are rapidly increasing, a consequence of the continued warm weather.

Special grades of Brides and Maids were sold last week from $8 to $10, and they have not yet touched their lowest point. All red roses are moving slowly. Long Beauties, the top quotation of which is $40, are selling down to $25. Meteors are hard to clear at respectable prices. Jacks are going slowly at low figures. The few Baroness coming into the market are readily sold at $25 to $50.

Carnations fare better than most anything else, and hold a fair price. Fine Scotts have the preference, and bring $1.50 to $2 per hundred. The fancy sorts do not bring a steady price, as the demand for expensive stock is limited. Sweet peas are coming in in larger quantities and sell well.

There is a very light demand for bulbous stock. The price of valley has weakened again, fine stock bringing but $1 to $1.50 per hundred. Harrisii are more than plentiful, with few sales. But little can be added to last week's report on violets, except that the supply increases, and the price is anywhere from $1.50 to $4 per thousand.

For average prices, see New York market.

Various Items.

Mr. W. H. Gunther has suffered a severe loss in the death of his father, and has the sincere sympathy of all the trade. Mr. Gunther himself is on the sick list with an attack of the grippe.

J. P. Cleary & Co. held a very successful sale last Tuesday, and prices realized were good. Mr. John's voice, which has been hibernating all winter, was as dulcet as the song of birds in spring.

Mr. Robert Simpson, manager of the greenhouses of Mr. Thomas Young, Jr., of Jersey City, has a number of greenhouses (nearly 20,000 square feet) at Clifton, N. J., where he will make a specialty of Beauties, carnations, etc.

In my gyrations in the vicinity, I have noticed quantities of the Palmer hotbed mat, and have heard it spoken of very highly as being practically indestructible and all that is claimed. It will undoubtedly replace the old-fashioned straw mat in the future.

Visitors.

Geo. Fancourt, Wilkesbarre, Pa. George is on a tour of inspection, and will visit several cities in the east, also Atlantic City, where he will rest for a few days.

E. M. Wood, Boston, Mass., on his way to attend the meeting of the executive committee of the S. A. F. A. O. H., Washington, was a recent visitor. Also Harry Ayres, Albany, N. Y.; T. J. Totten, Saratoga, N. Y.; J. G. Esler, Saddle River, N. J.; Peter Fisher, Ellis, Mass.; Oliver J. Poppy, Sing Sing, N. Y.

New Jersey Notes.

Mr. A. Herrington, Madison, reports sales for Frank Hardy as being very large. He has shipped as far as to California, and to several countries of Europe.

A visit to John N. May's, Summit, N. J., found that place in excellent shape for Easter. The rose Clara Watson, as seen growing, shows a strong and vigorous habit. The young growth has almost the color of the sunset, the flowers are elongated, and of a beautiful pink color, shaded with salmon at the base of the petals, the color intensifying as the blooms age. It will undoubtedly prove a valuable commercial variety, as from reports it keeps excellently.

Lager & Hurrell have been cutting a tremendous amount of cattleya flowers, which they have marketed at good prices. They are expecting some heavy shipments of imported orchids, chiefly cattleyas. They also contemplate building in the spring.

J. & R. Leach, Jersey City, are much elated over the success they are having with their new carnation, "Scarlet Wave." When I called they had just cut 800 blooms from a bench 8x94, and the bed looked like a field of wheat. They cut 1,500 at Christmas, and the average cut is always good, and will average 25 flowers to a plant. They handle a large stock of pelargoniums, Victor, dark red, being the variety, grown.

PHILADELPHIA.

Review of the Market.

Several unusually warm, springlike days, unusual for the second week of this windy month of March, have so encouraged stock that we have experienced a "glut." Not quite a good old-fashioned glut, but enough to give a taste of what will come after a while. Prices have fallen a little, yet the market requires a good proportion of the stock which reaches town in salable condition. Roses must be cut with judgment on these warm days to avoid loss. The retailers will not touch blooms that will fly open two or three hours after they are put in water.

Easter Outlook.

The outlook for Easter is bright, excepting as regards lilies. So many of these were carried off by the disease and so many more are affected that there will not be nearly enough to supply the demand. One bright storekeeper has shown his appreciation of this state of things by buying his regular supply two weeks ago. Another has presumably done even a little more, taking one grower's entire stock of 2,200 plants. It seems probable that the shortage in lilies will increase the demand for other flowering plants, of which there is a splendid collection in fine shape.

Building.

Building operations are already commencing, though frost is scarcely out of the ground. Myers & Samtman have contracted for another Beauty house to be finished by May first, so that their customers can have fine Beauties all the year round without peradventure.

It is also rumored that Edward Towell, of Weldon, who has been sending in some fine Bridesmaids to Smith & Whiteley, has been seen in the neighborhood of the wholesale glass houses downtown.

Notes.

The stores have almost an Easter blaze of color now. Azaleas, cinerarias, tulips and daffodils are seen in profusion, making the interiors most attractive.

Pennock Bros. made a beautiful and novel effect with a bunch of Mme. Chatenay rose and Acacia pubescens in their show window.

Our bowling team has shown perseverance equalled only by G. C. Watson's now famous effort to ascertain whether Flora Hill is better than John Burton's Alba Superba. They not only went up to third place in the inter-club tournament by successive victories over the Harmonic and Star teams, but they now hold the record for the best team and best individual score of the tournament to date. All honor to the popular Dr. Goebel, who has identified himself with the Florists' Club for many years. It is supposed he must have given each member of the team what huntsmen call "a leaping powder," sometimes erroneously thought to be brandy and soda, but really a mild effervescent fluid, taking a double dose himself.

Here is the score of the great game wherein Harmonics were vanquished on their own alleys by nearly 300 pins:

A. L. Brown	168	163	168—	499
D. T. Connor	168	216	184—	568
Chas. Longinette	156	175	192—	523
Theo. Palms	247	172	198—	617
George Goebel	241	209	199—	649
J. D. Habermehl	173	212	214—	599
Total				3,455

Doctor, will these powders help us to do a little better than our best when we have serious work to do?

J. W. Y.

Easter Stock.

The stores have quite a Lenten appearance, daffodils predominating. I understand these are selling very well. Dutch hyacinths are moving slowly, and with the present warm spell will crowd the market, which is quite steady at time of writing.

A visit to the growers shows unsurpassed stocks of azaleas and hydrangeas. Lilies are almost a failure so far as fine stock goes. Messrs. Craig, Becker and Harris are the largest growers of flowering stock for the stores.

Hugh Graham has a superb stock at his greenhouses to supply his own trade, which promises to be as large, if not larger, than usual. He has, I believe, the only big stock of Acacia pubescens in the Union. They are noble plants. A fine lot of Acacia armata at H. A. Dreer's Riverton place is in fine shape for Easter, also azaleas in various sizes. A big batch is set aside for orders booked ahead. I am much interested in the acacia, and learned from Mr. Eisele (whom I found looking anything but "dreary," owing, no doubt, to the splendid shipping season the firm is passing through), that this plant has a most interesting history, being used in connection with some function during the reign of Hiram, king of Tyre. It makes a grand plant for Easter, and will doubtless be grown more extensively in connection with the heath family than it has hitherto been done here.

I bandied Mr. Eisele on those pretty arecas, of which I saw a big supply in the store of "Our John"—"Holy John," as he is described by the newspapers, for the reason, I suppose, that he does not advertise in their Sunday issues—but was informed that although he had several tempting offers to supply such stock, he had refused the tempters' charms, and really believed the trade appreciates this fact.

On my return I priced more closely and found Mr. Wanamaker made quite a profit upon the deal—much more than the grower who supplied the plants, and whose price I had. Azaleas, for instance, are priced at $1.25 and $1.50, ordinary size, which is sold at wholesale for $35 per 100. Is it the charms of the sweet dames employed as salesladies that act as incentives? I inquired of this particular charmer how long and how often the plant which I was examining, and which was in extremis, would bloom. She replied it would continue to bloom about eight weeks, and flower every year and every other year, at which remark I was puzzled, and presumed to tell her she must mean every other year, if at all, at which she waxed indignant. But seriously, I do not believe it affects the legitimate trade to any appreciable degree; rather it should help it along. The opinion of our friend, E. L. S. Dale, upon this point would be valuable. M.

CHICAGO.

Club Meeting.

Roses and violets were the subjects of discussion at the last meeting of the Florists' Club. Extracts from the paper, by Mr. Fred Hills, on growing tea roses for profit appear elsewhere in this issue. In the discussion that followed Mr. Chas. Held spoke of the wisdom of providing for a crop for the latter part of June when there is a good demand owing to the numerous school closings at that time. Mr. Anthony thought it would pay growers to carry a few houses of plants in solid beds in the old-fashioned way and bring in full crops at periods of great demand. Mr. Stollery said his experience with carried over plants had been very unsatisfactory, but they had been on raised benches.

In his paper Mr. Hills had referred to the statement made in Mr. Anthony's paper at last meeting that fully 40 per cent of the flowers cut by the grower never reached the consumer, and it brought out a lively discussion, and many good natured retorts between the retailers and the growers, Mr. Hauswirth taking good care of the retailers' side of the question.

In the center of the room stood a vase of magnificent Bride, Bridesmaid and Morgan roses brought by Mr. Hills, and they were substantial evidence that the methods of the essayist were decidedly successful at his place.

No paper on violets had been prepared but there was a very interesting discussion. Mr. G. Swenson, of Elmhurst, brought to the meeting a bunch of superb Marie Louise violets which excited the admiration of all present. Mr. Swenson says he grows all his violets in frames. He propagates his plants in August, winters them in frames, grows in the field the following summer and the second winter gets his flowers in the frames. When picking flowers in cold weather he uses a light box frame covered with canvas, the frame of a size to fit over one sash and tall enough to allow him to stand inside. Under this cover he can pick the flowers under one sash without exposing the whole frame to the weather. He has never had any trouble from disease.

Mr. Stollery related his experience with violets as follows: One year he had space to spare at the end of a carnation bench and he filled it with violets. During the season he cut from his 275 plants 12,197 violets which realized $121.72. He concluded that violets were just what he wanted, so next year he put in a whole house, and gave them special attention. During the season he cut from his 900 plants a total of 5,445 flowers which netted him $44.15. That settled the violet for him. He felt it was too uncertain a quantity to take chances on.

Mr. Rudd gave a humorous account of his attempts to grow violets. He had heard a good deal of "the violet disease," as though there was but one. He was of the opinion that there were eight or nine different diseases and was sure his plants had them all.

Geo. Baldwin, of Oak Park, displayed at the meeting a Chinese primula in a 6-inch pot bearing nine trusses of flowers. Also a pot of narcissus, remarkably well flowered, and cut blooms of narcissus in variety, freesias, triteleias, and other flowers.

Messrs. G. Swenson, Elmhurst, Ill., and D. F. Hawkes, Wheaton, Ill., were elected to membership.

At the next meeting, March 24, Lilium Harrisii and other bulbous flowers will be discussed. A feature will be a paper on the Harrisii disease by Mr. E. Buettner.

The committee of arrangements for the recent carnation convention has issued to the contributors to the fund a printed itemized statement of all receipts and disbursements. Accompanying same was a check for 25 per cent of the amount subscribed. This is certainly a remarkable record and the committee will be fully warranted in shaking hands with itself. Certainly the donors to the fund feel like shaking hands with the committee.

The Market.

The supply has shortened up some and prices are stiffer. Extra teas go as high as $6, and good ordinary go at $4 to $5, with seconds at $3. Beauties are in heavy demand, especially the extra long grade. Everything seems in good demand, even in bulbous stock there is no surplus. Violets seem the only exception, these being dull. Smilax is scarce. Bassett & Washburn are cutting some extra Beauties, but all go quickly. Carnations hold stiff, and sales below $2 a hundred are rare.

All the wholesalers seem well satisfied with trade this winter. There have been no gluts at any time so far, and there is no indication of any at this time while the outlook for Easter is excellent. Kennicott Bros. Co. report business so far this month as a very marked increase over the same period a year ago.

Various Items.

E. H. Hunt has reopened his old stand at 68 Lake St. for the retail seed business during the spring months.

Fred Ostertag, of St. Louis, is in town, with the view of locating here if a suitable opening can be found.

Lloyd Vaughan, of Vaughan, McKellar & Winterson, has returned from his trip on the road, but will start out again next week. He reports good business.

Recent visitors were E. H. Baker, Goshen, Ind., and Miss Coulter, of Valparaiso, Ind.

Sam Peiser, the north side florist, has been spending a few weeks at West Baden, Ind.

Walter Kreitling says he is like a chrysanthemum—pretty to look at but without a cent.

W. W. Barnard & Co. have opened a branch store at 191 W. Randolph St. (Hay Market Square) for the accommodation of the market gardener trade.

Samuel Rubens, for many years with Kennicott Bros. Co., died at his mother's home, 35 Milton avenue, at 6 p. m. last Tuesday. The funeral will be held at 1 p. m. today (Thursday).

The firm of Winter & Glover, wholesale commission florists, was dissolved March 16. Mr. Glover retires and the business will be continued by Mr. Blair Winter, the senior member of the former firm.

BOSTON.

A Visit to Westerly.

Last Thursday a party, consisting of Messrs. P. Welch, E. M. Wood, Thos. A. Cox, Warren Ewell, Wm. Edgar and M. H. Norton, paid a visit to the establishment of Mr. S. J. Reuter, at Westerly, R. I. The party was met at the station by Mr. Reuter and driven to his residence, where a tempting luncheon was served, after which the greenhouses, containing 160,000 feet of glass, were inspected. The glass is devoted chiefly to roses and carnations, and all are in fine, healthy condition, producing large quantities of first-class flowers. Among the carnations were noticed Daybreak, Scott, Thos. Cartledge and Alaska. Mr. Reuter expects to strike 100,000 of carnation cuttings for stock and sale, and those already rooted are in fine condition.

Mr. R. has rather a novel way of treating his young plants. After taking from the cutting bed and potted in small thumb pots, when they are well rooted, he turns them out of the pots and places them close together on the benches, without breaking the ball, which gives them the appearance of being planted out. When orders come in for shipping, they are easily taken out in the ball, and being so well rooted, pack in good shape, without the ball breaking. He says that by this method of treatment he never has a complaint from damage through shipping. His two largest houses of roses, Brides and Bridesmaids, are in very fine condition, both in foliage and flower.

After inspecting all the houses, the party was given a very enjoyable ride around the city to points of interest, and when they took the train for home, much satisfaction was expressed at the way in which they had been entertained by their generous host.

Mass. Hort. Society.

At the weekly exhibition of the Massachusetts Horticultural Society last Saturday, James Comley was awarded a gratuity for a fine display of camellias, azaleas, Himalayan rhododendrons, Polygala cordifolia (a very pretty old greenhouse plant), Cattleyea Trianae and hybrid roses.

Mr. H. T. Clinkaberry, gardener to C. G. Roebling, Trenton, N. J., showed a remarkably fine spike of Cypripedium Rothschildianum, Trenton variety, with four flowers on the spike, for which a silver medal was awarded. Mr. J. E. Rothwell, Longwood (John Mutch, gardener), showed a very fine well grown plant of Cypripedium Lathamianum, also Cyp. Sallierii negro-maculatum, a fine plant in good flower, and Odontoglossum crispum, with a fine spike of flowers of good form and color. A gratuity was awarded. H. A. Mansfield, Newtonville, showed two vases of very fine La Marque roses from a plant forty-three years old. Rea Bros., Norwood, showed a new rose, a semi-double flower, which they called Pink Rambler. Farquhar Bros. again showed Narcissus Victoria, which was a great attraction. Mrs. P. D. Richards, West Medford, again brought her beautiful collection of water color drawings of native orchids and a collection of native mosses and other plants.

The Market.

The retail florists say business is "Lent" until Easter time, then they hope to have a good harvest. Business has certainly been very dull during the last two weeks, with very little prospects of better trade during the month of March. Still flowers of all kinds keep coming in on the wholesalers and find a market somewhere or other, but bulbous stuff is a drug, and some is hardly salable at all. Prices range about the same as last week for well grown stock.

Various Notes.

Mr. E. Sutermeister, Hyde Park, has been appointed assignee of the business of Fred Hiatt, Beacon street.

Mr. J. R. Fotheringham, representing F. R. Pierson Co., Tarrytown, N. Y., is in town. C. H. J.

WANT ADVERTISEMENTS.

A FIRST-CLASS MAN is now open to engagement fully competent in every respect; expert grower of both plants and cut flowers; wants an opportunity to better himself; no object to change unless there is an opportunity for him to show his abilities on a scale that will make his services worth at least $75 a month. Cypress Greenhouse Material.

We are the pioneers in Clear Cypress Greenhouse Material. We discovered that Cypress is better than any other wood for greenhouses from top of posts up and we introduced it, and fought for it against many prejudices, and finally succeeded in bringing it into general use.

Others have attempted to follow where we lead, others are trying to reap what we sowed, but we have the experience and are recognized as experts in greenhouse construction.

SPECIAL SPRING NUMBER
to be issued next week.

TORONTO.

The continued mild weather has given the market men a chance to get there and do a little business. They can sell a class of stuff down there that can hardly be sold anywhere else, and as greenhouse space is a great consideration, they can clean stuff off which would otherwise have to take a back seat or probably be thrown on the dump, though there is also a lot of good stuff sold there too.

The Gardeners' and Florists' Association at its regular meeting on Tuesday evening will wrestle with the Chrysanthemum Show prize list as suggested by the executive committee.

Some magnificent roses are being shown in the store windows now and trade still keeps fairly lively. Some good carnations are also being shown.

Mr. Geo. Reeves, of Reservoir Park, is putting his collection of stove and greenhouse plants in good order again. They are in a fair way to make their mark at the various flower shows.

The rate war between the C. P. R. and G. T. R. is bringing a great quantity of people to the city and business generally is in consequence brisker than it has been for years. Your correspondent is also taking advantage of the cheap fares and will take a month's holiday on the Pacific coast (not Skaguay, though). E.

ST. PAUL, MINN.

Market Resume.

Stock is more plentiful than for some time, though there is no glut of the market. Violets are very much in evidence and wholesale prices on some are down, good stock selling at 40 to 75 cents per 100. Harrisii are more plentiful, while there is some falling off in other bulbous stock. Smilax is scarce.

Trade has been fair, though hardly up to the previous week's business. Shipping trade has fallen off quite materially and funeral work has been in less demand than for several months. The weather continues mild and pleasant and Easter stock is coming on in good shape.

Notes.

F. Peteler, formerly clerk for Chris Hansen, has started a store on Robert street in a good location to catch trade. His opening day leader was "Roses, 50 cents per dozen." We understand that he will obtain his stock from Chicago.

Holen & Olsen, on St. Peter street, have a neat, attractive store and are enjoying a very lucrative trade.

J. Holtomt has discontinued his store on Mackubin street and retired from business.

Wm. Scott, propagator for L. L. May & Co., will join the Klondike caravan next week and endeavor to grow or find gold nuggets in the frozen north. X. Y. Z.

ROCHESTER, N. Y.

Prospects for Easter.

Flowers quite plentiful and trade slow, has been the experience the past week; the dullness is relieved to some extent by a more animated demand for flowering plants, which at present are greatly in evidence everywhere. The unusual warm weather brings out a good many of the azaleas too fast with several growers and although we cannot say that there is really an oversupply so far, we may expect such a condition within the next two weeks if the mild sunny weather continues, because many of the plants in some places are advanced too far now to be kept much longer unless a radical change in the temperature comes upon us shortly. Still with all this, we shall have an ample supply of good azaleas in all sizes for Easter week. In two or three establishments we notice that all the plants are just right, barely showing color now and quite a number are kept in reserve even for a still later date. With kalmias and rhododendrons no such difficulties are experienced, they are easily kept dormant and can be brought forward quickly at this time of the year. Metrosideros are often a little slow in coming out, but conditions were very favorable this season. They do not show color yet but the buds are fully developed, ready to burst open. The genistas did not require any forcing at all so far and it is not very likely that they will need any. Some of the lilies in town are so forward that they would require the temperature of a cold storage room to keep until Easter. Other batches are late and want the brightest sun and lots of heat to bring them out in time. All other flowering stock will be very abundant apparently, everybody being prepared for a big demand in this line.

In Highland park, among the highly interesting collection of rare trees and shrubs, the Japan witchhazel (Hamamelis arborea, I believe) has been in full bloom for two weeks now and is quite showy with its clear yellow long, narrow, thread-like petals, springing from the coppery-bronze colored calyces, which are produced in little clusters, three to six in a bunch, from the eyes all along last season's growth. The flowers are far superior to our well known native H. virginica, which blooms in November or December, have a distinct and pleasing fragrance and being such a very early bloomer attracts universal attention, which it fully deserves.

A Visit to Syracuse.

A delegation of Rochester florists is visiting (?) in Syracuse to day (Monday). They are expected by their friends in the Salt city and are sure of a very hearty welcome. K.

HUNT'S REVIEW OF THE CHICAGO MARKET.

A fairly active week. Last part of last week was particularly good. There have been times each day when trade seemed dead, but revival has always been prompt.

Last days of the old week saw carnations galore, but Monday found a decided scarcity. No particular famine, but not quite enough for the demand.

Prices have been moderate in all things and stocks have moved freely in consequence.

Violets seem on the average to be deteriorating in quality, while quantities offered have shrunk somewhat. Some few, as contraries go, are better than ever.

Quite a falling off in bulbous stocks—still enough for all purposes. Callas have been a drug, while smilax has been exceedingly scarce—at times positively none to be had—the best selling at highest price reached since last Easter, 15 cents.

The visible supply of common ferns is small and the supply at hand on this market correspondingly short, at times next to none in town; a further advance is not unlikely.

Phoenix Nursery.

5,000 Bush Honeysuckle, 2 to 5 feet.
10,000 Rose Stocks, Native seedlings.
3,000 Yucca Seedlings, Dwarf Almonds.
5,000 Street size Norway and Sugar Maple, Elm, Linden, Box Elder, Catalpa, etc. Also Fruit Trees, Small Fruits. Price List free.

WE HAVE PLEASURE IN OFFERING TO THE TRADE THIS SEASON FOR THE FIRST TIME ONE OF

The Finest Novelties in Chrysanthemums

——EVER SENT OUT——

...MRS. O. P. BASSETT...

It will only be necessary for us to state that **This is a Yellow Mrs. Henry Robinson**

to ensure for it a large sale. It is a sport from Mrs. Henry Robinson, with which variety it is identical in every respect except color, being a delicate primrose yellow, deepening toward the center of the flower. It has been thoroughly tested, and is a novelty of sterling merit. One of the most eminent eastern growers who has tested it states that it is one of the best things in Chrysanthemums sent out in some time. Every Chrysanthemum grower will want it. **A Yellow Mrs. Henry Robinson** will be a money-maker, and a fine exhibition variety as well. Plants now ready for delivery. We have also fine stocks of the other finer introductions of the year—**FRANK HARDY, MRS. H. WEEKS, AUSTRALIAN GOLD.**

[Price, $3.00 per dozen; $20.00 per 100.]

Wm. H. Chadwick, $6 per doz. The Yellow Fellow, $3 per doz. Pennsylvania, Autumn Glory, Solar Queen, Black Hawk, Quito, Thornden, $5 per doz.; $35 per 100. Boundless Snow, Mrs. C. H. Peirce, Miss Gladys Vanderbilt, $3.50 per doz.; $25 per 100.

We offer also all the best of the **Novelties for 1897,** and the **Best Standard Sorts.** Send for our wholesale list and large descriptive catalogue, giving full list of varieties and prices. We have a very large and fine lot of Novelties in Cannas for 1898, also best and latest introductions in Carnations, Dahlias, Strong Field-grown Roses and other Hardy Plants, a large and fine collection of Palms and other Decorative Plants, etc., etc.

We will be pleased to send our wholesale list and descriptive catalogue to any one who may not have received them.

PITTSBURG.

The agreeable weather of the past week has aided business to some extent. Stock is plentiful, but no surplus is noticed. At the last meeting of the Florists' Club it was decided to make our next meeting, March 24, a "Carnation Night." Every grower and dealer is requested to exhibit samples of his carnations. Those having carnations to display for this exhibit can send them to P. & A. F. & G. Club, T. P. Langhans, Sec'y, Allegheny, Pa., who will attend to their proper display.

At a recent visit to the greenhouse of Mr. John Bader, Mount Troy, Allegheny, Pa., your correspondent saw several houses of Azalea Indica which will be in fine shape for Easter. Mr. Bader has made extensive preparations to supply the trade with blooming plants, palms, etc., for the Easter season.

At the last meeting of the Botanical Society of Western Pennsylvania, the subject of "Botany in the Schoolroom a Natural Factor in Development," was discussed by Anna M. Deens, of the Pittsburg High School.

Visitors: Messrs. L. Van Leeuwen, Bulbgrower, Sassenheim; H. Weber, of H. Weber & Sons, Oakland, Md. The latter showed very fine blooms of their new rose Mrs. Robert Garrett.

L.

BUSINESS CHANGE.

W. T. Bell, of Franklin, Pa., who has been engaged in business as a florist there for thirty years, has taken two of his sons, John Bell and Philip Bell into partnership, and the firm will be known as W. T. Bell & Sons. The sons have always been engaged with the father, and have been practical florists from childhood. Two large houses will be added, and extensive improvements made this season.

SIMMONS'

New Light Colored # CARNATION

Mrs. S. A. Northway

We introduce this variety with even more confidence than we did Portia, Silver Spray, Tidal Wave, Daybreak, Rose Queen, or J. J. Harrison, knowing that it will become as great a cut flower variety as any of the above. Plant of strong, free growing habit, entirely free from disease or rust; large round high built flower with perfect calyx and extra strong and long stem. Color a beautiful soft shell pink becoming almost white when fully open.

Orders booked now and filled in rotation. We shall commence to ship soon after Jan'y 1st. Price, $10.00 per 100; $75.00 per 1000.

Geraniums. Md. Bruant, Md. Jaulen, Fleure Poitevine, J. Ricaud, and J. Sallier, 2¼-in. pot plants, $5.00 per 100. Rooted cuttings, $3.00 per 100; $25.00 per 1000. Our superb stock of all the finest sorts, 2¼-in. pot plants, named, $25.00; unnamed, $20.00 per 1000. Rooted cuttings, $12.50 per 1000.

Fuchsias. A grand lot of summered-over stock in small pots that will make early bloomers, $3.00 per 100.

All Rooted Cuttings Cash with Order.
Our Price List describes many other fine plants. Send for it.

W. P. SIMMONS & CO., - Geneva, Ohio.

Two Great Sports.

Carnation Victor.

Undoubtedly the best Pink Carnation in commerce and certainly the most prolific bloomer, perfectly healthy and of vigorous growth.

Rooted cuttings now ready, $4.00 per 100; $35.00 per 1000. Come and see this Carnation growing.

Chrysanthemum Pennsylvania.

The finest yellow for cut blooms or exhibition purposes ever produced. Plants ready March 15, $5.00 per doz.; $35.00 per 100; $250.00 per 1000.

Use Economy and Make Your Own Pots

THE COW MANURE POT is the best in the world for young plants. For bedding and sending of plants it is the best thing ever invented. The cow manure forces the plant and makes it healthier. You do not need to disturb the roots in getting them out as you do in the clay pots. It is especially recommended for the sending of plants, as the plant does not have to be taken out of pot. For bedding all you have to do is to squeeze the bottom of pot and set out in bed. It never stays the plant, it holds the moisture better, especially if you have a dry summer. The pots stand watering in greenhouse and hotbed. Every gardener needs one of these machines. **Single machine, 2-in. pots, $4.50. Double machine, 2 and 3-in. pots, $5.**

Machine weighs about 5 pounds.

BALTIMORE.

Resume of Business.

Much to the surprise and delight of all concerned, flowers so far this season have escaped the usual Lenten denial list, and are as much in demand as ever. Small social affairs, which are seldom counted upon, have been very numerous, and entertaining in general has received little material check since the religious season began.

The time has now arrived that the florist cannot afford to allow even the smallest holiday or anniversary to pass by unnoticed. The public is learning to look for a change of window and a display appropriate to the occasion. St. Patrick's day, which is our next date of importance, will be celebrated by the Baltimoreans on the 17th inst. On that feast the retailers have quite a demand for shamrock, of which this season very little is to be seen. Judging from the scarce supply, one would think our growers were all Frenchmen. Any one, however, will tell you differently.

Stock—Prices.

The excessive warm spell which we have experienced the past week has produced stuff in abundance, and if this unseasonable weather continues there will be a regular glut.

The supply of violets far exceeds an unusually good demand. Several retailers are now selling at 75 cents per hundred. Last Thursday was "bargain day" for a Lexington street florist, when the price was 50 cents.

Mr. Samuel S. Pennock, of Philadelphia, was again in town for a few days. C. F. F.

SALT LAKE CITY, UTAH.—The Utah Florists' and Gardeners' Association has been organized with officers as follows: John Reading, Pres.; John Starley, Vice-Pres.; Hugh Connor, Rec. Sec'y; E. J. Petty, Treas.; Peter Huddart, Cor. Sec'y. At the second meeting of the association on March 14 the program included a paper on "Camellias, Azaleas and Rhododendrons," by W. A. Schultheis; one on "Vegetable growing under glass," by John C. Swaner; and on "Roses and Carnations," by Thomas Hobday.

MINNEAPOLIS, MINN.—On March 1 the "Soo," Northern Pacific and Great Northern railways put into effect one-half rates on grass and clover seed to points on their lines in Minnesota and North Dakota.

The New Carnation, Cerise Queen

READ WHAT THOSE THAT ARE GROWING IT HAVE TO SAY:

Mount Greenwood, Ill.
MR. FRED BREITMEYER,
Mt. Clemens, Mich.,

Dear Sir:—In reply to yours for our experience of Cerise Queen, will say that under our treatment the color, form and substance is all that can be desired; we have also found it a very free and continuous bloomer and have never found a bursted calyx the whole season; it is a little weak in the stem, but we lay that to the poor place in which it is growing, also we think one should be careful and not overfeed it, as it does not need it, but produces a fine flower under ordinary care.
Yours truly, C. W. JOHNSON.

H. DALE, Cut Flower Grower,
Brampton, Ontario.
MESSRS. J. BREITMEYER & SONS,
Mt. Clemens, Mich.,

Gents:—The plants of Cerise Queen which you sent me last spring for trial have done well; the flower is of very pleasing color, stem medium length, 15 to 18 inches; habit of plant good. I shall plant it again next year.
Yours truly, H. DALE.

DAILLEDOUZE BROS.,
Flatbush, Brooklyn, N. Y.
JOHN BREITMEYER & SONS,
Mt. Clemens, Mich.,

Gents:—We have a few plants of your No. 16, Cerise Queen, on trial; the flower is medium size, but fine color, in fact the only fault we find is its dwarf habit; we should like to grow some for side benches, as we believe it far superior to Tidal Wave for that purpose, and should make a commercial variety, but not high priced. Please give us your best price on 1000 rooted cuttings.
Very truly yours,
DAILLEDOUZE BROS.

GEO. A. RACKHAM, Wholesale Grower,
Detroit, Mich.
J. BREITMEYER & SONS,
Mt. Clemens, Mich.,

Dear Sirs:—In reply to yours asking as to my success with your No. 16, Cerise Queen, will say that I consider it the ideal Carnation of its type, very productive, continuous, stiff stem, of medium length, and holds its color longer on the plant than any Tidal Wave ever grown. I shall plant a house of it, if I am able to procure the stock.
Yours, GEO. A. RACKHAM.

Copy of a Letter---My order for 1000 cuttings, which is a big one for my small place, speaks louder than words. W. N. RUDD.

We predict **CERISE QUEEN** is the coming Dark Pink Commercial Carnation.
Orders booked and filled in rotation. Price. $2 per doz.: $10 per 100; $75 per 1000.

NEW PELARGONIUMS.

The following new Pelargoniums of very recent introduction, will bring this class of plants to the front with a big jump. True florist or market type; compact habit, large and attractive flowers, easy growers, free bloomers. **Dorothy, Countess, Tommy Dodd, Champion, H. M. Stanley, Marie Mallet**, strong plants, 2½-in. pots, ready for 4-in., $2 per doz.; $10 per 100. 50 at 100 rate. Cash with order.
ROBERT SANDIFORD, Mansfield, Ohio.

OMAHA, NEB.

Trade keeps up well and it seems that Lent has but little effect on business. Stock is good and plentiful with prices steady. Easter lilies do not look so well as in previous years. The disease seems to be increasing every year. Peterson Bros. has the only stock which is not suffering from the disease.

Henry Peterson, of Florence, Neb., has some California violets which are unusually fine; no better were ever sent to this market.

The Trans-Mississippi exposition buildings are nearly completed. Mr. Ulrich, the landscape gardener of New York, has arrived to beautify the grounds. The weather is very favorable and the indications are that everything will be in fine shape by June first, the opening day.

At their last meeting the florists decided to give a ball before the end of the season.

J. J. H.

SPRINGFIELD, MASS.

Business has been quite brisk of late, and white roses and carnations have been rather scarce. The standard retail price of carnations here is 35 cents a dozen for the common varieties and 50 cents a dozen for the new ones. Among the new ones Conch Shell stands very high. It is a delicate light pink in color, built high in the center, fringed and very fragrant.

Charles R. Miller had the decorations for the assembly ball Feb. 22. Palms, southern smilax and bulbous flowers were largely used. Mr. Miller has a large stock of azaleas in bud and bloom.

The window decorations of Aitkin & Son are worthy of special note. They are exceedingly attractive.

W. F. Gale, now our city forester, is busy working on insect destroyers. His florist business will be continued under the supervision of one of his assistants. H. G.

A LETTER FROM WM. SCOTT REGARDING
GENESEE CARNATION

BUFFALO, February 8, 1898.

DAN'L B. LONG,

DEAR SIR:--You ask for my present impression of carnation Genesee, of which I am growing a bench of 1,200 plants.

Its habit of growth under glass is perfect and needing little support.

In size, purity of color, form and good stem, it leaves little to be desired. A random selected bunch of 25 flowers, picked on the 5th inst. for my retail trade, just as they grew, without any sorting, showed stems averaging 16 inches long, and blooms averaging 2¼ inches diameter. A very valuable feature is that in a hundred flowers there is scarcely one to discard as not up to standard.

Both last year and the present winter, it far outsells any white we have yet handled.

The most sincere result of my impressions is that next winter I shall grow it exclusively, for in my opinion its many and assured good qualities make it a commercial white superior to any that I have yet tried.

I am convinced that this fine white could be lifted with buds well advanced, thus ensuring flowers early in October.

My soil is a dark, sandy loam. One quart of bone flower to one barrow load of soil was used, but no animal manure. Yours very truly, WM. SCOTT.

When writing advertisers mention Florists' Review.

MADISON, N. J.

Morris Co. Florists and Gardeners held the usual monthly meeting on Wednesday last, President Dickham in the chair. It was our first visit since the new president's installation and he evidently means business, as evinced by that calm, persuasive, but all the same forceful ruling by which he brought discursive talkers back to the point of the motion. Co-operative purchasing of supplies was fully discussed and matters advanced in that direction by the appointing of a sub-committee to ascertain the lines of goods required, the number of members who favored the scheme and an approximate estimate of quantities.

Monthly exhibits at the meetings were talked about and it was decided to make them a feature, but instead of judging all exhibits on one scale of points, an idea suggested by Mr. J. Robertson found most favor, namely to have rose, carnation, herbaceous and wild flower classes, also for fruits and vegetables, the members to select any class they could compete in, and as far as competition was concerned to confine their efforts to the class entered for the entire season. Awards to be made to the most successful in the respective classes, at the end of the year. H.

A HANDSOME CATALOGUE.

"Choice selections in seeds and plants," is the title of the 1898 catalogue of F. R. Pierson Co., Tarrytown-on-Hudson, N. Y., of which we have received a copy. The lists of greenhouse and hardy ornamental plants, bulbs, seeds, tools, etc., are very full and complete, and are freely illustrated by many handsome, original half-tone engravings of more than usual merit. It is a catalogue that inspires confidence and respect and is a fit representative of the well known firm that issues it.

SINGLE TUBEROUS BEGONIAS

DREER'S Special Offer of...

SEASONABLE Bulbs and Tubers

Tuberous-Rooted Begonias and Gloxinias. Now is the time to plant for early flowering. Our strain this season is even superior to that supplied by us in the past, having secured control of the stock of two of the most successful European growers, same having been personally inspected by us while in flower, **and which must not be confounded with cheap strains.**

SINGLE TUBEROUS-ROOTED BEGONIAS.

Separate Colors—Crimson, Scarlet, White, Rose, Yellow and Orange.
50c. per doz.; $3.00 per 100; $25.00 per 1000.
Choicest Single Varieties in Mixture—40c. per doz.; $2.50 per 100; $20.00 per 1000.

DOUBLE TUBEROUS-ROOTED BEGONIAS.

Separate Colors—Scarlet, Rose, White and Yellow.
$1.25 per doz.; $10.00 per 100; $90.00 per 1000.
Choicest Double Mixed—$1.00 per doz.; $8.00 per 100; $70.00 per 1000.

GLOXINIAS.

A Superb Strain in Choicest Mixture—75c. per doz.; $5.00 per 100; $40.00 per 1000.

FANCY LEAVED CALADIUMS.

Choice Named Varieties, in 25 sorts—$2.00 per doz.; $15.00 per 100.
Choice Mixed Varieties—$1.00 per doz.; $8.00 per 100.

DAHLIAS.

A fine assortment of 25 Double Cactus, 12 Double Show and Fancy, 20 Pompon, strong field-grown roots, $1.00 per doz.; $5.00 per 100.

MONTBRETIAS.

One of the most desirable of our Summer and Fall flowering bulbs, comparatively but little known, but certain to become popular. Six choice named sorts, 35c. per doz.; $2.50 per 100.

TUBEROSES.

True Dwarf Double Pearl, selected 4 to 6-in. bulbs, 35c. per 100; $7.50 per 1000.

JAPANESE LILIES.

Send for List of Sorts and Prices.

817 Fairmount Ave., Philadelphia, Pa.

AN UNPARALLELED SUBSCRIPTION OFFER.

EVERY one to whom this issue of the FLORISTS' REVIEW is addressed, and who fills out, signs and returns the accompanying subscription blank, accompanied by $1.00, within 30 days from date, will receive not only the FLORISTS' REVIEW for one year but also a certificate entitling him to the earnings on one-tenth of a share of stock in the company formed to publish the paper. The shares will be of a par value of $10.00 each.

Why do we make such an unparalleled offer? It is very simple.

You will have an interest in the success of the paper.

You will see that you can buy everything that you want to just as good advantage from advertisers in the FLORISTS' REVIEW as elsewhere and at the same time benefit yourself by increasing the earning power of your certificate.

This mutual arrangement cannot fail to bring to the paper a heavy advertising patronage, and as a result the stock represented by your certificate will earn good dividends.

And the more you buy of advertisers in the FLORISTS' REVIEW (always mentioning the paper) the larger your dividends will be.

You will get a better paper than has yet been published in this field, and a share of its earnings. Please let us hear from you by early mail.

THE WEEKLY

FLORISTS' REVIEW

COPYRIGHT, 1898, BY
FLORISTS' PUBLISHING CO., 520-535 Caxton Building, CHICAGO.

Vol. 1. CHICAGO AND NEW YORK, MARCH 24, 1898. No. 17.

THE SWEET BAY.

The Sweet Bay (Laurus nobilis) has been imported from Belgium to this country in large numbers the past 15 or 20 years. Although the rather stiff, formal shapes into which they are trimmed and to which they so readily conform are entirely inappropriate in the decoration of a drawing room, yet there are many situations where they have a striking effect and are certainly not out of place. A single pair of perfect form could be admitted to any church ceremony or at the decorating of a large hall. In the summer time a handsome pair stand—one on each side of the broad granolithic walk, leading to a stately mansion on one of our fine residence streets, and very fine their appearance is. Too much of it may get tiresome as clipped and grotesquely-shaped Norway spruces do if overdone, but the chronic grumbler who in his ignorant and prejudiced blindness objects to these handsome Bay trees because "they are not natural" should wade through water and live on porridge the balance of his days. Their formality sets off the brighter the natural grace of the birch, the elm, the maple or Linden and the more or less freedom of the hardy flowering shrubs.

Another place I found the Bays to be useful was when asked to decorate for a store opening and wagon loads of palms are expected. They are just the thing to fill up and a fine pair or half a dozen of them on the sidewalk is just what Mr. Goldstein wants to attract the attention of every passer by, and what could you put there equal in appearance and withstand the ordeal unharmed? Considering the years they must be grown, the labor entailed and great skill in producing such a large tree in such a comparatively small tub, their cost to us is, I think, very moderate.

It is often a surprise to us that such

a stout stem and large head of branches and leaves can subsist on relatively so small a quantity of soil. From early spring till fall they want an abundance of water. They are out of doors all summer, or should be, so the hose should play on their heads freely and over watering of the soil is about impossible from November to April. A cold shed will keep them in good order if it is not too dark and where they won't get more than 10 degrees of frost. Some let them get dry but less water will do than in the summer time.

The Sweet Bay is a native of Southern Europe. All good boys should have read in the good book that if they are righteous in their lives they will "flourish like the green bay tree." But they must not become a millionaire by keeping a department store or they will be more like an aged pumpkin, hollow, mushy and slushy inwardly. This fine evergreen grows well and is much planted in the milder parts of the British Isles. I expect that all over Ireland it grows finely and is seldom or never injured by frost. In the South of England it grows and flourishes for years, but a winter comes occasionally and kills it to the ground. Such a winter was that of sixty and sixty-one.

The best time for us to cut back growths or to keep it in that splendid form that they are sent to us, is in the spring just before they start to grow, but if you wished a still more trim appearance you would have to pinch the young growths as they develop. A new tub and more root room is needed every three or four years, but keep them in as small a tub as possible. Liquid manure will help them much in April, May and June. To those who have not made bows of their strong bottom growths or hunted rabbits beneath their branches, they may appear a cumbersome plant to occupy valuable greenhouse room. They don't want it. If never coddled up under glass they will stand 15 degrees of frost without harm, but rather give them a little higher temperature.

WM. SCOTT.

A. B. C. NOTES ON CYPRIPEDIUMS.

Our worthy editor made a pertinent suggestion recently, namely that something of the nature of an a, b, c article on cypripediums was desirable as it would better enable those less familiar with this great family of orchids to understand and appreciate such notes as may hereafter appear relating to the newer and rarer varieties. It is a matter of common occurrence now to read of the flowering and christening of some new kind raised by crossing others in cultivation and so numerous have these hybrids become, and so small the distinction of many, that one realizes the force of the remark often made by the casual observer: "All cyps look alike to me." Those here depicted are certainly in some instances strikingly unlike each other and make the above remark appear somewhat absurd, but there is much truth in it notwithstanding, owing to the too common practice of naming everything of hybrid origin, and manufacturing varieties by the dozen, from one cross and in some instances all out of one seedpod.

It is no great tax upon the memory to recall the period when the very possibilities of cross breeding among orchids were thought impossible, but the artifices of man overcame the obstacles of nature, with such success that now in this cypripedium family alone the varieties outnumber the original species by more than ten to one. The need for a, b, c notes therefore becomes apparent when there are more than one thousand recorded names of cypripediums and yet not one hundred of them have specific rank or exist in a state of nature.

The interest in orchids is annually increasing, both commercially and privately, but the chaotic state of affairs in the cyp. family is sufficient to strike dismay into the heart of anyone who would take it up at the present day and get an intelligent understanding of the different relationships in this vast assemblage. Even those familiar with past history and concurrent developments are asking "where we are" and "whither are we going." The only light that will effectually illumine the past and guide the grower of today still shines and is exemplified by the types and species that, in part, are here portrayed, showing their widely varying natural characteristics. In its natural distribution the cypripedium is cosmopolitan. There are hardy and tender species, to be found in North and South America, from Canada to Peru, in Europe and in Asia from Siberia to New Guinea. Some are terrestrial, that is grow on the ground like ordinary plants, all the hardy species being of this nature, but the majority are epiphytal, growing upon trees in the tropics.

With this much by way of introduction, we will now take a glance at the distinctive features of certain types and the reader who can see and fully grasp the purport of the succeeding remarks should be materially assisted in arriving at a better understanding of cypripediums and see how even the apparently disordered hosts we now have may be marshalled in orderly array to a degree, not absolute, but certainly comparative; as the work of the hybridist has resulted in the commingling of distinctive traits, with a resultant chain of connected links, a perfect sequence of variable intermediate forms that operate to the prevention of drawing hard and fast lines.

Taking first into consideration the American species, I will refer as a type to C. magniflorum in the picture. It is a variety of a Central American species named longiflorum, but you will readily observe in the flower a great likeness to the Mocassin flower, C. spectabile, of our own latitudes, only the latter is larger and more showy. C. Roezli and C. Schlimi are somewhat similar species and the intercrossing of these has originated some fine varieties. C. caudatum will be readily acknowledged a most unique cyp. and comes from Peru. The illustration shows well the character of the flower, those drooping tail like appendages being true petals, which have been known to attain a length of 36 inches, though usually they are not quite as long. John Dominy, the father of orchid hybridists, raised and is commemorated by C. Dominianum, the result of a cross between caudatum and caricium, whilst the impress of its parentage is manifest in other fine hybrids, like grande, Schroederae and Hardyanum.

C. insigne, now so plentiful and popular as a market cut flower, is one of the oldest Asiatic species in cultivation having been introduced from Nepaul early in the present century. Apart from its almost infinite natural variation, which has found expression in the naming of many of the most distinct varieties, it is also one parent of at least a hundred named hybrids in cultivation today. Whilst as I said on a previous occasion, there are those who deplore this mixing up and wholesale manufacture of varieties it is not fair to belittle the work of the hybridist with broad generalizations, ignoring the sterling acquisitions their work has secured to us. "Look before you leap," is a sound maxium, but some of our best acquisitions in cyps. partake more of the character of a leap in the dark, yet have turned out to be of far reaching importance. For example, when C. insigne was first crossed with C. Spicerianum, of which C.

Some Types of Cypripediums.

Hebe in the picture is fairly typical, no one foresaw or ventured to prophesy that this was the initial movement in the founding of a large and distinct group as beautiful as any in the whole cyp. family, yet all cyp. lovers will agree to the placing of C. Leeanum and its varieties in the first rank for beauty. C. insigne needs no description.

C. Spicerianum has a dorsal sepal almost entirely pure white. This characteristic is transmitted to all of its progeny in slightly varying degree, as showing marked likeness to this one of their parents. They will continue rare, too, as the natural habitat of Fairieanum is unknown and though large sums of money have been offered no collector has yet earned the reward by bringing home a batch of plants. Here is still a real golden opportunity, for the man that can find its home and get plants to Europe in live condition will strike a real paying "Klondike" that will "pan out" in hard cash.

C. Rothschildianum is well represented in the picture and a glance at its peculiar form and spidery petals will enable readers to understand the interest aroused a short time ago when a question of Rothschildianum hybrids arose. It is obvious that a flower so striking would transmit distinctive traits to its progeny, as indeed it has to such hybrids from it as have been flowered. It is a native of New Guinea and was introduced to cultivation by Sander & Co., of St. Albans, England, in 1887.

C. Curtisi, a species from Sumatra and here illustrated, has a bold and beautiful flower. It is one of the parents of two very fine American hybrids, as crossed with argus it gave Hurrellianum, and with Philippinense, Clinkaberryanum, besides which there are at least two dozen other cyps that claim it as one of their parents.

C. hirsutissimum is a beautiful species from Assam that has broad distinctions peculiar to itself and as plainly stamped upon any of its progeny, of which Alcides and Eurylochus, both described in The Review of Dec. 30, and Germinyanum, form a select trio, with about a score of others in existence hardly less beautiful.

C. tonso-villosum stands out as a prominent looking flower in the picture and is as bold as it looks. It is a hybrid of the two species that form its name, but with the villosum features so predominating that it was selected to typify that family. C. villosum is a beautiful, easily grown free flowering cyp coming from Burmah, is a parent of about three dozen fine hybrids, one of them, Pygmalion, being described in the issue of Dec. 30, whilst Harrisianum, nitens, luridum and Lathamianum all show its potency in the origination of lovely forms.

C. pavoninum is a hybrid representing C. venustum, this being an old species long in cultivation, easily grown, in a cool house and one that has filled a large part in the origination of hybrids.

Last, and least in size, but far from least in relative importance, comes the pretty little C. niveum in the left bottom corner of the picture. It represents the opposite extreme of C. caudatum, having a dainty close bui t flower with all its parts overlapping each other, the flowers of snowy whiteness except for a few irregularly scattered dots of color about the base of its petals and sepals. It was introduced from the Malay archipelago about 20 years ago. Together with C. bellatulum and C. concolor and their numerous most beautiful hybrids, they form a race of their own, of exceeding beauty, but they are mostly rare and require careful treatment. It is necessary to graduate in the school of ordinary cyps before one essays the cultivation of these precious gems.

A. HERRINGTON.

Madison, N. J.

View in Cattleya Trianae House at Lager & Hurrell's.

ORCHIDS FOR PROFIT.

"Does it pay to grow orchids for cut flowers?"

"Certainly it does if they are handled properly and the right kinds are grown."

Above is my first question and the reply to same by Messrs. Lager & Hurrell during a recent visit to their establishment. Though at Summit (N. J.) they commenced at the bottom of the ladder, and being exclusively orchid growers and importers I concluded they would be the right people to settle some often discussed and knotty problems as regards orchids for profit. What the florist is most interested in is whether the orchids that find ready sale can be produced at a figure that will leave a good margin of profit.

"What are the right varieties?" I asked.

"Following is a list of the best kinds for cut flowers and those marked with a * are especially desirable: *Cattleya Trianae, *C. labiata, C. Mossiae, C. Mendelli, C. Chocoensis, *C. Gigas, C.

Mass of Cattleya Trianae, grown on wooden block.

Percivalliana, Laelia anceps, *Cypripedium insigne, cypripediums in variety, *Dendrobium Phalaenopsis, *D. formosum giganteum, *D. Wardianum, *D. nobile, *Vanda caerulea, *Oncidium varicosum Rogersii, *O. splendidum, *Oncidium tigrinum, *Phalaenopsis Schilleriana, *P. amabilis, *Cymbidium Mastersii, *C. eburneum, *Odontoglossum crispum, O. Roezlii, O. grande, *Calanthe Veitchii, C. vestita rubro-occulata, Miltonia vexillarium, Coelogyne cristata."

"Does it require a special house to grow these kinds?"

"Emphatically no."

"What orchids will do well in a carnation house in the winter?"

"Cypripediums, coelogynes, cymbidiums, Miltonia vexillarium and Laelia anceps."

"What orchids will do well in a palm house during winter?"

"Cattleyas, dendrobiums, oncidiums, calanthes, phalaenopsis."

"What houses do they require in the summer?"

"Any house that is fairly shaded. Those mentioned for the carnation house will do well in frames, or even out of doors if supplied with shade."

"Which varieties do you consider the most difficult to grow?"

"Odontoglossum crispum and phalaenopsis, the former requiring the lowest and the latter the highest temperature."

"How do you grow your cattleyas?"

"Chiefly on boards and in baskets. We have dispensed with pots entirely."

"What are the advantages of boards?"

"Cheapness, simplicity, ease in handling and shipping, and the greater thriftiness of the plants, the latter due to the large surface for root action and approaching nature more closely than any other artificial means. The results are larger bulbs (even beating the natural growth in the woods) and superior flowers. We find the board system the best in every way."

"What size boards do you use?"

"Hemlock, 5x10 feet and smaller, with ordinary lath attached to the sides."

"How do you attach your plants?"

"By non-corrosive wire staples, placing a small piece of peat between them and the rhizomes of the plants."

"How do you arrange your boards?"

"In the middle bench at an angle of about 30 degrees, and about three feet from the glass. They can also be placed on side benches, or be hung up on the sides of houses."

"Do you advocate this for other species?"

"Yes, for laelias, dendrobiums, Oncidiums, odontoglossums, miltonias and coelogynes. For others baskets and small blocks are preferable."

"Do you feed your plants?"

"Yes, decidedly. Our baskets and blocks we dip in a tub of liquid natural sheep manure, and for our boards, in the growing season, we make a compost composed of three-fourths moss and chopped peat and one-fourth natural sheep manure."

"What are the results?"

"Better flowers, better bulbs and better plants. The system we have worked under has so far exceeded our most sanguine expectations."

"What do you consider the right temperature for cattleyas?"

"In winter 55 degrees at night with a rise of 10 degrees for the day. The summer heat can not be controlled so the outside temperature usually governs. Plenty of air should be given on every favorable occasion, both day and night, and in winter when the sun is strong enough to allow it. A slight shading should, however, be used to break the rays of the sun at all times."

"Is not watering a very great factor in orchid growing?"

"Not more so than with other plants. Too much coddling has been practised in this direction. We water our plants overhead and leaves and growths are alike wet in the process. It helps to keep down vermin and scale, and our plants have not so far suffered any ill effects. Of course watering shou'd be done early in the day to give the plants a chance to dry off. In the resting season, that is before and after

Freshly imported Cattleya Gigas, direct from the woods.

blooming, water should be given sparingly."

"How many blooms will one of these boards produce in a season?"

"An average of 40 to 50." (See illustration.)

"What is your average price for cattleya flowers?"

"Thirty-five cents each."

"Does this result satisfy you?"

"Yes."

"Do you grow any other species in quantity?"

"No, but we expect to and are now having plans made for a new house, 20x150."

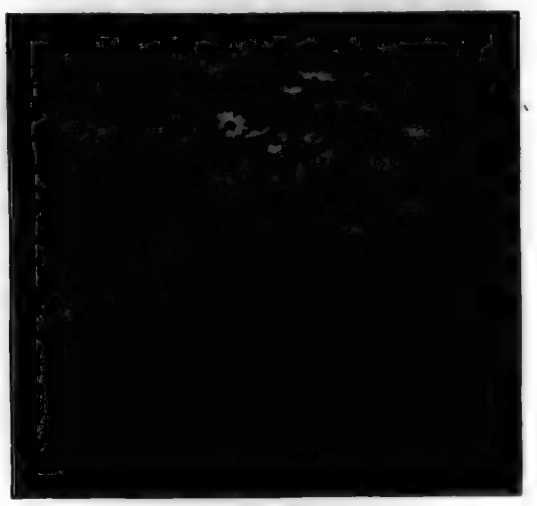
"Do you think that orchid plants are getting scarcer in their native habitats?"

"Most decidedly. In collecting it is necessary to go much farther into the interior and large sections have been depopulated. And as the supply shortens the price must advance."

"What is the best time to import orchids, more especially cattleyas?"

"Any time. It makes no difference whatever, providing proper care is taken in packing according to the season."

"Would you be willing to answer any other questions about orchids and orchid culture through The Review?"



"Yes, with pleasure, for orchids are becoming more popular every day and we would like to refute some of the 'Bogie' stories that have taken root, and to dispel some of the mistaken ideas about orchids."

AGATHEA COELESTIS.

For years this deserving plant had not been mentioned in any of our florists' papers until early in January, when a short notice on a few trial plants grown for Christmas blooming appeared in The Review. Since then a number of articles on the cultivation and the uses of this plant have appeared in other papers, showing evidently that some of our florists at least appreciate the value of old things as well as of the newer introductions, and that I was not the only one experimenting in this line to possibly add more variety to the limited stock of flowering plants for Christmas sales.

There is no doubt that the agathea can be grown into large specimen plants, as intimated in one of the articles referred to, but in our northern climate we may never succeed in accomplishing it all in one year. Starting from a cutting, one year old plants will not be much over 10 inches or a foot high at the end of a season, even when planted out in the most favorable position and with the very best of care. Those plants 3 to 4 feet high and as much across, which we see in southern countries, are no chickens; they have been treated to repeated annual shearings and if we should try to grow such specimens here, I am afraid the grower would get discouraged with the size of his plants at the end of the third year. However, we will be able to grow handsome strong plants 12 to 18 inches high in two years, but then they should be planted out in the open ground and receive a liberal amount of attention. Their growth naturally is inclined to be short and compact, but occasionally a few straggling shoots may have to be shortened in order to keep the plant in shape.

In the fall we must pot them and if not wanted for blooming that same winter, a protected frame will be good enough to store them away in; they are almost hardy and can stand a few degrees of frost, in fact some years they come through in open border when slightly protected, but are not to be depended on as perfectly hardy. When planted out again the second year, the growth is stronger and quicker than in the first season. I would recommend to pot them up early in September and to keep the plants well syringed until the roots are again active and able to nourish and support all the foliage. With early potted plants no trouble should be experienced to get them to bloom freely by the middle of December and thereafter. Whether it will be a paying investment to grow these larger plants or whether we would do better to dispose of them the first season, remains to be demonstrated by somebody. I would prefer to sell one year old medium sized plants, but in larger cities there is a market for good sized specimen plants and often the price is not objected to if the stock is of the right sort. If we had the advantage of a mild southern climate (the same as that where your correspondent first

Agathea Coelestis.

cultivated these plants many years ago), our plants would grow continuously summer and winter and we could produce any desired size with very little expense, but when we have to winter the stock under glass, be it

even without heat, the labor and all et ceteras have to be considered, and the plants in the end may prove rather expensive to the grower.

The accompanying cut represents a little plant in a 5-inch pot, last spring's cutting; was grown altogether in a pot and received no extra treatment, in fact the little batch of plants was really neglected until towards the fall months, else the plants might have been larger. The photograph was taken shortly after New Year's, when only a few of the poorest specimens, sparsely flowered, were left, still even these have found purchasers since that time. K.

NERINES.

In those we have a singularly beautiful genus of greenhouse bulbous plants, the handsome flowers of which are produced in umbels on the top of erect stems about 18 inches long, which greatly enhances their value for decorative purposes. No flower that I am acquainted with shows up to greater advantage under artificial light than the subject of this illustration, the color of which is a beautiful harmony of very intense scarlet and yellow, which under strong light has the appearance of having been frosted over; in fact, all the varieties of this genus have the same characteristic to a greater or less degree.

They are very free flowering, but many growers have a difficulty in flowering them satisfactorily. To be successful with them the principal cultural details are to give due attention to the full development of the bulbs. The nerine will indicate its intentions of starting into growth by pushing up the flower spike when the bulb is totally devoid of foliage. This will occur in September or October, and the leaves will soon follow, so the plant will continue to grow throughout the winter, when they should have all the light and air possible to the exclusion of frost. They enjoy abundance of water at the root and overhead, with occasional applications of liquid manure, which should be continued right along until the plants show signs of finishing their growth by the leaves turning yellow. Then the water supply may be diminished until they ultimately dry off, when the pots should be laid on their side, where they are not likely to get wet, and let the bulbs have the full benefit of the sun for a few weeks. As the plants have made all their growth during the winter this ripening process is quite essential to insure flowers.

Nerines do not like to have their roots disturbed, nor do they require much rootroom; they grow and flower best when hard potbound. If three bulbs are placed in a 5-inch pot, in good maiden loam with the addition of a little sand, they are good for 5 or 6 years, and even longer, as the offsets can be rubbed off and potted and the parent bulbs go on increasing in size. Each year as the flower spike appears pick about one inch of the surface soil off with a sharp pointed stick, give the ball a good soak in water, and top-dress with a little fresh material.

The species of nerine has a wide distribution. They are found in South Africa, China and Japan, and the species that the trade is most familiar with hails from the Island of Guernsey. The following list are all beautiful kinds, some of which are garden hybrids: N. corusca major, bright scarlet; N. elegans, pink; N. elegans carminata, cerise; N. elegans coerulea, shaded blue; N. Fothergillia, scarlet; N. Fothergillia major, scarlet and yellow; N. humilis splendens, purple crimson; N. Plantii, deep crimson; N. pudica, white; N. sarniensis, "The Guernsey Lily," rose; N. undulata, flesh color; N. venusta, scarlet. J. ROBERTSON.

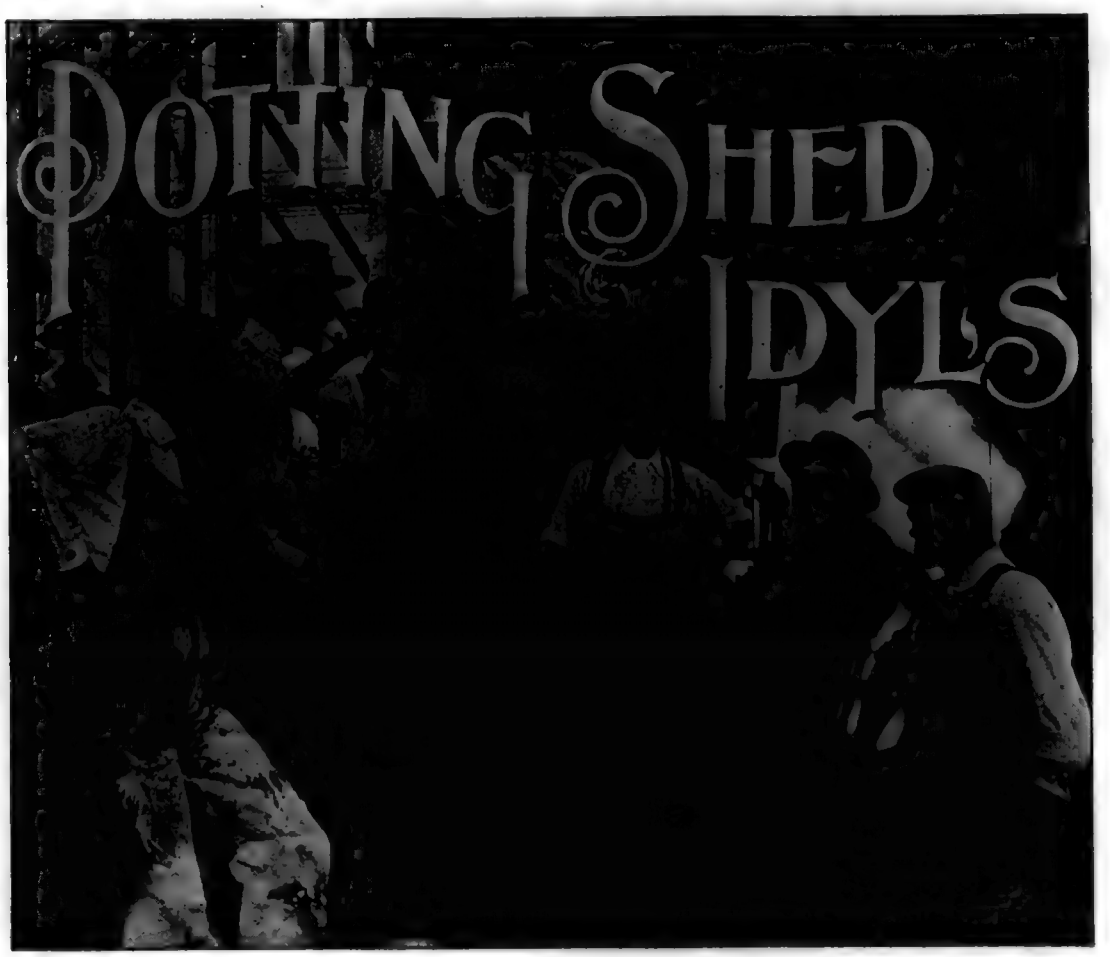
Nerine Fothergillia Major.

SOIL WATER.

The water in the soil contains the substance that, exclusive of carbon, goes to make up the structure of plants. A small portion of the carbon also comes from the soil, but the great bulk of it enters from the atmosphere where the carbon is always present, although in comparatively small quantities in the form of carbon dioxide. In short as the soil water is supplied with food elements so is the plant fed, that is growing upon that soil. It becomes, therefore, every grower of plants to consider the soil water.

First let us look at it in its relation to the soil, and then we will be the better able to discuss its relation to the plants that are drawing upon it for its sustenance. If we take a pot full of soil and add water to it in abundance it will shortly begin to run out of the hole at the bottom of the pot. The soil is saturated and that which is escaping is known as gravitation water and goes down and out, because of its own weight. In other words the soil can hold only a certain amount and all in excess necessarily flows away.

Let us begin the experiment in another way with a second pot of soil. It is dry, as it is termed, and placed in a flower pot and the flower pot is set in a large saucer to which water is added. Every grower knows what happens; the water is absorbed by the soil and after a longer or shorter time it is moist throughout. There is no gravity water present, but there has been much weight added to the pot of soil by water that has risen through the pores of the soil, just as kerosene rises by the same law of capillary attraction up through the wick of the lamp, or the dry towel may become wet by being hung so that only one corner touches the surface of water. This kind of water, taken up and held as moisture in the soil is called, from the law that permits it, capillary water.



But the soil with which we started the last named experiment was not absolutely dry. While it was dry as dust to the hands there was already there a considerable amount of water, but in a condition not to be sensible to the touch. This last is held so closely by the surfaces of the soil particles as not to be affected by either capillarity or gravitation. A method of demonstrating the presence of this third form of water in soil is heat. When dry soil

is heated it loses weight due to this hygroscopic water, as it is termed, being driven off. To be sure it will soon absorb this invisible liquid, but the fact is shown that what seems dry is far from lacking in water.

The amount of the invisible water that gives the soil a moist feel, varies greatly, depending upon the character of the soil. Soils differ much in texture and composition, all the way from pure sand to vegetable mould. The sand is quickly saturated, possibly twenty-five per cent of its weight is all that will be retained without leakage, while upon the other hand a soil abounding in vegetable matter may hold twice its weight of water. The former is leachy, and quickly dries out. The latter is like a sponge and takes up and holds large quantities of liquid.

The addition of a small amount of humus to a sand will double its water holding capacity, while upon the other hand the mixing of sand with a peaty soil will render it more open and less retentive of moisture.

BYRON D. HALSTED.
Rutgers College.

THE PRODIGAL RETURNS.

Life is full of mysteries, and the manner in which Jaggs squared himself with the irate proprietor of the Lonesomehurst greenhouses remains one of them. All that could be learned was that "the old man" returned from New York one afternoon, accompanied by Jaggs, who wore an air of chastened meekness and the Scotch propagator's Sunday coat, the remainder of the suit of "blacks," having apparently journeyed to that bourne from whence Jaggs' overcoats rarely returned. The current opinion was that the boss had insisted that Jaggs should return to adorn Lonesomehurst long enough to work out the money obtained by his operations, being well aware that, so long as he was not paid, the culprit would be hardworking and contented. Jaggs, was a shining example of the deceitfulness of riches. The prodigal did not appear at supper, and the men had been grouped in the pottingshed for some time before he sauntered in, bearing a lop-sided gates-ajar and a couple of wreath frames. Nodding affably to his audience, he remarked: "Better get to work stemmin' alyssum, some o' you chaps. Here's another o' them bloomin' cold meat jobs, and the boss says as we're shy on McGowans."

The western fireman, who was not troubled with shyness, voiced the sentiments of the entire force by remarking: "Say, Jaggs, that was a hot touch you give the old man. How did you square yourself?"

There was no reply to this observation and a somewhat embarrassing pause was broken by a request from Jaggs for the loan of Davie's apron and overalls. "Might as well lend me your dish-habilly, old man, so as I won't soil your Sunday clothes afore I takes 'em off."

"My Sawbath claes!" interjected the indignant Davie. "Ye went awa' wi' a decent suit o' blacks, and see what ye come back in!"

The garments to which Davie pointed with righteous anger were rough tweeds of a subdued mustard color, the pattern being such a vociferous plaid that it awakened the embarrassing suspicion that the wearer might be wandering around in his pajamas. Jaggs patted Davie soothingly on the shoulder, remarking: "You needn't get hot, old chap. The only trouble with them togs o' yours was as they wasn't professional. See a florist goin' around in a black suit, and everybody thinks as he's nothink but a crape chaser. Ain't none o' you chaps got a pipeful o' 'baccy?"

The needed tobacco was not forthcoming until the advent of Tommy Atkins, who had been resting himself after the arduous duties of the day by taking the boss's fox terrier down to the barn for a rat hunt. "Ullo, old chap; 'ow's mermaids?" was his salute as he seated himself on the edge of the bench, and began to trim the brown edges off a dubious calla.

"Don't you get prunin' that there calla too much," advised Jaggs. "Flowers is flowers, this dark weather, and I've only got a pair o' rocky old Harrisii to give style to this here blessed old jail door. There's a nice lot o' Eucharis comin' on, only it 'ud be throwin' pearls before swine to use 'em for any chump as 'ud be guilty of orderin' a gates ajar."

Tommy dropped the calla, and began to stem white azaleas with much dexterity, occasionally humming a line or two of "My Old Dutch" in the liquid accents of Whitechapel. Finally he remarked:

"Well, Jaggs, you ain't told us yet why you chuck up the mermaid business. Is the market weak on flyin' dragons?"

"Dragons is all right, and mermaids is all right," responded Jaggs. "But it ain't a business for a chap as was brought up pious-like; you runs up against such a lot o' doubtful characters. There was one chap as used to supply sturgeon for buildin' mermaids—if you'd heard some o' the fish stories he tell you'd 'a' been shocked—I was myself."

"I should think you would be," observed the horticultural graduate who was now sufficiently educated to stem alyssum without calling forth any sarcastic comments. "You told me once about a place where you worked in Arkansas, and how you baited two miles of barbed wire fence with salt pork, just before the spring freshet, and caught 47 tons of catfish. What did you do with those catfish, by the way?"

"Sold 'em to a firm as makes pure Norwegian cod-liver oil," returned Jaggs, with a joyous wink. "But talkin' about fish, the rummest trip I ever took was in Ceylon, where they goes fishin' with a shot-gun."

"I reckon as I've 'eard o' that," observed Tommy Atkins, with a comprehensive stage wink which took in the entire audience. "That's where hoysters grows on trees, ain't it and the flyin' fish goes flittin' through the branches, along o' the dear little dicky birds?"

"I like to hear Tommy talkin' about the dicky birds, he's so bloomin' po-

Pteris Tremula Smithae.

etic," remarked Jaggs. "Flyin' fish is common enough. I got a lot of 'em when I was in Jamaica, and pasted 'em in a scrap-book as I sent home. What I'm talkin' about is them gobies-fish as goes hoppin' along the beach at low tide, catchin' snails, for all the world like a flock o' ducks waddlin' along huntin' caterpillars."

"What did you call those fish?" asked the graduate.

"Gobies. I first see 'em in the Fiji Islands, that time I came near bein' killed by that there man-eatin' tree, and there was lots o' them around Point de Galle, in Ceylon. Go splashin' around in shallow water, and blessed if them bloomin' fish don't jump out and go hoppin' along the mud to get away. Any chap as talks about a fish out o' water like he mean somethink awkward ain't seen a goby kitin' along lookin' like he belonged in a Christmas pantomime."

"There's only one drawback to your stories, Jaggs," observed the graduate; "you're always so fearfully matter-of-fact. I suppose any exaggerated fish story would be a real exertion to you."

"That's always been a failin' o' mine," returned Jaggs, with much humility. "Well, as I was sayin', a Belgian chap as was collectin' palms (not as he knowed anythink about 'em), asked me to go fishin' with him, and I see as he'd got nothink but a shot-gun. I says, 'Where's your fishin' tackle,' and he says, 'Where's your gun?' I says as I wasn't used to fishin' with a shot-gun, though I have gone duck-huntin' with a fish line, but if it was the custom of the country I was willin' to take a gun, which I did. When we got down to the shore, blessed if there wasn't a whole flock o' them bloomin' fish, hoppin' around after snails. You see their two forward fins is like reg'lar legs, and though I wouldn't call 'em graceful, they gets there just the same. I says to the Belgian, 'Surely, we ain't goin' to stand off and shoot them poor beasts—why not catch 'em in a Christian way?' He say, 'All right, old chap, you just catch 'em, and show me how it's done.' So I picks out my fish, a goggle-eyed fellow as was hoppin' after his dinner, and starts after him. I think as it was dead easy, but Lor' bless you, I wasn't in it one, two, three with that bloomin' fish. He'd just go skimmin' along, and rest on top of a stone, like he was surveyin' the landscape, till I gets near him, then he'd stand up wavin' his paws"—

"'Ow many paws 'as a fish, as a general thing?" inquired Tommy Atkins, innocently.

"I means his fins, o' course," continued Jaggs, severely. "If you seen them fish skippin' along the beach, you'd 'a' though as they had as many legs as a centipede. Well, I give up the race, and then me and the Belgian took pot shots at a covey of 'em, and bagged a dozen or so. But I can't say as it seemed sportsmanlike — give me a game fish as rises to a fly. Still, it ain't any worse than goin' fishin' with a shovel, like they do around Sierra Leone."

"I guess you're thinking about clams," remarked the graduate, with some scorn.

"Now, Johnny, why don't you take a lesson from them domestic animals," observed Jaggs, reproachfully. "A clam don't talk about things as he isn't acquainted with. As I was sayin,' the rivers in the outlyin' districts about Sierra Leone dries up occasionally—like Johnny, here—and the fishes burrows down into the mud and stays there. So, when a chap has a fancy for a fish dinner, he just gets his spade, trots down to the river, and digs up a mess o' fish, like he was gettin' up a bushel of potatoes. I sends a batch o' them fish home, along of some new orchids, and they was that pleased at the Royal Aquarium as nothink was too good for me. Just packed 'em up in lumps o' clay, and the bloomin' fish thought as they was in the river bed. Still, those fish ain't any greener than the climbin' perch. Ever heard o' them, any o' you chaps?"

"What do they climb—apple trees?" inquired the fireman, sarcastically.

"First time I see 'em," continued Jaggs, without noticing the interruption, "I was reachin' for an Angraecum as I see on a big tree, when I touch somethink cold and clammy, and my hair stands right up, for I thinks it's a snake. The thing gives a squeak, and scuttles along the branch, and I sees as it's a fish! It goes runnin' along the branch like a squirrel and then goes flop into a little creek below. Well, I says to myself, 'Jaggs, old boy, you must 'a' got a sunstroke, and be turnin' a bit dotty, or you'd never be seein' such things.' By and by I sees another of 'em waltzin' up the tree trunk like a chipmunk, and I see as he was eatin' caterpillars and reg'larly enjoyin' hisself. I got used to 'em after that, meetin' 'em all over the woods; when they get tired o' stayin' in one creek they just strolls through the woods to another. I caught one of 'em, and it got quite tame—blessed if that bloomin' fish wouldn't follow me around like a dog! Now, Tommy, if you'll hand over them callas, I'll put the finishin' touches on this here work of art."

"I say, Jaggs," observed Tommy, as the men hunted up their hats preparatory to leaving, "Ain't you never thought o' writin' true stories about animals for a Sunday paper? Seems to me as that's just the field for your talents."

PTERIS TREMULA SMITHAE.

The pteris family is one of the most prolific among the ferns in the production of odd forms, and the variety we now illustrate is one of the most interesting that has been produced by the well-known P. tremula.

The latter species has long been in use as a florist's fern, though rather too strong a grower to be very useful for small ferneries, and besides in a small state is rather brittle, but as a 4-inch or 6-inch pot plant P. tremula is very attractive, and for planting out on a rock-work in a conservatory few species are better. But in P. tremula Smithae we have a more generally useful fern than the type, from the fact that its habit is much more compact, while it grows freely and also comes true from spores.

There have been other crested forms of P. tremula introduced at various times, but none that I am aware of in which the cristate habit has been so

fully developed as in P. tremula Smithae, the fronds being shortened and crested on the tips of all the pinnae in much the same manner as those of Nephrodium molle corymbiferum. As noted above, P. Smithae propagates readily from spores, the latter being produced with much freedom on old and rather starved plants, and the seedlings soon show the same characteristics as the parent plant.

The young plants will make better progress if kept moderately warm, for example about 60 degrees, and all of the ferns of this family being strong rooting will flourish in good soil, that is, in a bright loam well enriched with old stable manure. As an exhibition plant, this variety is very effective, and is well worth growing as one among an exhibit of 25 ferns.

But in growing any of these crested ferns to a large size one needs to watch them rather closely, and to keep them away from any other plants that may be infested with scale or mealy bug, for the cristate foliage forms a first-class harbor for insects, and once they become dirty it is almost impossible to clean them again, without sacrificing the whole of the foliage.

W. H. TAPLIN.

ROSE NOTES.

Roses should now have a mulch, for the sun is getting powerful, not so much to stimulate them as to keep the bed from needing an almost daily watering, which they would do in sunny weather and only a few inches of soil. There is yet two months for your Brides, Bridesmaids and Meteors to flower. Two months, if not of the highest prices, certainly of excellent demand and prolific crops. Stir the surface of the bed very slightly, or you will injure many roots; perhaps a cleaning is sufficient. Sprinkle on a little bone flour, a quart to 100 square feet of surface of bench will be plenty, then cover with a thin layer of rotted cow manure. If it were at all fresh manure, there is great danger of ammonia arising from it, and if a bright but cold day came and you could not ventilate freely, you would run a great risk of burning much of your foliage. There is also a fungus that quickly forms on fresh manure, the spore cases of which, when bursting, throw the spores all over the house, covering the leaves and petals thickly with little black specks, and they stick, too, much disfiguring the whole growth.

If you have not been successful in rooting your young stock or neglected to do so, there is yet time, if you have good, healthy wood. I would rather have a plant rooted from a cutting during the last days of March than much of the stuff I see sent out by firms by the thousand, cheap, apparently, but dear at any price.

Crimson Rambler Rose.

There will be seen this Easter many a magnificent plant of this rose, and doubtless they will command a large price and outsell any plant, and worthily, too. If you want to have any for another year, don't wait till fall, for this is not the way to do it. Purchase from some reliable nurseryman the good home-grown plants they have to offer; get them within a few weeks before they are started. Pot into 7, 8, 9, or even 12-inch, pots, if extra strong. Don't buy any but what are strong, and don't haggle over a few cents in the price; 5 cents' difference in price this spring may mean a dollar next spring, and your labor has been identically the same. Cut out weak shoots, if any, and shorten back the strong growths to one foot. If grown under glass, they would need to be put out of doors in September to ripen their growth, but they could be started and grown entirely out of doors till you wanted to force them. From the growth of this summer you will get the flowers for next spring, and the roots will not be disturbed. There is time enough to give a hint or two about their management this summer. The important point is to get the plants at once, while they do not feel the moving.

Hybrid Perpetual roses you can buy of our American nurserymen in the fall and force most satisfactorily the following spring; but this gorgeous Rambler should be well established before forcing is attempted.

WM. SCOTT.

THE BERMUDA EASTER LILY.

Lilium Harrisii is as well known today as the rose and carnation, while in the early eighties it was unknown to fame. Today it is one of the largest revenue-producing products of the tight little island of Bermuda, and is to be found in all the flower marts and bulb markets of the world. Of late years, however, disease has wrought sad havoc, from what causes it is hard to tell.

Though on British soil, it was American pluck and enterprise that brought the Bermuda Easter lily to fame, and now, while we are in the midst of its season, it is appropriate that something be said of this lily, which has almost revolutionized the Easter flower market.

It is very interesting to look back and note the catalogues containing the early history, prices and press articles regarding it, and to make comparisons with today.

In 1884 bulbs 4 to 5½ inches sold for $12 per 100, while today one-quarter that price, including duty, would be considered a fair price. In 1882 the New York Times, in its report of the New York Horticultural Society's meeting, May 3, says that nothing attracted so much attention as the collection of Bermuda Easter lilies which was shown and awarded a first premium.

A Short History.

The exact origin of the Bermuda Easter lily has always been shrouded in doubt. What it was, and how it was carried to Bermuda, no one knows. The best evidence that can be gleaned would lead one to believe that it was brought from the far East by some of the early English governors, and, luxuriating in the soil and climate of Bermuda, was probably distributed among the inhabitants and became common in the different gardens on the islands.

At first it was supposed that it was nothing but the well-known longiflorum, changed by having been grown in the fertile soil and favorable climate of Bermuda. When the value of the lily became known, and the supply proved inadequate to the demand, large quantities of longiflorum were sent to Bermuda, to be grown there, with the idea that the stock could be increased in that way. The result was that a great deal of the earlier stock became badly mixed by such importations. Of course, it is now well known that Bermuda-grown Harrisii and Bermuda-grown longiflorum are entirely distinct, and both as grown in Bermuda quickly supplanted all other sources of supply.

When the lily was first introduced into Bermuda, no one knows, but its cultivation there, in a commercial way, began in the fall of 1881 by Mr. F. R. Pierson, of Tarrytown, N. Y., whose attention having been called to the fact that the lily grew in Bermuda,

A Field of Lilium Harrisii in Bermuda.

made a trip there in November, 1881. One or two scattering lots had reached this country previous to this, but to Mr. Pierson belongs the credit of having introduced the cultivation of Lilium Harrisii commercialiy in Bermuda. Up to that time no one had discovered its value or its great possibilities. It was grown only by the inhabitants as other flowers were grown, and was very popular in Bermuda, being used largely for the decoration of their churches at Easter, it being in full bloom in their gardens at that time. No one had ever thought of its value commercially, or that it would become one of the main sources of revenue to the islands. Mr. Pierson's attention was attracted to it in almost an accidental way. One or two lots had reached the United States prior to this time. W. K. Harris, of Philadelphia, a few years previous, had received from a friend in Florida a few bulbs which had probably come from Bermuda, and had undertaken the culture of them in his greenhouses. Mr. Joseph Kift had also obtained a few barrels of these bulbs, direct from Bermuda, in the summer of 1881, which were distributed among a few of the florists here for forcing purposes.

During the fall of 1881 Mr. Pierson received a bulb from a friend who was living in Bermuda. He made a trip to Bermuda in November of that year, and it was due to this trip at this time that the cultivation of the Bermuda lily was begun in a commercial way in Bermuda. Recognizing its great value, and also the well-known fact that the bulbs were produced in the greatest perfection when grown in a soil and climate particularly adapted to their nature, Mr. Pierson made arrangements at once to undertake their cultivation in Bermuda, and entered into a partnership agreement with General Russell Hastings for the cultivation of Lilium Harrisii in Bermuda. The first bulbs offered by them for sale in this country was in the summer of 1883. The bulbs sold in those days would not be handled now, being what are now known as 4-5's. All the stock that could be obtained from the different gardens was secured, and the cultivation of the bulbs was at once begun on a large scale. The trade was quick to discern the value of this lily, and the supply was never equal to the demand, owing to which fact the bulbs brought high prices, making their cultivation a very profitable industry. This prosperous condition of the Bermuda lily business continued until about 1894 or 1895, when the output largely exceeded the demand, in consequence of which prices dropped below a profitable point. In 1896 the number of bulbs grown amounted to upwards of 4,000,000. Since that time the cultivation of the lily has been very largely curtailed and prices have advanced slightly each year.

The Bermudians soon found out that there was money in growing the bulbs, and one after another of the farmers there began the cultivation of the lily, adding constantly to the supply, until almost the whole island was one lily field, and until this industry had become one of the main sources of revenue in the islands.

Our illustration shows a field of Lilium Harrisii growing in Bermuda.

H. A. B.

NOTES FROM HINSDALE.

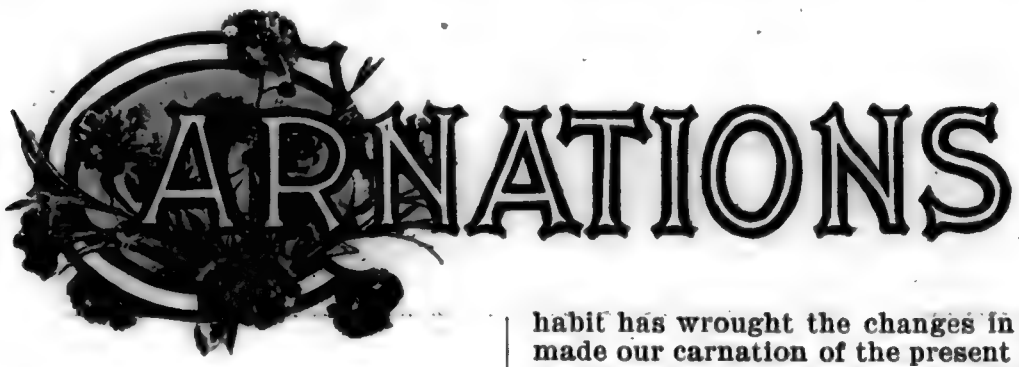
In addition to roses and carnations Harrisii lilies are a great specialty with Messrs. Bassett & Washburn at Hinsdale, Ill. They have been so fortunate as to have but little, if any, trouble with the Harrisii disease as yet, and their loss this season from the disease will not exceed 5 per cent. And they have taken no special precautions. They will cut about 25,000 blooms for Easter. They have found a larger percentage of diseased bulbs among their Japanese longiflorum than among the Harrisii. They are not at all satisfied with their experience with the Jap longiflorum, which do not grow strong enough, and produce many less blooms to an equal space.

They have several lots of sweet peas coming on and one batch will evidently be in good bloom for Easter. They are planted in solid center beds.

In one house was noted a lot of fine young stock of the new chrysanthemum, Mrs. O. P. Bassett. These are being grown for the F. R. Pierson Co., Tarrytown, N. Y., who are to introduce it. It is a yellow sport from Mrs. H. Robinson.

A house of Adiantum cuneatum that has produced freely for years is no longer giving satisfactory results. The plants do not seem to start good growth again and the fronds produced are small and without substance. They think the trouble is due to the previous close picking of fronds from the plants and will this year throw out the old stock and take a fresh start with new.

A house of smilax has been very profitable this season. They have cut four crops from the house during the season and all has sold at good figures.



They are now using coal for fuel entirely, having discarded crude oil altogether. The increase in the price of oil made the coal the most economical. On the place there are seven boilers, two of 150 horse power each, four of 100 horse power each, and one of 75 horse power, making a total of 775 horse power. Heating is by steam.

Artesian water is used and it has given perfect satisfaction except that the small amount of lime it contains sometimes spots foliage a little, especially the smilax.

Perfect apparatus for distributing liquid manure is provided. Cow manure is used mainly.

An improvement that will be added this season is a long shed in which soil and manure can be stored.

In marketing their product Messrs. Bassett & Washburn have noted a continued increase in the call for the higher grades of stock though prices have averaged more moderate.

THE EVOLUTION OF THE CARNATION.

It is well once in a while to give a backward glance, for thus we better realize where we are at now. The cultivation of the dianthus, of which our present carnation is an offspring, originating in the course of the evolution of this plant specialty, dates back centuries, beyond the resources at our command; it is shrouded in mystery.

To give an example of the evolution of a plant specialty, I will name one of more recent date, the dahlia. It is only a century ago when the first plants, a single red variety, were brought from Mexico to Spain, from where it found its way to other parts of Europe. And what has wrought this wonderful change in that genus of plants? Culture only. I remember so well when a boy running through the meadows of my native valley, in the black forest mountains of Germany, hunting for early spring flowers, one of them the common meadow daisy (Bellis perennis). I delighted in transplanting some of these single blooming plants from the meadows into the garden and watch the effect on them. Invariably the second year they generally developed into double flowers. The blush color in some changed to a deep pink, in others to a pure white, all the result of cultivation.

The dianthus, or common pink, underwent the same changes, the cultural treatment consisting first of all in an improved mode of cultivation, and next cross fertilization. The crossing of the extremes in color, form and habit has wrought the changes in and made our carnation of the present day. An improved higher cultivation is and will be the foundation of all improvement. We may make crossings with all possible care, grow seed, but lack in a careful, judicious cultivation, and the results will be a going backward, a tendency toward primitive conditions and with a more rapid gait than were our forward strides.

Under a common ordinary culture, seed growing is a much easier matter than under a high culture. All our improvements in color, size and flower, ever-blooming habit, stronger stem, in fact all the requirements of the present time, we have, so to speak, to wring from nature itself. She is rather unwilling, and often calls a halt, as most every grower of new varieties has evidence in the imperfection or total absence of one or the other of the sexual organs, refusing to produce seed, and closing the only means of further development. It is only necessary to call attention to the many thousands of seedlings grown every year and point to the very few that in the end will show an improvement over existing varieties, to realize the task of producing new ones. The tendency to return to primitive naturalness is very strong and any lack in cultural treatment will promote it.

When we look back, when we consult the history of this genus of plants, as far as it is traceable, we are overwhelmed with the wonderful changes, evolutionary changes, that required centuries to bring about. To all appearances, the color of the primitive variety was a purplish pink, single flower, often found yet among seedlings; and now look at the array of color, and size and form of bloom. The change in their habit is even more remarkable; from their short time of blooming, as yet shown in the garden pink, they have developed into ever bloomers. And I ask again, what has wrought these changes? Culture only.

To come from these backward glances to the present: All the fundamental principles in the evolution of the carnation that have been paramount in the past are still so in the present, and will be the same in the future. If we lack in our improved mode of culture we will go backward; if we do not further improve it, we will stand still. It is not alone the originating of improved new varieties wherein progress is manifest, it is as much the judicious mode of culture to sustain them. Nature may endow a new variety with a larger bloom, a stronger stem, and more freedom in blooming, a point so much desired at present, and if one thinks he can train such a variety down to an ordinary culture and retain all these qualities, he reckons without mother nature. To cut away two pounds of solid growth, consisting of stem and blooms, from a variety, with only the same allowance of cultural care and nourishment one will give another variety to grow one pound, is the same thing as when one expects an equal amount of work from a horse only half fed as from one that receives its full quota.

What is culture but a judicious supply of all the requirements a plant needs for its fullest development? and one of the foremost of these is the supply of nourishment to the full extent that a plant is able to assimilate. We can never expect a plant to grow and bloom to its fullest capacity when the elements that enable it to do so are not within its reach. It is amusing to remember, when at the beginning of the decade new varieties and larger, better blooms appeared, incredulous growers attributed it solely to a high manuring. They did not then admit a better care had its share also. But when the higher manuring (we say now feeding) and better care were improved upon, and became more judiciously and advantageously applied and still better results were obtained, they woke up to the necessity of following suit or stop growing carnations. And yet there is up to this date some that cannot make up their mind to deviate from their mode of cultivation of twenty years ago.

Our present stage of progress is not yet understood by many. They cannot comprehend where we are at. We arrive at phases incomprehensible to many. Chief among these is the scant production of suitable regulation cuttings by some of the newer free blooming varieties; even when the production of flowers is not greater in number it is certainly so in size of stem and bloom. The young growth matures earlier, assumes the formation of buds at once, and the result is that

many of these supposed regulation cuttings will push out buds before they have otherwise made any growth. But, according to my experience, when these buds are removed, as soon as there is any sign of them, and the cutting is well rooted, it will break at the lower joints, and make a bushy plant in a short time. My impression is that is only an indication of free blooming and should not be confounded with varieties that are croppers.

We can hardly conjecture what the future will hold for us. We will certainly not go backward, and we will not stand still. Our course is forward and onward. The growing of new varieties has a fascination that will be proof against any relaxation on that line. The danger of any diversion lies in the slow advancement of cultural improvements. One of the boldest, and to my impression the most far-reaching scheme in this line, is the subwatering as recommended by Dr. Arthur, of Purdue University. The more I think about it the more favorably I am impressed. It attacks the weakest point of our system of cultivation, and if predictions go for anything, it will revolutionize carnation culture. The greatest obstacle to all such improvements is the cost, but when once fairly tried and expectations are realized, the cost becomes a secondary matter. Our achievements of the past decade

Portion of a Bench of G. H. Crane.

NEW CARNATIONS AT DORNER'S, LA FAYETTE, IND.

are equal to the work of centuries before. We must not retard, our course is forward and onward.

FRED DORNER.

NEW CARNATIONS AT DORNERS.

Those who have been fortunate enough to have had the privilege of visiting the establishment of Fred Dorner & Sons Co., Lafayette, Ind., will bear me out when I say that it is a rare treat to see such fine carnations as are to be found here, and to meet with such a cordial reception from the members of the firm. One cannot but appreciate the hospitality which is so freely shown and feel like saying "it is good to be here."

Although a resident of Lafayette and so able to visit this establishment at any time, the writer feels that each visit has been more pleasant and profitable than the preceding one. On a recent visit I was so much impressed with the vigorous growth of a bench of White Cloud, and of G. H. Crane that I decided they were a sight well worth photographing. The necessary permission was cheerfully granted and the accompanying photographs are the results.

The White Clouds occupy a center bench in one of Mr. Dorner's 125 ft. houses and were photographed from the east end. The readers of The Review are doubtless more or less familiar with this variety, but perhaps a word or two here may not be amiss. It is one of Dorner's seedlings from Daybreak. In growth it is similar to the Daybreak type, though much heavier and averages more blooms per plant. It shows no tendency to crop, being a free continuous bloomer. The flowers are large, pure white, and supported on rigid stems twenty-four or more inches in length. The calyx is very free from bursting. White Cloud is being introduced to the trade this year, and will undoubtedly prove a money-maker to the florist, as it is unquestionably one of the best whites grown.

Bench of White Cloud.

In connection with what has already been said the writer wishes to call the attention of the reader to the photograph once more, observe if you will how every inch of the bench space is occupied by the plants, and bear in mind that these plants are set one foot apart each way. It is evident from this, that the plant is a vigorous grower when given the proper cultural conditions.

G. H. Crane is another seedling of Mr. Dorner's which bids fair to take a prominent place in the list of scarlet carnations. The flowers are large, averaging about three inches in diameter, calyx good, stems erect and stiff, length fifteen to eighteen inches. The plants are strong and vigorous, the foliage being covered with a heavy bloom, which gives them an unusually healthy appearance. At the recent exhibit of the American Carnation Society this variety was awarded a certificate, scoring ninety-two points. It will be introduced to the trade next year.

Special attention is here called to Mr. Dorner's system of supporting his

plants. The stringing for the support of the shoots and flowers is well shown in the photographs, especially in plate II. The inverted V shaped wire netting supports which rest upon the soil between the rows of plants are not, however, quite so well shown in the photograph, being obscured by the foliage of the plants. This is by no means the most insignificant part, for they serve not only to keep the lower foliage of the plant from contact with the soil, and admit air, but also afford an easy method of applying water to the soil without wetting the foliage.

Not the least interesting feature about the place at this time is Mr. Dorner's seedling house, in which several hundred varieties are being carefully studied. Mention might also be made of the propagating house, which is now being pushed to its utmost, in order to fill orders for rooted carnation cuttings. It is needless to say that everything about the premises and greenhouses betokens thrift and cleanliness, evidencing the fact that the firm of Dorner & Sons Co. attend to the minor details of their business as well as to that of the larger ones.

Exp. Station, Lafayette, Ind.

Miscellaneous Seasonable Hints.

Correction.

In my notes under this head of two weeks ago, I remarked that to bring in lilies and other plants just right for Easter you would have to resort to forcing, retarding and maneuvering. Unfortunately it got into print to read "manuring." Holy farmer, I trust those that do me the honor to read my lines will not think me guilty of using by intent such a misapplied word. The word maneuvering is just what I meant and fills the bill exactly, while manuring is both senseless and misleading as applied at this late date to any Easter crops. Perhaps it was the editor's fault, but the original sin lays at the door of an old man whose feeble pen wags in uncertain characters.

Azaleas.

Anything that can be said now about Easter crops will be of little avail; still to use that word once more, quite a little maneuvering can and will be done. The mild, beautiful and unprecedented weather that we have had since the first of the month has upset all calculations. Hyacinths are flowering outside almost, and if they are brought into the greenhouse by the 28th or 29th of this month they will be in ample time. Azaleas have come along much faster than we wished or expected. This is particularly the case with that well known sort, Madame Van der Cruyssen. We are removing them to a cool, light cellar and placing them so they can be carefully and properly watched for watering and tissue paper thrown lightly over them. You will notice that Van der Cruyssen has far more flowers than the plant can well develop without being sadly crowded. When removing them to the cellar, or if you don't have that convenience, beneath a bench in a cool house, you can pick off the flowers that are now expanded. They never will be missed, there are plenty more to come, and you will be giving them a good chance to develop; otherwise the open flowers may rot and injure those to come.

Lilies—Acacias.

The wonderful weather has brought Harrisii lilies along a little previous, but has also helped longiflorum to get there in fine shape. I would not remove any lilies to a very cool, shaded house until the earliest buds are about to open, then they can be as cool as you like. With the glass shaded, ventilators open day and night, if possible, and only enough fire heat to keep dampness out, you can keep lilies, spiraeas, lilacs and other plants about standing still. The beautiful Acacia armata, of which there were fine plants imported last fall, is with us a trifle early, although kept very cool all winter. They can be kept near the freezing point, but should not be damp, or their beautiful little globular flowers will decay.

Hydrangeas.

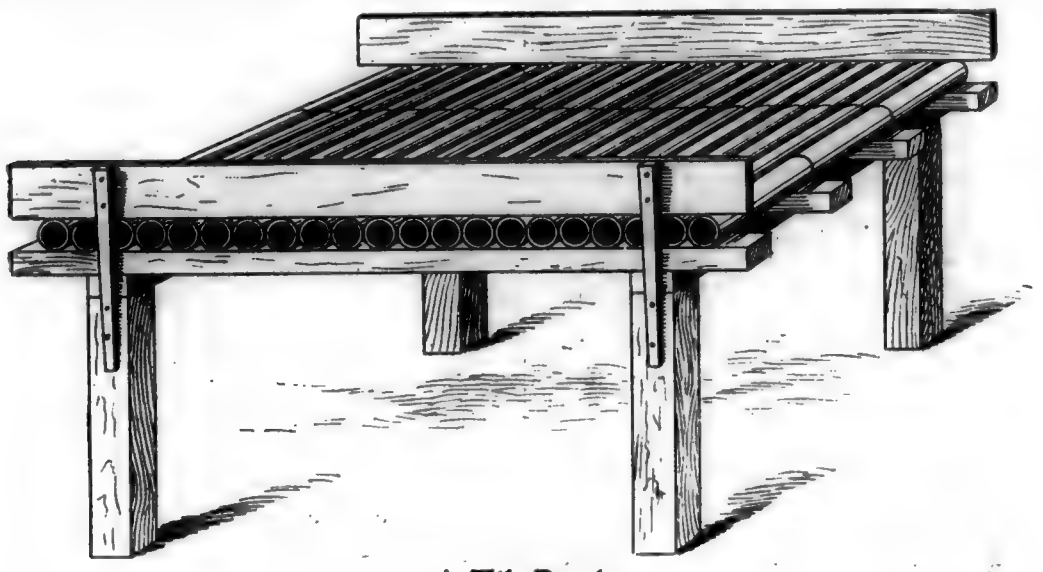
If your hydrangeas are well advanced in bloom, two weeks in a cool house will harden them up and help to make them more satisfactory to the purchasers. If you sell any of these forced hydrangeas, it will be good for your reputation if you will attach a ticket to each, reading: "Please water this plant every hour while awake."

Pansies.

The advice I gave some weeks ago about lifting pansies from the bench and putting half a dozen in a 6 or 7-inch pan has turned out with me very satisfactory, and they will be attractive and sell well. Don't let the flowers remain on a pansy plant; it does not last long, so keep the flowers pinched off till within ten days of Easter; you will have more when you need them.

Alternantheras.

It is a good time now to propagate that high-colored little plant, the alternanthera. If you have an abundance of old plants, you can tear them to pieces; every piece with the slightest bit of root attached will make a plant. But if you wintered them in flats, propagated in August, you can now put in the tops, and by the time they are ready to pot off from the sand, it will be time to have some hot-beds to receive them and the plants from the flats. A hot-bed is the only place to grow the alternanthera.



Tuberous Begonias.

It is now time to put your main lot of tuberous-rooted begonias in flats in a couple of inches of sand, or what I prefer, an inch of sand on top and an inch of rotted manure below. By the middle of April they will be large enough to pot, and a mild hot-bed is the place for them. They will then have six weeks to grow, and the last two weeks the sash can be removed, which makes the proper conditions to prepare them for the flower bed.

Herbaceous Plants.

If you grow herbaceous plants and your customers want any, don't delay planting after the ground is dry. Most all our well-known plants of this kind put up with very rough treatment, but remember, when transplanted, when they are almost dormant, or before they have made a start, they will scarcely feel the change at all. And don't spare the labor to dig deep and manure heavily. I have occasion to remove and give more room to several hundred paeonias. The ground is stirred one foot deep, and all the manure I can possibly work in, and the paeonias will be planted four feet apart each way. All herbaceous plants should have this liberal treatment, not all, of course, needing as much room. We call these herbs perennial, which is near enough, but they are far from being perennial as is an oak tree, and every few years want lifting, dividing and new earth and surroundings. If not, they get exhausted and dwindle away.

The perennial phlox is one of our best herbaceous plants, although I am sorry to say not of great use when cut, dropping the petals sadly. I have been told by one of our best known and widely respected florists that the Frenchmen grow the phlox as a pot

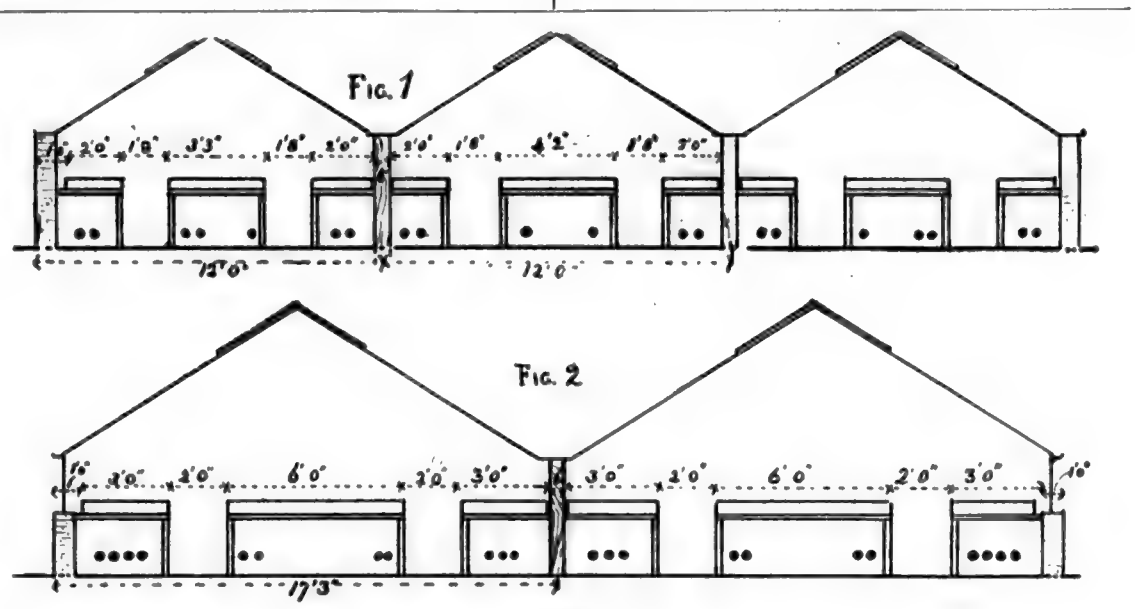
A Tile Bench.

plant, and sell great quantities during the summer. The variety known as "The Pearl," a beautiful white of rather dwarf and stout habit, is a good one for the purpose. To get them early, a clump could have been lifted in the early winter and kept dormant till February, then started in a little heat, and any amount of cuttings procured. It is not yet too late. Put the young growths in the sand; they will root readily, and can be shifted as they need it, but must be often pinched, to keep them from flowering and make them bushy and shapely. In June they would be in 4, 5 or 6-inch pots, or as large as you want them to grow. When they are compact plants, stop pinching, and you will soon have a handsome little plant, covered with flowers. Any variety can be treated thus, but Pearl is such a grand flower and so well known that it is a good one with which to give this plan a test.

WM. SCOTT.

TILE BENCHES.

We present herewith a sketch of the tile bench now largely used by Messrs. Bassett & Washburn, at their large establishment in Hinsdale, Ill. They are so well pleased with this style of bench that during the coming summer all of their remaining old style benches will be replaced with those of tile. They find the first cost of the tile bench 25 per cent to 30 per cent greater than the wooden bench, but a vast sight cheaper in the end as well as giving much more satisfactory results. While the drainage is perfect still the soil will not dry out so completely as with the board bottom bench. And benches that have been in use three years (the average life of a wooden bench here) are apparently in as good condition as ever. Mr. Bassett believes the benches will last as long as the houses.



The benches rest on cedar posts placed four feet apart. The cross pieces are 2x4, and the stringers upon which the tile rest are also 2x4. The tile used are 3-inch. The 2-inch would be slightly preferable, but the 3-inch cover so much more space for the same amount of cost that they are much more economical. On these benches five inches of soil are placed, as the drainage is so rapid this depth can be safely used, and depth is considered desirable where the drainage is such as to warrant it. The tile are a trifle over one foot long and three lengths are used on a side bench, five lengths being used on a center bench. Occasionally a few of the tile are broken in changing the soil, but this breakage is so infrequent that the expense on this account is insignificant. They have already used some twelve carloads of tile (the common porous drain tile) on their benches and would not think of building any other style of bench.

wide, I would suggest an arrangement of benches and 2-inch heating pipes as shown by Fig. 1, but a range of such houses would not be economical, as the cost would be considerably more and the bench surface much less and less convenient than if the houses were made wider. I would suggest his building only two houses and making them about seventeen and one-quarter feet wide, with bench and heating pipes arranged as shown in Fig. 2.

For the heating of either range, I would advise hot water in 2-inch wrought iron pipes as being the more desirable and the more economical in working, the arrangement of the running pipes being clearly shown in the cuts. The arrangement of mains and their capacity cannot be stated until it is decided as to the make and style of boiler to be used, and the exact location of same. I would place the boiler at the north end, opposite the center of the ends of the houses and connect to a chimney having a flue 12x12 inches and about 15 feet high above the floor of the houses. The boiler should have a grate surface of not less than 5 square feet, with its heating surface in proportion. Whatever boiler you decide upon using, be sure to procure one in which all flues and inner parts are readily accessible for cleaning purposes.

HENRY W. GIBBONS.

New York.

Heating.

HEATING.

I am about to build three greenhouses, each 12x100, for carnations. Which will be the most economical heating system, hot water or steam? What boiler and how many horse power? Size of pipe? Bottom or overhead? What would be best arrangement of benches? Houses are to be connected, but the space under the gutters will be open. Houses even span, with brick walls. S. H. E. M.

In answer to S. H. E. M.'s enquiry, should he decide to build the three carnation houses only twelve feet

GREVILLEA ROBUSTA (SILK OAK).

A subscriber asks from some one of experience with these trees whether they should be "stopped" or pinched at any time of their growth, and adds that he now has a lot which are 16 to 18 inches high and in 4-inch pots.

If they were sown in September they would be about a foot high now and would not need pinching. Those were likely sown in March or April and perhaps kept rather warm and grown rather long. They are best pinched, that is, just the top of the leading shoot picked out, when they are 7 or 8 inches high. It depends a good deal

on what you are going to do with these plants. If for vase or veranda boxes I would just pinch the top off at once. If you intend to keep them over as a decorative plant, cut off four or five inches of the top and give them a larger pot and room to grow when they make lateral growth. This grevillea is a pretty useful tree when quite small, but when large is coarse and not worth room in the greenhouse.

W. S.

LYCHNIS SEMPERFLORENS PLENISSIMA.

I send a photo of a few sprays of Lychnis semperflorens plenissima in a small vase. The flowers were gathered from little plants, divided into single crowns in the second half of January and not yet fairly established at the time of writing (Feb. 22). On older plants sprays are much longer and more branchy. Our stock out doors was nearly all disposed of in fall and we had to divide the housed plants to supply us with plants for another season. When I wrote the article published in The Review (Feb. 10) we had no flowers on them, else I would have furnished the print at that time, but the fact that the weak, little crowns are now again in flower is another evidence of how persistently this plant will send up flower stems and how readily it responds to a little care, though the same bench and soil was used where the old plants had flowered up to January, only a small quantity of well decayed manure having been added to the soil. In another month when all the plants will have gained their normal vigor, we may expect sprays twice the size of those shown here and I would perhaps have been able to furnish then a much better picture, but the general appearance and the size of the flower itself would not be any different. As I was requested to send in the photo at the earliest possible date, I did not want to wait until they were really at their best; at some other time we may be able to furnish a better picture. K.

VIOLET NOTES.

It is to be supposed that all persons who grow violets to any extent are exerting themselves now to hold them in good shape for Easter; after that they are practically valueless, anyway.

March, with us, has reversed the order of her usual behavior, and we have come unceremoniously from our cloudy, cold weather into such weather as we ordinarily expect in late spring. As a consequence we have had to shade again heavily, and in addition to that have had to run with the doors and ventilators wide open; in fact, have left them so quite a good many nights, even though the thermometer reached the freezing point about morning. However, this is the only way possible to keep the plants blooming as they should till Easter; by this I mean large, full blooms. Of the small semi-double there will be no lack for the balance of the season. Our fires have been out for some time, and the probability is that they will not have to be started many more times, unless we pay heavily for this spring weather a little later.

There is one point to be avoided at this time of the year that does not come so prominently into notice earlier, and that is having the sun come out on the flowers when there is any water standing on them; the result is faded, worthless, bleached flowers. We consider the best time to water, to avoid this, is after the sun gets low in the afternoon, and yet early enough so

Lychnis Semperflorens Plenissima.

that they are pretty well dried off by dark. Of course, the houses which have just been gone over for shipment are where we do the heavy watering, still all the houses require a great deal now, with the evaporation that naturally comes from the sun and wind with the houses open.

The natural course, at this season of the year, is for the plants to turn their attention to making new growth and runners, and if allowed to do so you can bid good bye to flowers at once, and for the season. For this reason run as cool as is possible. Remove all good runners for stock, if you have not already worked up a sufficient supply, and keep all the small and poor runners trimmed off closely.

LYCHNIS SEMPERFLORENS PLENISSIMA.

I send a photo of a few sprays of Lychnis semperflorens plenissima in a small vase. The flowers were gathered from little plants, divided into single crowns in the second half of January and not yet fairly established at the time of writing (Feb. 22). On older plants sprays are much longer and more branchy. Our stock out doors was nearly all disposed of in fall and we had to divide the housed plants to supply us with plants for another season. When I wrote the article published in The Review (Feb. 10) we had no flowers on them, else I would have furnished the print at that time, but the fact that the weak, little crowns are now again in flower is another evidence of how persistently this plant will send up flower stems and how readily it responds to a little care, though the same bench and soil was used where the old plants had flowered up to January, only a small quantity of well decayed manure having been added to the soil. In another month when all the plants will have gained their normal vigor, we may expect sprays twice the size of those shown here and I would perhaps have been able to furnish then a much better picture, but the general appearance and the size of the flower itself would not be any different. As I was requested to send in the photo at the earliest possible date, I did not want to wait until they were really at their best; at some other time we may be able to furnish a better picture. K.

VIOLET NOTES.

It is to be supposed that all persons who grow violets to any extent are exerting themselves now to hold them in good shape for Easter; after that they are practically valueless, anyway.

March, with us, has reversed the order of her usual behavior, and we have come unceremoniously from our cloudy, cold weather into such weather as we ordinarily expect in late spring. As a consequence we have had to shade again heavily, and in addition to that have had to run with the doors and ventilators wide open; in fact, have left them so quite a good many nights, even though the thermometer reached the freezing point about morning. However, this is the only way possible to keep the plants blooming as they should till Easter; by this I mean large, full blooms. Of the small semi-double there will be no lack for the balance of the season. Our fires have been out for some time, and the probability is that they will not have to be started many more times, unless we pay heavily for this spring weather a little later.

There is one point to be avoided at this time of the year that does not come so prominently into notice earlier, and that is having the sun come out on the flowers when there is any water standing on them; the result is faded, worthless, bleached flowers. We consider the best time to water, to avoid this, is after the sun gets low in the afternoon, and yet early enough so

Lychnis Semperflorens Plenissima.

that they are pretty well dried off by dark. Of course, the houses which have just been gone over for shipment are where we do the heavy watering, still all the houses require a great deal now, with the evaporation that naturally comes from the sun and wind with the houses open.

The natural course, at this season of the year, is for the plants to turn their attention to making new growth and runners, and if allowed to do so you can bid good bye to flowers at once, and for the season. For this reason run as cool as is possible. Remove all good runners for stock, if you have not already worked up a sufficient supply, and keep all the small and poor runners trimmed off closely.

R. E. SHUPHELT.

OUR GENERAL INTRODUCTION.

No. 7

Every subscriber is requested to send his photograph (cabinet size preferred) for use in our general introduction, but please do not send us photos that must be returned, as we have to cut them in arranging the groups, and do not send tintypes, as these are not available. In sending photos please be sure to write your name and address on the back.

SOCIETY OF AMERICAN FLORISTS.

The executive committee of the Society of American Florists and Ornamental Horticulturists held its session in Washington, D. C., on March 15th and 16th. Many matters of importance concerning the future policy of the society and the management of its various departments were taken up and carefully discussed.

It is not the purpose of this communication to give in detail all the matters which occupied the committee's time, but merely to give briefly the conclusions arrived at in some of the matters of special interest to the

OUR GENERAL INTRODUCTION. No. 7.

society members and the trade in general. The most radical departure from the past policy of the society was the adoption of resolutions establishing a number of departments under the society's management, calculated to secure to members of the society direct benefits which are likely to make membership in the organization desirable and necessary to every one identified with the florist's trade. These departments are to be established under the following titles: Department of Credit Information, Purchasing Department, Legislative Department, Arbitration Department and Claims Department. Each of these departments is to be under a committee appointed by the president, with the approval of the society and the title, in each case, indicates its work.

The duty of the committee on credits will be to furnish information concerning the business standing of persons in the trade; said information to be supplied to members of the society at one dollar per annum and all other applicants at five dollars per annum. This committee was constituted to consist of the secretary with Messrs. H. B. Beatty and Adam Graham, and was instructed to proceed at once to secure necessary data for putting the department in operation.

It was decided that the Purchasing Department should also begin work at once to secure for members of the society through co-operation and the purchasing of large quantities of material, lower rates upon such supplies as glass, iron pipe, coal, etc. Messrs. E. M. Wood, W. W. Coles and W. K. Harris were constituted the committee.

The legislative committee will be entrusted with the duty of watching for and discouraging adverse legislation, either state or national, and encouraging such legislation as shall be considered favorable to the trade. The committee already acting for the New York Florists' Club on similar work, consisting of Messrs. Patrick O'Mara, J. N. May and C. H. Allen, were endorsed and appointed to represent the Society of American Florists in a similar capacity.

The purpose of the Claim Department is to act on behalf of the members of the society, to look after the adjustment of claims against transportation companies.

The arbitration committee will be entrusted with the duty of helping members to settle mutual differences without recourse to law.

The two latter committees were not constituted by the executive committee—the necessity for immediate action not being apparent, but the committee will recommend to the society at its meeting in August that they be established—the secretary to be a member, ex-officio, of the committee in each of these departments.

In response to what seemed to be a general demand for a revision of the method of making awards at the trade exhibitions, it was decided that the past system of awarding certificates should be discontinued and the competitive features heretofore encouraged eliminated. The old rule in reference to the making of awards was replaced by the following: "Judges shall examine all exhibits and make mention of such as are, in their opinion, of special value, and shall only award certificates to new plants, improved appliances, and approved florists' requisites, not previously exhibited before this society." It was also voted that all parties hereafter, who win awards of value, shall qualify themselves as members in good standing before receiving such awards.

All other matters relative to the management of the trade exhibition at Omaha was left to a committee consisting of the president, vice-president and secretary, who will visit Omaha early in May and make all necessary arrangements towards securing a successful convention in all its departments. Propositions looking to the securing of a special train to travel from some eastern centre to Omaha and take up delegates at various points en route, were also referred to the same committee.

The following subjects for discussion at the sessions of the convention were selected: The American Bulb Industry (and, incidentally, the Lily disease; its cause and its remedy), discussion to be opened by Mr. M. G. Raines, of the Department of Agriculture, Washington; Trade Exhibitions, their value to the florist's trade, to be opened by Mr. E. H. Cushman, Euclid, O.; The Influence of Public Parks, Grafted Roses for growing under Glass, the Effect of Improvement in Varieties and of Improvement in Cultural Methods, were all selected as subjects to be discussed, and to be assigned at a later date to competent persons. How to interest the retail trade in artistic decorative work was a subject discussed at length, and a general invitation will be sent out for a contribution of photographs of such work, to be shown at the exhibition hall in Omaha.

The carnation, chrysanthemum and dahlia societies will be invited to provide one essayist each on subjects connected with their special work. It was decided to offer the same number of silver and bronze medals for competition at Omaha as was offered at Providence last year, one of which will be given to the best exhibit of American grown bulbs and the balance of the schedule to be announced later.

The treasurer's report showed the gratifying fact that there is a balance of $135 more in the treasury than at a corresponding date last year.

On the committee table was a vase of magnificent blooms of the rose Golden Gate, grown and contributed by Gude Brothers, of Washington.

W. J. STEWART, Secretary.

THE FLORISTS' REVIEW

G. L. GRANT, EDITOR AND MANAGER.

CO-OPERATION.

This issue of The Florists' Review will reach many who are not yet subscribers, but whom we would like to add to The Review family. To such we wish to emphasize the fact that the Review is a subscribers' paper and not purely an advertisers' paper. The character of the matter it contains and the high standing of its leading contributors are sufficient in themselves to stamp the paper as one you cannot afford to be without. But when you become a subscriber to The Review you are something more than a mere reader. You have a direct financial interest in its earnings, toward the increasing of which you can very materially contribute.

You not only receive the best paper in the field, but by buying your trade supplies from advertisers in The Review you can increase its revenues, and a goodly portion of this will be returned to you at the end of the year. What has in the past gone to make fat dividends for a favored few will now be distributed among those who make the earnings possible.

Each subscriber receives a certificate entitling him to the earnings on one dollar's worth of stock in the company that publishes the paper. This stock is held by Mr. William Scott, of Buffalo, N. Y., as trustee. Every legal requirement has been complied with. See our subscription offer and the form of certificate we issue elsewhere in this number.

Leaving above entirely out of consideration, can you afford to miss Mr. Scott's Miscellaneous Seasonable Hints? These are beyond question far and away the most valuable contributions to the current literature of the trade. Mr. Scott writes exclusively for

the Review. And can you afford to miss Mr. Dorner's Carnation Notes? All must admit that no other contributions to the literature of the Divine flower approaches them in value.

THE FLORISTS' MANUAL.

In this issue appear several articles from the advance sheets of the Florists' Manual, now being written by Mr. William Scott. This great work will cover the whole field of commercial floriculture, and will be an invaluable book of reference. It will be published by the publishers of The Florists' Review. Mr. Scott aims to make his Florists' Manual the crowning work of his career as a contributor to the literature of the profession, and all who have admired his past writings know what this means. We shall from time to time publish in The Review further extracts from the advance sheets of the Manual.

CINERARIAS.

[From advance sheets of the Florists' Manual, by William Scott.]

What florists understand when we speak of cinerarias are those which have originated from C. cruenta. The hardy species, although acceptable plants for the herbaceous border, where hardy, are not of much value to the florist. Since the introduction of the cineraria, or rather since its common use as an ornamental plant in our greenhouses, a wonderful improvement has been made in size, color and form of flower as well as in the habit of the plant. They are of easy culture and it may be said that any glass structure, where it does not actually freeze, will grow cinerarias. But like many other of these soft wooded plants which can be called "a cheap plant and easy to raise" a slight mistake or neglect will ruin the whole lot. A palm or an orchid will be much less liable to permanent injury by neglect or mismanagement, for what is a cineraria but an abomination unless it has broad, stiff, healthy leaves, and if it has those it will be sure to have a handsome head of flowers.

It is quite possible that some choice varieties are still perpetuated by cuttings, as they commonly were years ago, but that with the American grower is never thought of, neither is it at all necessary, for a fine strain is readily produced from seed supplied by our leading houses. Double varieties were also a novelty a few years ago and supposed to be a great acquisition, but the cineraria, like some other florist's flowers, is not in the slightest degree enhanced in beauty, either as an individual flower or as a decorative plant by its being double. It is simply a monstrosity and the craze for the double varieties has vanished.

If flowering plants are wanted by November and the holidays, you must sow at end of May or early in June. Except on private places this is not to be recommended. For the commercial florist they would not be very profitable for they are a troublesome plant to carry through the hot months and the bulk of your customers are not ready for them till February, March and April. It is well to make two sowings, the first early in August, the latter the middle of September; the last sown will usually come in right for Easter. The seed is not so small but what it can have a slight covering; finely sifted leaf mould or sand will do, and keep uniformly moist till the seeds are up.

When they have made a small character leaf, transplant into a flat or 2-inch pots. From this time on they must be shifted on as they need it, never by any means allowing them to become stunted for want of larger pots. After they leave a 3-inch pot the soil should not be sifted. If it is a little rough or lumpy so much the better. I have seen hundreds of cinerarias in 4 and 5-inch pots die, not with a slow death but suddenly droop and die, and the cause was a close adhesive soil through which the water did not pass freely. They may not be a profitable plant, but if worth growing at all will surely pay to grow well. They must have room to spread their leaves, and until flowering time 40 degrees at night will suit them better than a higher temperature. You will often hear instructions given to "keep plants near the glass;" in other words this means light. They must have light, room to spread out, a cool temperature, and although a stagnant state of the soil is fatal to them should never be allowed to wilt from dryness or they will lose some of their best leaves. After light, air and a low temperature, the remaining great object to watch in their successful culture is never let a greenfly be seen on them. Fumigate regularly and faithfully.

Those that are summered over do much the best in a pit or cold-frame, but it should be deep enough so that when ventilation from the raised sashes is given it should pass over their tops and not be playing too freely on their soft leaves. Specimens can be given an 8 or 9-inch pot, but the commercial florist will find that a 6-inch will flower them sufficiently well. I have seen some growers pinch out the leading flower shoot to induce a broader head of bloom. If grown cool and light this is entirely unnecessary. It is seldom that cinerarias are troubled with thrips or red spider, but a dusting of water in summer and fall is beneficial to them.

Cineraria.
[From The Florists' Manual, by Wm. Scott.]

HERBACEOUS CALCEOLARIAS.

[From advance sheets of the Florists' Manual, by William Scott.]

There are few more attractive and showy greenhouse flowers than the calceolaria, and although useless as a cut flower it is of great value as a greenhouse decorative plant, or as a window plant, lasting fully as long as a cineraria and many other of our popular flowers. There are several species, both of the herbaceous and shrubby sections, nearly all from the west coast of South America and at a good elevation, for calceolarias dislike great heat at any time of their growth.

Little attention is paid to the species, the beautiful hybrids of the herbaceous section being what we are interested in. Seed can be obtained of any reliable seedsman that will produce a great variety of beautiful flowers. Sow from June to end of September. If wanted in bloom by March the earlier month is the time to sow, but they are difficult to have in bloom that early; if sown in September they

can be bloomed the following May, and with less risk of failure than earlier. The seed is most minute and for directions about sowing refer to chapter on that subject. Would say here that it should never be covered, a piece of glass over the seed pan being sufficient.

When the little plants are large enough to handle place them in pans or pots an inch apart. When they are near touching each other put into 3-inch pots. By December they will be large enough to go into 5-inch pots and as they must be wintered cool they will not need another shift till the first of March, when they can go into their flowering pots, a 7 or 8-inch.

Calceolarias are not as often seen in either the florists' windows or the private garden as their great beauty should warrant, and the reason is that although they cannot be called a difficult plant to manage, they are easily ruined by neglect or mismanagement. The following conditions if faithfully observed will insure success.

Watering: At no time must they be allowed to wilt for want of water, and like the cineraria must never be over watered or that will kill them; avoid extremes both ways. No syringing is needed.

Temperature: In the dull, dark days of winter 40 degrees at night is plenty warm enough. In Europe they are largely grown in cold-frames. Here that is not as practicable, but from seed sowing till middle of November a cold-frame is much the best for them. Let them at all times be so situated that they can have light, room to grow, plenty of fresh air and a low temperature. Bright sun coming suddenly in early spring is liable to burn their leaves, so a temporary shade should be provided, but not a permanent one till they are near flowering time.

Soil: A rather light loam, not chopped or sifted too fine, with a fourth or fifth of thoroughly rotted manure, will grow them well. If the soil is heavy add sand to the manure. I am sure it pays well when they are in the larger pots, the 5-inch and upwards, to drain with a few crocks and a piece of green moss.

Insects: They are seldom troubled with any but the common greenfly, but to those the calceolaria is a choice morsel and too often a fine batch of young plants is utterly ruined by them. Don't wait till you see the fly, but smoke mildly every week at least without fail, and till they are taken to the show-house should always have tobacco stems strewn among the pots. There is no feature in the cultivation of the calceolaria so important as this; never let aphis be seen on them.

The shrubby section of calceolaria is used in Europe largely as a summer flowering garden plant. The writer has tried it here several times but always with failure and that I believe is the general verdict; our hot summer is the obstacle. As a flowering plant for the greenhouse they are not nearly as ornamental as the herbaceous varieties. The same cultural directions will apply to them excepting that they are usually propagated by cuttings, which root readily in the fall in a cool, shady frame.

Herbaceous Calceolaria.
[From The Florists' Manual, by Wm. Scott.]

NEW YORK.

The Wholesalers.

The less said about the market and prices the better, this week. Lent has gotten in its work with a vengeance, and prices have been as low as any time this winter, and as irregular as a day in April. A fair indication of business may be understood when I say that Mr. John Raynor, the Beau Brummel of the street, is wearing a blue necktie. Next week, if trade continues, they will go into mourning.

A continuance of warm weather has riddled prices, and there are no settled values. Shipments of roses are daily increasing, with a falling off in quality, which was most apparent in Maids. Long Beauties are getting to be a glut, and the price is correspondingly low, some having been sold as low as 5 cents and not higher than 15 cents.

Carnations are selling comparatively well for the number received, fine Scotts reaping the benefit, if any.

People who have smilax have the best thing in the market at this writing, and the only thing that has advanced in price. Other lines are all at a discount, and to quote prices would be like figuring on May wheat and cause my ostracism on the street from now and henceforth. But brace up; Easter will soon be here, then it will be your turn again.

"The two Macs," MacDonald and McManus, who are making a specialty of orchids, among other varieties are handling some specially fine flowers of Cattleya Trianae and Mendellii.

Walter F. Sheridan is handling the new white carnation, "Monarch," grown by F. W. Miles, Plainfield, N. J. If the price realized for these blooms is an indication of its stability, it will be the white carnation of the future.

Thorne & Co., Flushing, L. I., are sending some grand Maids and Brides to John Raynor. Mr. R. handles an exceedingly fine line of goods and is making goodly preparations for Easter.

James M. King handles the dark maroon carnation, Meteor, grown by F. R. Barrett, Highwood, N. J. The flowers are large and of exceptional color, with stems 30 inches in length.

Millang & Co., in addition to their cut flower department, will open an annex for the handling of Easter plants, which has proved very successful in former years.

M. A. Hart, who recently moved into more commodious quarters, finds that increased facilities means increased business. Mr. Hart handles a general collection of cut flowers, roses and carnations being the leaders.

Seed and Bulb Trade.

The exceptionally open winter has transformed the seed stores into hives of bees. The rush is unprecedented for the time of year; one house alone is five days behind with their orders, and "they're still a-comin'." As I write,

Herbaceous Calceolaria.
[From The Florists' Manual, by Wm. Scott.]

however, there are flurries of snow in the air, and it seems as if the order of the "lion and the lamb" is about to be reversed, but we are too far advanced in the month to expect much more winter, for, if you recollect, the ground hog saw his shadow this year.

The spring bulb trade has been very satisfactory so far, though prices have been cut to low ebb. "The men on the road," commercial travelers, I think they call themselves, are sending in some heavy orders, and are already quoting prices on fall bulbs, which are problematical at this early date. The sale for dahlias is exceptionally heavy and Japan stuff has moved very lively. Other lines are quite up to the average.

The youngest firm in the trade, Stumpp & Walter Co., feel much flattered with their first season's business. Mr. Henry Eike, the genial secretary of the company, is kept busy drumming up outside trade, and says the Craw fertilized pot is a winner.

Suzuki & Iida announce they have moved to more commodious offices in the Bowling Green building, No. 11 Broadway, and say the call for Japan stock has been phenomenal.

H. H. Berger & Co. report that they are getting an extraordinary number of inquiries for Lilium longiflorum bulbs. This commodity seems fair to rival its first cousin, Lilium Harrisii, in the future.

Clucas & Boddington Co., large handlers of Asparagus Sprengerii, say that the demand for plants has entirely exhausted the supply of imported stock. This variety is meeting with exceptional popularity in the retail stores, when cut, and also as plants. They report, also, heavy spring sales in all lines.

Various Notes.

Mr. F. L. Atkins has disposed of his interest in the American Bulb Co., and will in future trade under his own name. He was recently appointed sole agent of the Societe Horticole Gantoise, of Belgium, and will handle besides a general line of horticultural stock. Mr. Atkins is an F. A. M. and a thoroughly posted man in his line, the florist's trade, and worthy of generous support. His address in future will be Orange, N. J.

PHILADELPHIA.

Stock—Prices.

Business both in plants and cut flowers was quiet last week. A good many palms were moved for Easter orders, especially of the larger sizes, and orders are being booked for flowering plants to be delivered early next month. The price on most cut flowers has fallen, and much stock goes on the street or fails to find a market at all. Beauties bring from 50 cents a dozen for very short stemmed flowers up to $4 and even $5 for a few specials; $1.50 to $3 will buy nice blooms. Brides and Maids are $4, $6, and a few specials, $8; Meteors, $2 to $6; carnations, $1 to $3, the bulk of the stock bringing $1.25 to $1.50; valley, $2 to $4; callas, $10; Easter lilies, $10 to $12; pansies, 25 to 50 cents; violets don't sell at all; mignonette, $2 to $5; sweet peas, 75c to $2.

Germantown Hort. Society.

The March meeting of the Germantown Horticultural Society on Monday evening was well attended. The society showed its progressive spirit by accepting the committee's report proposing to abandon the annual chrysanthemum show, substituting special exhibitions of the orchid, rose, carnation, violet and plants, both flowering and foliage, instead. The committee was continued with instructions to report a definite plan. This does not mean that the society will discourage chrysanthemum growing; far from it. It simply means that the Queen of Autumn will share honors with her sisters instead of monopolizing public interest. The principal exhibition will probably be held as formerly in November.

It was moved by Mr. L. Le Boutillier that the society institute a competition for the best lawn and flower garden, with prizes amounting to $200, the idea being to attract the small property holders to compete. A committee was appointed to work up the plan.

Penn. Horticultural Society.

The following evening, Tuesday, saw the Pennsylvania Horticultural Society assembled to hear Mr. L. F. Homer's paper on "The Progress and Development of Ornamental Planting at Cairnwood," where Mr. Homer is gardener.

It was decided to continue the society's representation in the State Board of Agriculture, Edwin Lonsdale, who has so ably filled that position in the past, being continued as representative.

The Cinerarias for the Henry F. Michell prize were exceedingly fine. First went to John McGowan, gardener to Wm. Bayard, of Germantown; second to J. McGregor, gardener to Mrs. Thomas A. Scott, of Lansdowne.

Francois Supoit brought violets, Princess of Wales, which is becoming very popular, Luxonne, and also a new variety, La France.

Roberts Le Boutillier's gardener, Michael Punch, showed a fine specimen Cymbidium Lowianum both here and on the previous evening in Germantown. Additional interest is given Mr. Le Boutillier's orchids by the fact that he has himself collected every plant in his greenhouse.

Effect of the Tariff.

A good deal of discussion has lately taken place on the exact effect of the tariff on the price of imported bulbs and plants, whether the grower or consumer pays the duty. Theoretically the consumer pays it. I am, however, led to believe that this is only partly true this season and that the extra expense has been shared in many cases. The price of one line of merchandise, largely imported for this market, was started at about twenty-five per cent advance over last season and

the demand was so brisk that everything looked prosperous for a fortnight, when suddenly things were different and prices went as low as last season.

From many sources of information I am inclined to believe that growers hereabouts are a little disappointed on the effect of the duty so far as bulbs are concerned. They probably discounted the good effect on general business a little too heavily, failing to allow sufficiently for the fact that this class of stock is to a certain extent on the back track now. Many growers reason that the duty will prevent the small growers importing their usual supply; so they generously increase their own orders to prevent a shortage. It seems the small men didn't scare worth a cent and the public wanted bulbs most when they couldn't get anything else.

Notes.

George Anderson has the record for lilies. He bought 1,000; received 1,005; two didn't come up; two were broken in handling; he has 1,001 good plants. Where did you get them, Mr. Anderson?

The failure of D. D. L. Farson was announced on Friday. This is sincerely regretted not only on Mr. Farson's account but also on that of Wm. Gibson, who worked so hard for his employer.

A lady on Chestnut street priced a nice little bunch of Maids. "Six for a quarter, ma'am," the vender said. As she moved across the street he pursued her. "Say, lady, eight for a quarter," he called. She shook her head. "I guess you want 'em for nothing," the disgusted fakir muttered.

J. W. Y.

CHICAGO.

The Market.

The market is experiencing many ups and downs, and it is difficult to say what the next day may bring forth. One day the demand will be brisk and prices correspondingly stiff, and the next day the weakness will be painful. Shipping orders have, however, been fairly steady, and this demand has prevented any serious gluts, except in violets and some bulb stock, though there have been many sales of lower-grade stock at cut rates. On Tuesday the quotations on tea roses ranged from $2 to $4, with occasional sales of extra select at $5. Carnations of ordinary varieties from $1.25 to $1.75, with $2 for extra good. Tulips and daffodils from $1 to $2; some of the extra quality going a little higher. The outlook for a good supply at Easter is excellent, and from the advance orders already placed the demand will be strong enough to take it all. Unless some unforeseen circumstances intervene, the Easter trade of 1898 will be a record-breaker. Certainly the present Lenten season has broken all previous records for good sales. May the good work go on.

Various Items.

"Lilies and other bulbous flowers" is the subject for discussion at the meeting of the Florists' Club this Thursday evening. The programme includes a paper on the Harrisii disease by Mr. E. Buettner.

Mr. Louis Gresenz, with Bassett & Washburn, was married last Tuesday. The bride was Miss Julia Reg. Congratulations are in order.

"Welcome Spring" were the words outlined in crocus flowers that greeted visitors to Lincoln Park last Sunday. Mr. Stromback is to be congratulated on this bit of sentiment.

We learn from Mr. J. S. Wilson that the report that one of his brothers died on the way to Alaska was erroneous. We are pleased to be able to correct the false report.

Carl A. Lundstrom, one of the old landmarks in the trade, died last Saturday of paralysis, aged 65 years. He was born in Sweden, and has been in America fourteen years, doing landscape work. The funeral took place last Tuesday, the interment being in Graceland. Many friends were in attendance and the floral tokens were numerous. Mr. Lundstrom left a widow and four grown sons, one of whom is connected with Lincoln Park.

The wife of John C. Ure died last week and was buried Sunday. Death was caused by a cancer in the stomach.

Recent visitors: R. L. Blair, Des Moines, Ia.; Geo. Faber, Kankakee, Ill.; F. Danzer, Columbus, O.; Robt. Craig and John Burton, Philadelphia, Pa.

E. E. Peiser, of Kennicott Bros. Co., has returned from his outing, and is again in the harness. Larry Kelly has returned from a visit to his grandparents in Milwaukee.

Mr. O. P. Bassett, of Bassett & Washburn, entertained Robert Craig and John Burton, of Philadelphia, at his home in Hinsdale last Tuesday.

A. L. Randall will remove from Dearborn street to larger quarters at 4 Washington street the last of this week and will be in shape to handle his Easter trade at the new location.

Chas. H. Fisk has removed to 169 Wabash avenue, where he has a very neat basement store.

BUFFALO.

Stock for Easter.

The remarkable mild weather with many fine days has helped business some and plants have sold freely, but there has been no heavy business except that associated with the dear departed ones, and there has been quite the average of that sad but lucrative work. All guesses about crops being on time have been confused and confounded by the long spell of New Orleans kind of temperature.

I ran around a little the other day and got an idea of what there is in the county. W. J. Palmer, in addition to his fine cut of carnations and roses, has a fine lot of bulbous stuff, lilies and azaleas. He swears pretty loud about the disease and has good cause to do so. Joseph Rebstock has as usual a very clean lot of lilies, azaleas, rhododendrons and smaller lots of other useful stuff. John Pickleman, of French street, has the banner lot of lilies. Out of several thousand but a few hundred will miss the mark. Several other calls revealed a good assortment, which I will report next week with others yet to visit. For the past two or three weeks there has been far too many daffies and tulips forced here; with some firms who have them wasting they have descended to the unhealthy price of 25 cents a dozen. This is a ridiculous price and it would have been cheaper to feed the bulbs to the pigs soon after paying duty on them.

There does not seem any surplus of good flowers. Roses of phenomenal quality arrive in town and splendid carnations meet with a ready sale. I notice again to-day that Dazzle, that splendid scarlet that never receives a great puff, is grand in stem, form and color.

A Week for the Drummers.

This has been a week long to be remembered by the writer. Drummers have been here as thick as locusts in Egypt and fairly covered the land. They have come singly, in pairs and in flocks. Very early in the week, in fact the Sabbath day, arrived Dan McRorie and Walter Mott. I accompanied this pair to the Botanic Garden to protect the poor professor from being killed with kindness. Each put on their respective styles of amiability, which was worth a little suffering to witness, but the man from the banks of the Delaware got the best of it. He received an order for a trade packet of Erysimum Perofskianum. Then followed several from across the sea, whose names I cannot either write or pronounce. Then Mr. Hutchison, representing Mr. Aug. Rhotert. As the name implies, this young man is not one of those who belong to the land of black and white cows, wooden shoes and deep rich soil. He is a native of that prosperous country, Australia, and proud of it. When Mr. McH. keeps his order book in his pocket he is very interesting, and is well posted about the laws and institutions of his far distant home. Then the old war horse, John Barclay, stepped up and talked in the interest of Messrs. Elliott & Son.

The last gentleman who had anything to sell was Mr. J. P. Ohmstede, who solicits orders for Mr. Kuyk. If there is such an institution as Harvard College in Holland, Mr. O. must be a graduate. He also looks to have passed

View in the Store of Henry A. Dreer, Philadelphia.

through a gymnasium and sanitarium.

We had a very pleasant talk about azaleas, and Mr. Ohmstede confirmed the good opinion I had formed of four grand varieties, which it would be worth while for some of your readers to make a note of. They are: Memoire de Louis Van Houtte, a very large, double rose flower, easily kept back for Easter; Prof. Wolters, a charming pink of the finest habit, and the beautiful combinations of Mme. Thibaut pelargonium, but brighter; it makes all the azaleas of that color look dull; is about the same time in flowering as Van der Cruyssen; Edmund Vervaene, a deep rose in color, the shade of Cartledge carnation, very double and makes a splendid bush; the other has a name that would kill an ordinary plant, and I cannot describe it, but you can depend that it's a dandy, or I would not have saved the name, and here it is: Groshersog Griuz Ludwig Von Hesse, which means "his majesty was no hog." All four varieties are grand, and we want a change. There is too much Van der Cruyssen about, even if it is a grand old sort.

However, the longest lane has a turning and there is an oasis in every desert, and the oasis came to us in the shape of Mr. Elmer Smith, of Adrian, Mich. What a treat a few hours' visit from a man of that kind! I put him on the car on his road to see Mr. Cowell and trust ere now he is in the bosom of his family, recuperating from the complaint of the executive committee and Washington society.

W. S.

ROCHESTER, N. Y.

The cut flower market is overstocked in all lines. Trade has been very sluggish during the last two weeks and there is little prospect of improvement for the current week. Prices are so variable that it is really impossible to say anything about them. First-class Maids and Brides have been sold as low as $4 per hundred and the job lots go even below this figure every day.

Continuous warm and mostly bright weather has caused the development of an unusual amount of good flowers, which are sent to market every day; unfortunately the present demand is rather limited and a large proportion of the supply cannot be disposed of.

Several of our florists had decorations for the spring openings in the different dry goods stores on hand during the week; more of these are to follow soon. These openings are looked upon by a majority as a good thing for the florists, occurring at a time when business usually is rather slack, although the proprietors of these concerns are not inclined to lay out any more cash on these occasions than is absolutely necessary and are apt to hold the decorator down to the lowest possible figures, but it is better to accept a small profit in dull times than to get nothing.

W. Mott, the popular representative of H. A. Dreer Co., Philadelphia, was in town again. He has more friends in this neighborhood apparently than any other traveling agent who visits this city, for he always manages to book a goodly number of generous orders before he is ready to leave us.

K.

BOSTON.

Trade Conditions.

The general report is that business is very dull. The windows of the retail florists are gay with azaleas, acacias, hyacinths, tulips, etc. A fine display of the new carnation, Mrs. Thomas Lawson, in the window of Mr. Thomas Galvin seemed to attract much attention, judging by the crowds gathering in front of his store. W. E. Doyle's windows are always a center of attraction, being invariably arranged with much taste, some orchids being often used with telling effect. M. H. Norton and James Delay are making beautiful displays of flowering and decorative plants, most effectively arranged.

The wholesalers have to hustle to dispose of the large stocks received, as the cut is heavy at present, and there is not much likelihood of better prices till Easter.

Mass. Hort. Society.

At the weekly exhibition of the Massachusetts Horticultural Society the display was small but choice. Mr. W. W. Lunt, of Hingham, showed for the first time the new hybrid orchid, Laelio-Cattleya, Mrs. John D. Long. The cross is between Laelia elegans var. Warnerii and Cattleya superba var. splendens, and it was raised by Joseph G. Lunt. It was awarded the society's silver medal. The same gentleman showed a nicely grown plant of Dendrobium nobile var. Virginalis, a very beautiful variety.

Mr. Edward Butler, gardener to Mrs. Durant, showed a magnificent specimen of Dendrobium nobile over three feet in diameter and two feet nine inches high, and a mass of flowers. It was estimated that there were 1,000 blooms, all open. He also displayed a dozen vases of cut blooms of various varieties of dendrobes, lycastes, Lapageria rosa, etc., and was awarded a gratuity.

H. T. Clinkaberry, gardener for C. G. Roebling, Trenton, N. J., sent Epi-Cattleya Guatemalense, a very rare natural hybrid, but did not receive mention, as the flowers had been damaged in transit.

Mrs. P. D. Richards displayed a

small collection of native plants, including three varieties of sarracenias, mosses, etc., and there was a number of exhibits of vegetables.

Prof. E. A. Burt, of Middlebury College, Vermont, delivered a very able and interesting lecture on the resistance of plants to parasitic fungi, which was listened to with close attention.

Various Items.

Mr. S. J. Reuter, Westerly, R. I., is about commencing the construction of a half-dozen large new greenhouses.

Mr. A. Dimmock, representing F. Sander & Co., was a recent visitor.

Hilliard & Karlson, Exeter, N. H., are building two more new houses.

C. H. J.

JADOO.

This substitute for soil seems to be still gaining in popularity and usefulness in England, as seen by the below extract from the issue of the Tunbridge Wells Free Press for March 5, 1898. We have not space for the whole article, but in addition to what was seen at the famous nurseries of R. Veitch & Son, there were similar favorable reports from Dr. Wallace, the authority on lilies; Mr. Leonard Brown, the honorary secretary of the National Amateur Gardeners' Association; Mr. J. F. Alcock, of Berkhampsted, and several other commercial growers.

JADOO FIBRE.

Being in Exeter a few weeks ago, unexpected opportunity offered itself for pretty full enquiry into the nature and uses of Jadoo. We had often heard of the mysterious compound, and knew something of the advantages which were claimed for it; and having almost by accident lighted upon the offices of the Jadoo Company, we were able, by the courtesy of its enthusiastic secretary, to see for ourselves, in the nurseries of Messrs. R. Veitch and Son, the truly marvelous results of its use. But our first enquiry related to the nature of Jadoo, and, there being really nothing mysterious or secret about it, we immediately learned that the basis of it is peat-moss, which is inpregnated with soot, bone-meal, gypsum, and small quantities of phosphoric acid and potash, these plant-foods being used in such proportions as analysis and experience have shown to be most suitable. The ingredients are amalgamated by boiling, and a scientific process of fermentation so far fixes the chemical compound in the peat-moss that is given off very slowly and regularly, the root-action of any plant which is cultivated in it enabling that plant to take up just the amount it needs to induce its highest state of perfection. So completely is this the case that plants like mesembryanthemums, which will grow almost on a rubbish heap, thrive in Jadoo, and are not injured by the great amount of nourishment placed at their disposal, while on the other hand plants like chrysanthemums and roses, which want abundance of rich food, thrive equally well in it. From this explanation it will be seen that Jadoo is not a manure, nor is any particle of manure used in its manufacture, but it is essentially a cleanly and wholesome substitute for earth, and consequently the very thing for amateur gardeners, and, above all else, for indoor gardening.

The invention of Jadoo is entirely due to the ingenuity and patient investigation of Col. Halford Thompson, a Fellow of the Royal Horticultural Society, and one of the best-known horticulturists in the West of England. His experiments have extended over many years; and at the present time his greenhouses, conservatories, and gardens at Teignmouth are full of plants and trees grown entirely in Jadoo, peaches and pears, grapes and strawberries having been especially experimented upon, while almost every kind of stove and greenhouse plant has responded with exceeding kindliness to the treatment.

We had not the opportunity of seeing these particular experiments, but in the extensive nurseries of Messrs. R. Veitch and Son, at Exeter, we did see two stove-houses which were crowded with plants of many kinds grown in Jadoo alone. They included all the varieties of ornamental asparagus, very fine plants of tuberous begonias (of which some so grown have taken first prize at the Exeter Show), crotons and dracaenas (which seemed to be even richer than usual in color), several sorts of bouvardias (of which a fine single scarlet had been flowering continuously for six months), primulas of various kinds, orchids too numerous to make a note of, palms and pandanus (the well-known Veitchii among the latter), azaleas, camellias, and perhaps fifty other varieties of plants, besides hyacinths, iris, and other spring bulbs.

WASHINGTON.

Recently I took a run down to Alexandria and paid a visit to the establishment of Mr. J. Louis Loose, who has a model establishment there and on quite an extensive scale. His method of running the different departments is worthy of emulation; of each department, palms, roses, carnations, ferns, bulbous stuff, etc., he has an experienced man in charge and responsible for that department, there being no manager or foreman, the place of such a person being taken by himself. The result is plainly seen on entering the houses. One would judge the place to be a private rather than a commercial one with its cement walks, washed pots and such thorough cleanliness. With the exception of violets everything is well grown. Mr. Loose has determined to give up the cultivation of violets, at least for the present.

It would be difficult to praise one department more than another. The carnations in their way were exceedingly well grown, and the same might be said of the palms, roses, etc. He continues to grow the C. Testout, and finds it quite a favorite with his trade, also a bench of Saffron Yellow, which he finds profitable.

Mr. Loose is an artist, as any one visiting his beautiful store will testify. He has attracted more attention to his show window than any other store in the city. W. H. K.

PITTSBURG.

Three decorations of importance took place last week. Randolph & McClements had the Chamber of Commerce banquet for 200 guests, at the Duquesne Club. Beauties, Brunners, Harrisii and bougainvillea were used.

Gustav Ludwig had the decoration for the Prest. Union banquet at the Monongahela House.

The same evening Langhans & Co. had a unique decoration ball en masque at the Concordia Club. Clusters of weird false faces were intertwined with wild smilax, and festoons of laurel embellished the walls and ceilings; 300 boutonnieres of pink roses were used. Harrisii and red carnations in vases were used as the table decorations.

E. C. Ludwig made a fine display of Brunners; they are the first ones to appear in this market. L.

TITUSVILLE, PA.

Florist Bay on Friday distributed 1,000 choice chrysanthemum plants among the pupils of the public schools. It is Mr. Bay's intention to hold a show next fall for the exhibition of blossoms from the plants given out as above stated and to award a number of prizes to the pupils who make the best showing. Last year this popular florist gave away a large number of the plants and at the show held at the Main street school a very fine collection of the flowers was exhibited. The interest and rivalry displayed by the contestants at that time will doubtless result in renewed efforts to excel in the cultivation of the plants and a better exhibition of flowers this season.—Titusville Herald, March 14.

SOCIETY OF AMERICAN FLORISTS AND ORNAMENTAL HORTICULTURISTS.

[OFFICERS.]

Pres., Wm. F. Gude, Washington, D. C.; Vice-Pres., A. Donaghue, Omaha, Neb.; Sec. Wm. J. Stewart, 67 Bromfield St., Boston, Mass.; Treas., H. B. Beatty, Oil City, Pa.

NEXT MEETING.

The fourteenth annual convention will be held at Omaha, Neb., August 16, 17, 18 and 19, 1898.

The Trans-Mississippi and International Exposition will be held in Omaha, June to October, 1898. F. W. TAYLOR, Supt. of Horticulture.

CHATTANOOGA, TENN.—John Karsten is much encouraged by a steady increase in patronage. His attractive place, stocked with well grown stuff, and his genial personality, merit recognition.

ELMIRA, N. Y.—Grove P. Rawson reports a heavy advance sale for violet runners. His stock is in prime condition. The new mums also are taking well. Hoffman Bros. are doing a rushing business in decorations.

RED ROCK, PA.—Fire did $300 worth of damage to the greenhouses of E. B. Sage, the florist, March 13. No insurance.

Subscribers who are large buyers of trade supplies and who would like a larger interest than the one provided in our subscription offer are requested to correspond with us. Florists' Publishing Co., 530 to 535 Caxton Building, Chicago : : : : : : :

WANT ADVERTISEMENTS.

A FIRST-CLASS MAN is now open to engagement fully competent in every respect; expert grower of both plants and cut flowers; wants an opportunity to better himself; no object to change unless there is an opportunity for him to show his abilities on a scale that will make his services worth at least $75 a month. Address S. D., care Florists' Review, Chicago.

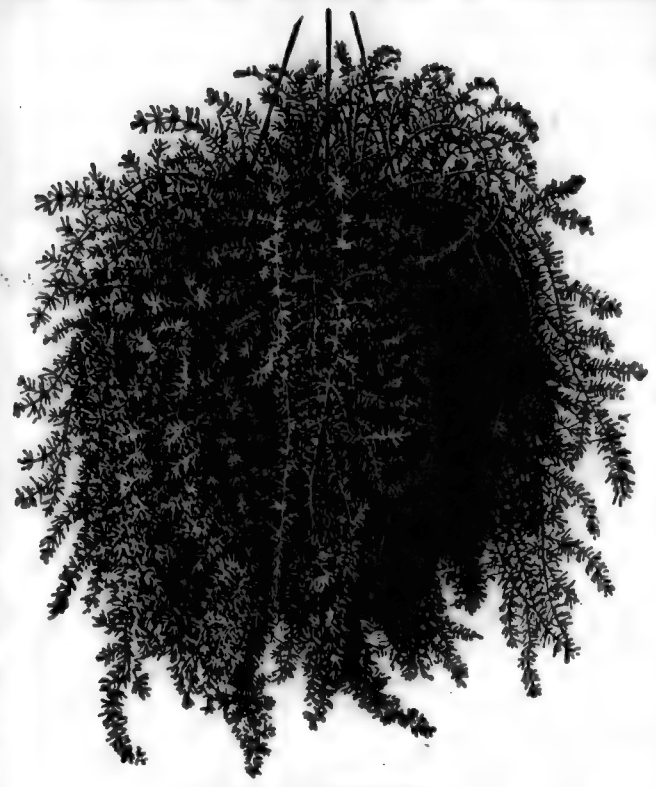
VASE FOR THE CEMETERY.

The Clara Cemetery Vase

Patent applied for by Mrs. C. W. Pike.

A Receptacle for Flowers, long needed for the Cemetery.

The **CLARA VASE** for use at the Cemetery is a handsome as well as one of the most useful articles ever placed on the market. It is absolutely a new thing and takes the place of all the old tin cans, bottles and various old truck that are usually found in the cemetery for holding flowers, and prove such a disgrace where everything else is beautiful and ornamental. It is composed of solid glass and stands about twelve inches high. The lower end is sharp-pointed so it can be imbedded about six inches in the ground and stand firm. It will hold sufficient water to keep the flowers fresh and sweet, and will accommodate flowers with long as well as short stems. The vase is bell shaped and the top has a diameter of about five inches.



The vase is sold at a very low price and is within the reach of all classes. It is very strong and well made and can not be broken by rough handling.

Prices, delivered to railroad or express companies in Chicago:

One Dozen, ...	$3.50
Three Dozen, at	3.25
Five Dozen, at	3.00

Samples sent on receipt of fifty cents (50c.) each.

These vases will retail in the market for from 50c to 75c each, thereby giving the dealer a profit of over one hundred per cent on his investment.

ASPARAGUS SPRENGERII.

Good Things worthy of all Florists' Notice.

ASPARAGUS SPRENGERII PLANTS.

HUNT'S REVIEW OF THE CHICAGO MARKET.

The market has been uniformly dull, with scarcely an exception during the entire past week.

Carnations and smilax are still somewhat short of demand—smilax especially so—being scarce every day, while Saturday and Monday are about the only days when the carnation scarcity is felt to any extent.

Roses have been and are yet plenty, not merely plenty, but in over supply. Demand, both shipping and local, is light, and in consequence prices, at which the bulk of ordinary stock move, are lower than at any time so far during Lent—(this season).

Things have been very uneventful—a sort of monotonous drag, noticeable everywhere—with only semi-occasional spurts.

Violets have sold quite readily at fair to good prices.

Spring bulb stuff from southern shipping points has come and sufficiently heavy to cut some little figure, as street venders, to some extent, have deserted roses for it.

Several large growers of Harrisii are backward with their Easter stock, and in spite of all efforts to force them, are afraid that they will fail to make connections. The chances favor a short market on them this Easter.

SUBSCRIBE for The Florists' Review if you have not already done so, and receive a certificate entitling you to the earnings on one dollar's worth of stock in the Florists' Publishing Company.

WEST CHARLESTON, O.—Joseph R. White, the nurseryman, committed suicide March 13. No cause is assigned for the act.

GERANIUMS.—Grand Bedders and New. 40 var. $1.30 per 100, $10.00 per 1000. **Alternanthera.**—P. Major and Yellow, fine little plants. **Coleus.**—30 finest var., Sage, Grandiflora and Bonfire, 2 best. **Petunia.**—Ruffled Giants, 85c per 100, $5.00 per 1000. **Pansies.**—Best, Giant and Bugnot in bud, $6.00 per 1000. Small, 60c per 100, $3.00 per 1000; 100 rates by mail, 1000 rates by express, any quantity. Send for my list.

CLEVELAND.

Lent still casts its shadow over the florists of Cleveland, but for some reason it does not seem to be a very heavy one this year. Of course, social matters are practically at a standstill, but ordinary matters, the home use of flowers, transient trade and funerals all combine to save us from ruinous stagnation. In fact, while there are flowers going to waste, there is nothing that approaches a glut as yet, and lower prices on everything help to move it off in one way and another. The funeral of one of the members of the city council last Sunday also called for a good deal of stock of various kinds, the orders being pretty well distributed among the various florists.

Messrs. Graham and Cushman returned from Washington last Friday, where they had been in attendance at the executive committee meeting. Many matters of interest to the trade were discussed. They also had a very pleasant time socially in Washington, and met many men of floricultural wisdom from various eastern points. Coming back, they visited Schenley Park, Pittsburg, and under the guidance of Mr. Falconer, saw all that was to be seen—which is a great deal, according to what we hear. The palms and ferns of all sorts were very fine, and a new feature in the form of a house devoted solely to economic plants gives promise of being a very taking feature as soon as it has had time enough to grow and develop.

Easter plants for the Easter display were coming along finely. Hydrangeas in large sizes in quantity, big genistas in good shape, cinerarias of all colors, azaleas and bulb stock were to be seen in such quantities as must make a wonderful exhibit at Easter time.

Some further travel through various greenhouses since the last report tends to confirm the impressions in regard to Easter stock received through former visits. Ever since then we have been having steady, warm, sunny weather, which has advanced stock wonderfully, as well as having in many cases wrought considerable improvement in the quality. Many lilies that formerly seemed late have a fair chance now. On the other hand, some azaleas are going to be very difficult to hold, unless the weather should change very much from what we have been having. NEMO.

WASHINGTON, D. C. — Madame Chatenay Rose, grown by the American Rose Co., distanced all competitors and was used by Mr. Pfister at the White House as the table decoration for the banquet given by President McKinley to Prince Albert of Belgium. The rose as grown by this firm would hardly be recognized as the original Chatenay. In fact, it is said to partake now of the character of a sport.

NATHAN SMITH & SON,

WHOLESALE FLORISTS

SPECIALTIES: **ADRIAN, MICH.**

Chrysanthemums, Carnations and Violets.

Correspondence solicited.

Always mention the Florists' Review when writing advertisers.

GRAND RAPIDS, MICH.

Carnation Exhibitit of Club.

The Grand Rapids Florists' Club held a carnation meeting at Crabb & Hunter's. Previous to the meeting the greenhouses were thoroughly inspected and much favorable comment made on the quality of their violets, which all declared were the finest they ever saw and could not be improved on. The rest of their stock was in keeping with their violets.

This meeting marks an epoch in the history of carnation growing in this locality, for in it was inaugurated a movement to improve the quality of flowers, even at the expense of quantity, and strive to secure a proper price for this higher grade of flowers, both in the local and shipping trade. Henry Smith and George F. Crabb, the committee appointed to secure exhibits for the meeting, met with good success, and the following firms helped to materially advance the cause of the divine flower: E. G. Hill, Richmond, Ind., staged some immense blooms of Flora Hill and Jubilee, also Painted Lady, Psyche and their seedlings, America and Scarlet Queen.

Fred Dorner & Sons Co., Lafayette, Ind., Gold Nugget, winner of the Cottage Garden's silver cup, White Cloud and immense blooms of Mrs. G. M. Bradt.

Wm. Swayne, Kennett Square, Pa., sent his dusky Empress in fine shape; Dan'l B. Long, Buffalo, N. Y., his famous Genesee; C. F. Baker, Utica, N. Y., Red Jacket and Oneida; R. Witterstaetter, Cincinnati, O., Evelina, queen of the Chicago show; Geo. Hancock, Grand Haven, Fire Fly and Gold Coin, also a vase of mixed seedlings.

The local florists put up a fine display, which added much to the importance of the meeting, as contrasts and comparisons could be made with the higher grades of flowers.

N. B. Stover Floral Co. staged fine Spray and Scotts; Henry Smith showed Flora Hill, Jubilee Armazindy, Mrs. McBurney, Duhme and Morello; Alfred Hannah staged Flora Hill, Scott, Jubilee and Dazzle; F. A. Chapman a vase of Victor.

Crabb and Hunter exhibited a vase of mixed seedlings. including their new pink, Irene, also Flora Hill, Jubilee, Duhme, Lily Dean, Scott, Morello, Mrs. McBurney, Dazzle, Ivory and Mayor Pingree.

Discussion.

The meeting was called to order by Pres. N. B. Stover. James Hancock, of Grand Haven, gave an interesting talk of his experience with new carnations, which, together with the discussion which followed, drew out the following conclusions:

In order to ascertain what varieties will succeed best with you, it is necessary to try a few of all; you will certainly find some with which you will

(Concluded page 706.)

THE ELIZABETH NURSERY CO.,
ELIZABETH, N. J

be successful, then discard the rest; as soil, climatic differences, different methods of cultivation, all enter into the degree of success or failure attained. A variety that will do well with one firm is or rather may be a failure with another. Crabb & Hunter are the only ones round Grand Rapids who can make a success in growing Ivory; with them the flowers are large, with strong stem, and as free as Scott; it is the white for them to grow. Again, Chas. Chadwick has his best success with McGowan, which variety is now pretty well discarded, except a stray batch here and there, grown more for stock than the flowers. The Stover Floral Co. are apparently the last remaining champions of the once indispensable Silver Spray. In this section, its days are numbered; we can no longer grow it as of yore, or as Stover grows it. Henry Smith grows Lamborn extensively and well, and to him it is his best white. His success is so marked that others will try it next winter. The chief objection is its very weak neck. Paul Goebel apparently has come nearest perfection in cultural methods to the requirements of Flora Hill. Alfred Hannah says he has a white seedling that may not take a back seat for any variety. He is, however, very partial to Flora Hill and will plant largely of that variety next year.

Of the three new whites some thought Genesee might prove the most profitable, the flower being medium in size and might produce flowers easier and more abundantly than the others. From the description of the Chicago show, given by the committee, all were inclined to favor White Cloud and Evelina as the best up-to-date whites, and all three will be given a thorough trial; as will all the varieties exhibited, particularly Gold Nugget, it being a better shade of yellow than Mayor Pingree.

A vote of thanks is extended to Messrs. Hill, Dorner, Swayne, Witterstaetter, Baker, Long and Hancock for their generous contributions to the meeting.

It was decided that twenty-five cents per dozen, the present prevailing price, was too cheap at which to sell a higher grade of flowers, and an effort will be made to advance the price of certain varieties to 50 and 75 cents per dozen next winter, according to quality; failing to get that price, to make the growing of such flowers pay, they will be shipped to where better prices prevail. The progress and evolution of the high grade carnation was compared to the chrysanthemum of five years ago.

Banquet.

This most important meeting ever held by the club was followed by the usual banquet (a vote of thanks to Mr. and Mrs. Crabb), and a continued social discussion of the merits of the various seedlings before breaking up.

GEO. F. CRABB.

Galax Leaf.

JOSEPH HEACOCK,

Wyncote, Philadelphia, Pa.

AN UNPARALLELED SUBSCRIPTION OFFER.

EVERY one to whom this issue of the FLORISTS' REVIEW is addressed, and who fills out, signs and returns the accompanying subscription blank, accompanied by $1.00, within 30 days from date, will receive not only the FLORISTS' REVIEW for one year but also a certificate entitling him to the earnings on one-tenth of a share of stock in the company formed to publish the paper. The shares will be of a par value of $10.00 each.

Why do we make such an unparalleled offer? It is very simple.

You will have an interest in the success of the paper.

You will see that you can buy everything that you want to just as good advantage from advertisers in the FLORISTS' REVIEW as elsewhere and at the same time benefit yourself by increasing the earning power of your certificate.

This mutual arrangement cannot fail to bring to the paper a heavy advertising patronage, and as a result the stock represented by your certificate will earn good dividends.

And the more you buy of advertisers in the FLORISTS' REVIEW (always mentioning the paper) the larger your dividends will be.

You will get a better paper than has yet been published in this field, and a share of its earnings. Please let us hear from you by early mail.

FLORISTS' PUBLISHING COMPANY,

530-535 Caxton Building, - - - CHICAGO, ILL.

AZALEAS FOR EASTER

We are carrying in stock an immense quantity of Azaleas for Easter forcing; the plants are in good condition and finely set with buds; the varieties we offer are only the best commercial sorts. As these plants can be more safely shipped when in bud, we wish to impress the importance of early orders. We will not be responsible for injuries arising from late shipments when the buds are developed.

	Size in Diam.	Per Doz.	Per 100
5-in. pots, nice bushy crowns	10 to 12	$5.00	$40.00
6-in. " " " "	12 to 15	9.00	70.00

...DECORATIVE PLANTS FOR EASTER...

We enumerate below only such varieties and sizes as are especially suited for decorative purposes. For a full line of this class of stock, see our Quarterly Wholesale Price List, issued March 15th.

Standard or Tree-Shaped Bays.

THE REGAN ... PRINTING HOUSE ...

Nursery Seed & Florists' Catalogues

87-91 Plymouth Place, Chicago.

UTICA, N. Y.

When Fred C. Baker sent his two "Indians" flying across the country to Chicago in response to an urgent message from a pushing agent he supposed they were to be placed on private view, perhaps for "gentlemen only," but instead they were exposed to the critical gaze of the carnation experts, and in consequence of not being pruned for exhibition failed to score. So Red Jacket, with its sweet and lovely consort Oneida, instead of conveying a favorable impression as they do in their habitat, were given the cold hand, which, however, will doubtless become warmer as their merits and qualities are better known. From my observation made at this time both are right up to date, and should prove profitable investments, and yet they may do no better elsewhere than many of their predecessors that have been launched upon the trade with a greater flourish of trumpets.

There never will be entire success until the soil accompanies the plants; there's everything in the soil. Bouton d'Or has been in crop all winter; it's a splendid thing. These three varieties are in heavy crop for Easter.

Roses are in capital shape. I noticed in one house of Bridesmaid, where a steam pipe ran overhead half the length of the house, the plants were much freer and were yielding more blooms. Plants were all put in at same date and of equal strength, which reasons that circulation of heat overhead is appreciated.

Mr. Baker is an enthusiast on ferns, and considers Nephrolepis cordata compacta the finest of the species for the retailer.

C. F. Seitzer is throwing out part of his elegant Campbells to make room for spring stock. He has a fine lot of carnation, Flora Hill, and a beautiful stock of Zonale geraniums.

W. M.

A ST. PATRICK'S DAY VISITOR.

The "agent" of Messrs. Ellis & Pollworth, Milwaukee, called on us March 17, and was very appropriately attired in a green suit. But his request to "hang me up" surprised us. "Our Agent" is the title of the catalogue of this enterprising firm, and the announcement on the green cover that "it speaks for itself" is borne out by the contents. The many fine half tone engravings giving accurate views of the stock in their greenhouses are admirable, and the forty-eight pages of descriptive matter are all well illustrated. Apparently nothing in the way of florists' supplies has been omitted from the book, and "Our Agent" ought to send in many good orders.

SUBSCRIBERS are reminded that they will enhance the earning power of their certificates by buying their trade supplies of the advertisers in The Florists' Review. Buy to best advantage always, but other things being equal give the preference to those who advertise in the paper in which you have an interest.

Grand New Violet "La France."

STRONG VIGOROUS GROWER.
EXTRA FREE FLOWERING.
RICHEST COLOR.

Of the many new Violets introduced in the past few years this, the latest introduction of the foremost French specialist, is unquestionably the **BEST.** It has been thoroughly tested by Mr. Supiot, the Violet expert, who pronounces it "perfect," and flowers which we have exhibited during the past few weeks have been much admired. In vigor of growth, freedom of bloom, and in size and coloring it is superior to all existing sorts, and will soon supercede them. Only a limited stock will be offered this season, and orders will be filled in strict rotation

Price, $1.25 per dozen; $10.00 per 100.

R. VINCENT, Jr. & SON, White Marsh, Md.

TORONTO, ONT.

Your Toronto correspondent, the "only" E., in his departure for the West, takes with him the best wishes of his confreres and a desire for a speedy return. Doubtless he will have much to relate to the boys at the little weekly gathering, which takes place at St. Lawrence market, where can be found Grainger Bros., of dahlia fame; Manton Bros., of practical and reportorial repute, and Frank Duffort, who, in addition to his skill in producing what some others fail in, is, I believe, mayor of his town. Simmers Bros. and Steele, Briggs Seed Co., both famed seed houses, situated near by, are in the whirlpool of spring rush, owing to the advanced season.

J. H. Dunlop makes a fine display in both of his stores, particularly the one down town. He is quite metropolitan.

C. J. Tidy finds the conservatory attached to his handsome store a capital house in which to carry stock, both utility and adornment being combined in this elegant structure.

W. Tidy is preparing for the spring rush in addition to carrying the well grown Easter stock at his Wellesley store for the increasing demand in that select neighborhood. W. M.

LOUISVILLE, KY.

Our spring flower show will have to be postponed if not entirely dropped on account of the manager of the hall having given our dates to other parties.

Quite a lot of building will be done this summer. Mr. Jacob Schulz will build one new house 152 feet long and rebuild two, one 20x152 and one 10x 152. He is going to make one house 30x152 out of these. Mr. J. E. Marret will rebuild three houses 20x130 feet. Mr. C. H. Kunzman is going to move his greenhouses to a larger lot and will build several new houses. J. Coenen & Co. will also rebuild three houses 20x80 and two new houses 20x80.

Business has been very slow for the last two weeks. We are being overrun by bulb sellers from Holland just now. Hyacinth bulbs are higher than last year, tulips are lower. Ky.

RALEIGH, N. C.—Henry Steinmetz has a well equipped place, and while the season has been very unfavorable for out-door stock, he will have a capital supply for Easter. Mr. S. raises large quantities of bedding stock.

HORNELLSVILLE, N. Y.—W. A. Wettlin reports a book full of orders for Easter, and has a capital stock with which to supply his customers. Carl Sackmann, formerly with H. A. Dreer, has charge here, and shows evidence of his cultural skill.

IF YOU are not already a subscriber be sure to read our unparalleled subscription offer in this issue.

NEW CARNATIONS

THE COTTAGE GARDENS SET. Price, $3 per doz.; $10 per 100; $75 per 1000.

NEW YORK—A free blooming, bright cerise pink, that is very popular on the New York market. Stock now limited.

BON TON—A bright scarlet on stiff stems; very fragrant; vigorous, healthy habit. Needs no stakes.

WHITE CLOUD—A large free blooming white, on very long, very strong stems. One of the most profitable whites in existence.

MR. JAMES DEAN—A pure clean pink, delicate and chaste; large bloom on long wiry stem; constant bloomer. The most popular pink carnation on the New York market.

JOHN YOUNG—A fine fringed snow white, on long, stiff, wiry stem. Habit much like Scott. Vigorous grower and fine bloomer. Excellent keeper and shipper.

GOLD NUGGET—A free blooming, large deep yellow, lightly marked with scarlet; on long, stiff stem. Free, constant bloomer. The best yellow out. Stock limited.

MRS. FRANCES JOOST—A pure clear pink. Scott habit, long stiff stem, profuse bloomer, vigorous grower, very promising. A few fine plants from 2-inch pots at $10 per 100.

MRS. G. M. BRADT—Large massive variegated flower, good stem, healthy grower and constant bloomer. The most popular and profitable variegated carnation out. Stock limited. $6 per 100.

LILY DEAN—Large handsome snow white flower, beautifully penciled. Nothing finer when grown cool; fine plants, $5 per 100 from soil.

STORM KING—Magnificent snow white bloom on a grand stem. Nothing can be finer when grown on rich, loamy soil and properly irrigated. From 2-inch pots $2 per 100.

MAYOR PINGREE—Splendid large yellow bloom on a grand stem 30 inches long. An immense flower. A prize winner at all the shows. Splendid keeper. $5 per 100; $40 per 1000.

C. A. DANA—A pure clear pink, medium to large bloom, on strong, wiry stem. Profuse bloomer, strong grower, and a fine keeper. $4 per 100; $35 per 1000.

VICTOR—A deep pink sport from Daybreak; rather stronger grower than its parent. $4 per 100.

LIZZIE McGOWAN—WM. SCOTT—A fine lot of these two well-known varieties at $1.50 per 100; $12 per 1000.

THE COTTAGE GARDENS, C. W. WARD, Manager, Queens, N. Y.

Office: 272 Boylston St., - **Boston, Mass.**

We Open it for Two

CHICAGO, March 4, 1898.

MR. EDWARD SWAYNE, WAWASET, PA.

DEAR SIR:—Why not give us a chance to come in on this Jack pot? It certainly would not prove a Frost if you did. Respectfully,

FLORISTS' PUB. CO.

JACK FROST

is perhaps the largest white carnation in cultivation, having won this distinction in open competition at Philadelphia, April, '97, Flora Hill being a competitor . . . . . .

Full description sent on application. Stock now ready, $10.00 per 100; $80.00 per 1000 . . . . . .

Can also furnish

EMPRESS (Wm. Swayne),

FIREFLY (Hancock),

and all of W. R. Shelmire's new ones.

EDWARD SWAYNE, Wawaset, Pa.

WAWASET, PA., March 9, 1898.

FLORISTS' PUB. CO., CHICAGO.

GENTLEMEN:—You can't come in without the chips. If you will publish your letter adjacent to my adv. we will try two insertions. Yours truly,

EDW. SWAYNE.

GERANIUMS.

Extra strong and robust plants 3½ inch pots. pots. 3.75

Double Grant, Nutt and finest varieties to be had. $3.50 per 100, extras added. This offer until April 1 only. Must go into 4-inch pots. Adams and U. S. Express. Cash or one-half cash and balance C. O. D.

JOHN F. RUPP, Shiremanstown, Pa.

SPRINGFIELD, MASS.

C. R. Miller made a fine exhibit of geraniums in bloom from Linwood Morgan's conservatories in Longmeadow, last Tuesday, and they were a very fine lot, most of this and last year's importations. They were sold after the exhibit at good prices. This house carries some fine roses, both hybrid and teas, carnations and bulb stuff. Bulb stuff sells well this season and is exceptionally good. Business has been good here all the week. This house is selling violets in 3-inch pots, all in bloom, at 25 cents each, and they sell at sight.

Aitken & Son are busy, as usual. They handle daily 2,000 violets, which are very fine.

The Sweet Pea exhibit will be held in this city July 20 and 21. Prizes will be announced later. H. G.

KANSAS CITY, MO.

Trade has been fair, but nothing large going on. Getting ready for Easter. Harrisii is going to be scarce, the disease playing havoc with lots of growers here.

Now for drummers—heavens! two and three a day, all well groomed and giving unmistakable evidence of prosperous times, but the curse of our business is too many drummers giving us too much credit. Easy to order and stock up, but to pay prompt is another story, but war with Spain will probably adjust things, if not the Klondike. S.

SAN FRANCISCO, CAL.—The early fruit section of California, from where most of the early cherries, apricots and peaches are sent east in April and May, was visited by a disastrous frost March 17. The loss will reach into the millions.

NEW CARNATION, "EMPRESS"

The largest bright-rich Crimson yet introduced. Price, $10 per 100.

Geo. A. Rackham, 880 Van Dyke Av., Detroit, Mich.
Wholesale grower of Carnations and Small Ferns.

ST. LOUIS.

Supply and Demand.

Stock is decidedly more plenty, and although as yet no actual glut, except in violets and bulb stock. The down town corners are lined with fakirs. Some of them are quite heavy buyers, and as a rule are given a lot of stuff not otherwise salable. There is, of course, more or less cutting of prices under these conditions among the down town stores.

The regular quotations on first-class stock in roses, such as Brides, Bridesmaids, Meteors and Carnots, are from $4 to $6, and the smaller varieties, Perles and Woottons, are $2 and $3; job lots at thousand rates are going at much less. Beauties, really first-class stock, are very scarce, and bring $4 per dozen; good short-stemmed Beauties are offered at from 60 cents to $2 per dozen.

The supply of carnations is heavy just at present. All varieties go at from $1.50 to $2, some extra fine fancy bringing $3. The demand for this flower has been steady, and at present very heavy, but there is no great accumulation of surplus stock.

Bulbous stock is still very plentiful, with price away down. Harrisii and callas are selling at $6 and $8; Romans, $1 and $2; tulips, $2 and $3; daffodils, $2; valley, $2; Dutch hyacinths, $2 and $3; freesia, $1; sweet peas, very fine, $1.50. Violets, California, 25 and 30 cents; common, single, 8 cents; southern stock is unsalable in this market just now. Smilax plentiful at 15 cents; asparagus, 35 and 50 cents per string.

Personals.

Prof. Wm. Trelease, of the Missouri Botanical Garden, will on May 1 sail for Europe, to visit the different botanical gardens of the old world. The professor will be gone about three months.

Mr. Wm. O. Fuller, of Henderson, Ky., was in the city a few days last week.

Mr. George M. Kellogg, of Pleasant Hill, Mo., was in the city for a day, on his return trip from Washington, D. C., where he attended the meeting of the S. A. F. A. O. H. Mr. K. reports that he had a great time, and will make strenuous efforts to make the next meeting at Omaha a great success.

Fred Foster is no longer connected with the Etoile Floral Company, at 921 Olive street, of which he was its manager, and Miss Todd, formerly of the Chandler Floral Company, will take his place.

Frank Bucksadt, for a long time doing business at 2602 Olive street, has retired from business.

Mrs. C. H. Peirce. Merry Christmas.

Two sterling Chrysanthemums, which every florist must have among his collection for commercial and show purposes. They are worthy of the highest praise, and we do not hesitate to recommend them to every florist. Order now. We will have a large stock ready April 1st, and can fill all orders with satisfactory plants.

Mrs. C. H. Peirce—A large yellow flower of good round form and best substance. Beautiful foliage, sturdy, short jointed growth, with foliage up to the flower. An excellent commercial variety. Take first bud. Height, 3½ ft. At its best Nov. 6th to 25th.

Merry Christmas—The latest Chrysanthemum in cultivation, making it the only Chrysanthemum that can be grown successfully for Christmas flowers; needs no extra care; height, 4½ ft. Good stiff stem, large flowers and great substance; of purest white, and full to center. Take terminal bud. At its best Dec. 20 to Jan. 1st.

35c each. $3.50 per doz. $25 per 100.

SOLD BY WHOLESALE SEEDSMEN.

What are the Advantages of using Jadoo Fibre and... Jadoo Liquid ?

Here are some that Leading Growers and Florists have already found out:

YOU CAN USE POTS TWO SIZES SMALLER
YOU CAN SHIP PLANTS WITHOUT POTS
EVERY SEED WILL GERMINATE
EVERY CUTTING WILL ROOT
ROOT ACTION WILL BE STRONGER

FLOWERING WILL BE MORE PROFUSE
FOLIAGE WILL BE BETTER IN COLOR
TRANSPLANTING REQUIRED ONLY HALF AS OFTEN
NO CHECK AFTER TRANSPLANTING

Can You Afford to Grow Plants Without Jadoo Fibre ...or Jadoo Liquid ?

Are These Advantages Appreciated by the Trade ?

On January 1st, 1898, twelve Seedsmen and Dealers handled Jadoo Fibre and Jadoo Liquid. Today they are handled by the following 55 houses:

WRITE FOR OUR CATALOGUE.

The American Jadoo Co.

817 Fairmount Ave., Philadelphia, Pa.

BRAMPTON, ONT.

Harry Dale is, I believe, the first grower to adopt the "mechanical stoker," and for the benefit of those who have not seen this latest piece of mechanism a brief description may be in order.

The two batteries of sixteen boilers are arranged opposite each other in ranges of eight. The coal is fed into a kind of hopper from which it is gradually placed on the fire by a revolving, screw-shaped roller; at the same time the ashes are sifted by means of a sliding grate, so that the fire is never raked nor doors opened. A lever is used to dump clinkers, and the only thing incomplete is the drawing of ashes from under the grate. This has already proven a saver both of fuel, getting as good returns from soft coal slacks as did formerly from hard coal, and labor. (Fuller details on application.)

The motive power is an engine of five horse power, which, however, is sufficiently powerful to drive an additional battery of eight boilers, which are being built to furnish heat for two houses each 600x19, open at gutters, and one 200x18, now in course of erection. Mr. Dale's intention is to surpass himself, if possible, in raising the magnificent stock, particularly of roses, for which he has helped make the Dominion famous. His fame has extended to "old Hingland," and deservedly so.

Carnations are also in it. Edna Craig has been the most profitable variety this season, bringing $4 all winter. Nivea is also very satisfactory. While the flower is not so large as Flora Hill, it is more floriferous. The new Cerise Queen (Breitmeyer) shows up finely. Mr. Dale thinks very favorably of this variety. I noted the propagating houses were filled with healthy stock. Corrugated iron is used in place of slate for benches of propagating houses and answers admirably.

I should not be surprised to find on my next visit an automatic grower, and may be a ditto drummer to follow.

W. M.

A SUBSCRIPTION to The Florists' Review is a good investment from every point of view. No other investment will make you such good returns.

WE HAVE PLEASURE IN OFFERING TO THE TRADE THIS SEASON FOR THE FIRST TIME ONE OF

The Finest Novelties in Chrysanthemums

EVER SENT OUT

...MRS. O. P. BASSETT...

It will only be necessary for us to state that **This is a Yellow Mrs. Henry Robinson**

to ensure for it a large sale. It is a sport from Mrs. Henry Robinson, with which variety it is identical in every respect except color, being a delicate primrose yellow, deepening toward the center of the flower. It has been thoroughly tested, and is a novelty of sterling merit. One of the most eminent eastern growers who has tested it states that it is one of the best things in Chrysanthemums sent out in some time. Every Chrysanthemum grower will want it. **A Yellow Mrs. Henry Robinson** will be a money-maker, and a fine exhibition variety as well. Plants now ready for delivery. We have also fine stocks of the other finer introductions of the year—**FRANK HARDY, MRS. H. WEEKS, AUSTRALIAN GOLD.**

Price, $3.00 per dozen; $20.00 per 100.

Wm. H. Chadwick, $6 per doz. The Yellow Fellow, $3 per doz. Pennsylvania, Autumn Glory, Solar Queen, Black Hawk, Quito, Thornden, $5 per doz.; $35 per 100. Boundless Snow, Mrs. C. H. Peirce, Miss Gladys Vanderbilt, $3.50 per doz.; $25 per 100.

We offer also all the best of the **Novelties for 1897,** and the **Best Standard Sorts.** Send for our wholesale list and large descriptive catalogue, giving full list of varieties and prices. We have a very large and fine lot of Novelties in Cannas for 1898, also best and latest introductions in Carnations, Dahlias, Strong Field-grown Roses and other Hardy Plants, a large and fine collection of Palms and other Decorative Plants, etc., etc.

We will be pleased to send our wholesale list and descriptive catalogue to any one who may not have received them.

PITTSBURG CLAY MFG. CO., - New Brighton, Pa.

Use Economy and Make Your Own Pots

THE COW MANURE POT is the best in the world for young plants. For bedding and sending of plants it is the best thing ever invented. The cow manure forces the plant and makes it healthier. You do not need to disturb the roots in getting them out as you do in the clay pots. It is especially recommended for the sending of plants, as the plant does not have to be taken out of pot. For bedding all you have to do is to squeeze the bottom of pot and set out in bed. It never stays the plant, it holds the moisture better, especially if you have a dry summer. The pots stand watering in greenhouse and hotbed. Every gardener needs one of these machines. **Single machine, 2-in. pots, $4.50. Double machine, 2 and 3-in. pots, $5.** Machine weighs about 5 pounds.

BALTIMORE.

Market Conditions.

Little new can be said of the retail business this week, except that it is still holding its own, and all reports are exceptionally encouraging for a continuance of same. Funeral work was largely in demand, owing to the death of several prominent citizens. We are having veritable summer weather, with a bountiful supply of good stuff. The wholesale houses are well stocked and prices have dropped considerably.

A continuance of this warm weather will produce a scarcity of good violets for Easter, as they are now blooming to excess. One grower alone could pick 50,000 strictly first-class blooms, from 100 sash, if he could find a market for them.

Gardeners' Club.

Monday evening, March 14, the Gardeners' Club elected the following officers to serve for the ensuing year: President, Edwin A. Seidewitz; vice-president, Chas. M. Wagner; recording secretary, Chas. F. Feast; financial secretary, W. Paul Binder; treasurer, Wm. B. Sands; librarian, Jno. L. Wagner.

A banquet followed at the Hotel Lafayette. Fifty-nine members subscribed, making one of the largest turnouts in the history of the club. After a most sumptuous repast our newly-elected president was prevailed upon to make a few remarks befitting the occasion. He said in part:

"It is often said, 'a man who loves flowers cannot be a bad man.' If this be true, we gardeners must be all good, for show me a man who has selected our vocation from a mere mercenary purpose, and who has a want of enthusiasm upon beholding a gem of Flora's Kingdom, and I'll show you a man who is dangerous and unworthy of confidence and respect. If we but followed the beautiful lessons taught by nature, there would be no strife among those who cultivate the flower, and our vocation would be the instrument to bind us closer together than the obligations of any fraternal organization."

The club gratefully acknowledged the receipt of a large bunch of Empress carnations, sent by Mr. Wm. Swayne, of Kennett Square, Pa.; also a fine vase of Alba Superba from Mr. Jno. Burton, of Chestnut Hill, Philadelphia.

Genial Mr. Burt Eddy, of Vaughan's seed store, has been in town several days, and reports the seed business "booming." C. F. F.

ONE DOLLAR will bring you The Florists' Review for a year, and at the same time entitle you to the earnings on one dollar's worth of stock in the Florists' Publishing Co. You will never be able to make a more profitable investment of a similar amount.

To Succeed in Gardening You Must Have First-Rate Seed.

Do you know what a first-rate seed is? It is bred up, just as a horse, or cow, or dog, or hen is. Vegetables and flowers are poor in their natural state; they are fair in their usual state; they are rich in the proper seedsman's proving-ground. And the richer they are the more unstable they are; they tend back, as water runs down hill. A first-rate vegetable or flower Seed goes back to a lower grade as soon as it ceases to feel the seedsman's care. This care is not cultivation; it is sorting out and breeding up.

The wise gardener trusts no seedsman's Seeds in the next generation. He gathers no Seeds himself; he buys of his seedsman every year, and so does his wife.

You see, the farmer's and gardener's first anxiety is, not plows and harrows, but Seeds. Any plow will plow; any harrow will harrow; but first-rate Seeds he must have, or fail in his crops.

Burpee's Seeds Grow.

Do you plant for PROFIT?

If so, you should write for **BURPEE'S BLUE LIST.** which gives **wholesale prices** for Market Gardeners, Florists and Farmers' Clubs. ☞In writing for this list be sure to ask also for our complete descriptive catalogue—THE FARM ANNUAL FOR 1898—if you have not already received a copy.

CANADA TO BAR AMERICAN NURSERY STOCK.

A bill has been introduced in the Canadian House of Commons by the Minister of Agriculture to prohibit the importation of American nursery stock on account of the San Jose scale. The bill is also directed against Japan and Hawaii. The minister held that the bill was necessary to protect the interests of Canadian nurserymen. The rules of the house were suspended to hurry the passage of the bill so as to make it impossible for American nurserymen to rush their stock into Canada before the law is proclaimed. The bill was read a first, second and third time on March 17.

HORT. SOCIETY OF CHICAGO.

The preliminary list of premiums for annual fall exhibition of the Horticultural Society of Chicago, to be held Nov. 8 to 12 next, has been issued. The premiums are as usual very liberal, and there are a number of interesting new classes. The international competition in chrysanthemum cut flowers is again announced, and the prize in each class has been increased to $6, the sweepstakes of $50 remaining as before. Copies of the list may be had on application to the assistant secretary, Mr. W. N. Rudd, Room 202, 185 Dearborn street, Chicago.

AN UNPARALLELED SUBSCRIPTION OFFER.

EVERY one to whom this issue of the FLORISTS' REVIEW is addressed, and who fills out, signs and returns the accompanying subscription blank, accompanied by $1.00, within 30 days from date, will receive not only the FLORISTS' REVIEW for one year but also a certificate entitling him to the earnings on one-tenth of a share of stock in the company formed to publish the paper. The shares will be of a par value of $10.00 each.

Why do we make such an unparalleled offer? It is very simple.

You will have an interest in the success of the paper.

You will see that you can buy everything that you want to just as good advantage from advertisers in the FLORISTS' REVIEW as elsewhere and at the same time benefit yourself by increasing the earning power of your certificate.

This mutual arrangement cannot fail to bring to the paper a heavy advertising patronage, and as a result the stock represented by your certificate will earn good dividends.

And the more you buy of advertisers in the FLORISTS' REVIEW (always mentioning the paper) the larger your dividends will be.

You will get a better paper than has yet been published in this field, and a share of its earnings. Please let us hear from you by early mail.

FLORISTS' PUBLISHING COMPANY,

530-535 Caxton Building, - - - CHICAGO, ILL.

TORONTO.

One of the first objects which attracted my notice on this visit to John H. Dunlop's was his new rose named Lady Dorothea, a beauty of the first water, justly meriting the award bestowed upon it recently in New York and could the committee see the plants at home they would feel still more convinced of its qualities.

Compared with Sunset, from which it is a sport, it is entirely distinct, the color being a soft, warm tint of deep pink, shaded with yellow. A fine, healthy stock is being worked up for distribution next year.

Bougere, both white and pink, is a tremendous bloomer, a perfect forest of foliage and blooms; Meteor, in third crop since December, foliaged to bottom and breaking freely; Brides and Maids in exquisite loveliness. Mr. Dunlop may be pardoned for being proud of such grand stock.

Carnations are not all that could be desired, but 'tis impossible to have everything just as one may wish, and if these are slightly off crop the record of pickings of Marie Louise violets makes interesting reading, a total number of 75,000 from 1,100 plants being considered not so bad.

Mr. Dunlop is a convert to the grafting method of raising roses after seeing the superb stocks being grown by Alex Montgomery, of Natick, and A. N. Pierson, of Cromwell. At the same time he "caught on" to J. N. May's method of using ordinary soft bricks upon slates in the propagating beds to neutralize the heat and finds the system an admirable one, both for adiantums in pots placed upon the clean bricks and cuttings placed in sand which keep moister and sweeter. He does not expect to have to change the sand through the entire season. Prospects are bright for Easter, both in crops and orders.

Mr. Dunlop finds a mixture of white lead and coal oil, with a dash of emerald green, a most satisfactory shading.

J. Gammage's Sons, at London, are in this satisfactory condition. They have lately added one house for Meteors 20x100, and are adding three more 10x185, to be opened at gutters for carnations. Stocks are in prime shape, particularly roses. Wootton is most satisfactory and Kaiserin proves itself a splendid winter rose, cropping continuously and breaking freely. A large stock of soft-wooded plants are raised for spring bedding.

Attention Florists....

New "Invincible" "D Series" Boiler For Hot Water and Steam

FARMINGTON, CONN., March 9, 1896.

Dear Sir: The "INVINCIBLE" boiler you placed in my Carnation houses, I am pleased to say, has given me great satisfaction. It has done all that you claimed it would do and could have done more if called upon. I did not have to run the boiler hard even when the thermometer stood 18 degrees below zero outside; it has proven itself to be "Invincible" in every respect. I find it to be a very economical boiler.

The one thing I like about it is that the heat does not all go up the chimney, which cannot be said about other makes of boilers I have on my place.

Your PORTABLE boiler I have run for three years and find it to be very economical and has done its work well in every way. Your boilers will do a great deal more than you claim for them. They are both "Invincible."

Yours very truly,
HUGH CHESNEY, Florist.

WESTBURY STATION, QUEENS CO., N. Y. March 10, 1896.

Dear Sir: It gives me great pleasure to inform you that the "Invincible" boiler you put in my latest greenhouses has given me the greatest satisfaction in every detail.

All the good qualities you claim for it I have found to be just as represented by you, and in every way I highly recommend it.

Very truly,
MRS. CHAS. RUSSELL, HONE.

Florists' Review....

GRAND RAPIDS, MICH.

Trade is still brisk, and very much unlike what was expected for the Lenten season. St. Valentine's day was the busiest day of all winter, excepting the holidays. It resembled the day before Christmas. Stock sold out early, and orders kept pouring in all day, particularly from out of town, with nothing to fill them with, and useless to attempt to buy. A new fad is on tap, and in a measure accounts for the unusual increased demand for Feb. 14. Many persons sent out cut flower valentines instead of the regular article. For instance, some of the school teachers would send a valentine of six or a dozen carnations or roses to each of the other teachers, and so on. It is an innovation to foster and encourage in other localities, as well as locally.

Although all large functions have ceased, weddings, funerals and the steady demand for loose bunches have kept flowers scarce. From appearances business promises to continue good. Bulbous stock is getting scarce, save daffodils and tulips, and the supply of smilax is dwindling toward the vanishing point.

The best grade of roses advanced 25 cents per dozen, and all prices yet remain firm. The weather is bright and warm, the days longer, and it is presumed the supply may soon equal and pass the demand point. The outlook for Easter stock is fair. Lilies are more or less diseased, and will be given a turn at the next club meeting.

Personal.

F. Postma and Mr. Blair have severed their connection with T. R. Renwick & Co., Mr. Postma going to work for Henry Smith, and Mr. Blair still undecided between an up north and down south engagement.

Chas. Bowditch, late with F. A. Chapman, is now traveling for Henry A. Dreer, of Philadelphia.

Wencil Cukierski, the city florist, has purchased a number of lots on the west side, on which to erect a greenhouse plant, should occasion require.

PROFIT IS CERTAIN.....

in the prudent and thorough heating of a greenhouse as much as in large sales of stock. If a florist is burdened by an unnecessary annual tax of from

$50 TO $100

for fuel and extra labor he must work much harder in order to make up this unnecessary tax out of the profits of his business. We know from our past experience that there is no unnecessary tax for fuel and labor when our boilers are used, because they are made after careful examination of the reasons why other boilers have failed and their construction avoids the defects shown. No one has bought

OUR BOILERS

that ever regreted it, and thousands have bought and look back at the cost as the best investment they ever made.

SEE WHAT

these florists say:

S. L. BRONSON, New Haven, Conn., Jan. 4th, 1898, says: I have in my greenhouse one of your No. 60 Standard Sectional Hot Water Boilers, bought June 28th, 1897. I find that its work is truly excellent, and think it is the best heater I ever had. I can find no fault with it in any particular.

GEGRGE BOYCE, Florist, Utica, N. Y., Jan. 31st, 1898, says: I have thoroughly tested the No. 50 Standard Sectional Hot Water Boiler bought of you last fall, and it is a pronounced success. It is very easy to raise the water to a high temperature and keep it so. The boiler is easy to operate. and I can arrange the fire at 10 o'clock at night and find it in good condition at 7 o'clock in the morning, and by the use of drafts quickly obtain a new, bright fire for the day. The arrangements for cleaning are admirable, as every part of the boiler is accessible to the light and cleaning brush. You have certainly secured the right construction for a first-class greenhouse heater, and I can heartily recommend it to all florists.

OUR GREENHOUSE CATALOGUE

is free, and we are in business to give information about our boilers and heating greenhouses, and solicit correspondence.

WE CAN MAKE

prices delivered at any station, so that a florist knows exactly what the cost will be of a boiler selected.

Greenhouse Heating and Ventilating Apparatus

The accompanying cut represents the interior of our new

No. 57 Sectional Tubular Boiler

regarding which we have received the following letters:

D. Falconer, Rose Grower, of Chatham, N. J., writes us as follows:

I am pleased to inform you that the new No. 57 Boiler you sold me last Fall has proved satisfactory in every respect. All that you have claimed for it I have found correct.

I have heated two Rose Houses with it, each 18'6" wide and 160' long, total amount of glass surface 8,000 square feet. I didn't have to push it much when the temperature was 8 and 12 degrees below zero to have my houses 56 degrees. I consider it economical in fuel, easily cleaned and very easy to fire. If I am fortunate in the future to extend my plant, I shall select the same heater.

Your ventilating apparatus is also to my entire satisfaction.

Respectfully yours,
(Signed) D. FALCONER.

I. P. Dickenson, Lettuce Grower, of Morganville, N. J., writes:

In answer to your inquiry as to how I like your New Sectional Boiler, would say that it gives good satisfaction, throws out heat freely, is easy to regulate, and requires very little labor and attention. I have two other sectional boilers, which it is claimed will heat nearly twice as much as yours, but I think yours, the No. 57, will beat them both, and with only one half the amount of coal. The No. 57 is a hummer.

Yours truly,
(Signed) I. P. DICKENSON.

Louis Dupuy, Florist, of Whitestone, L. I., writes:

It affords me great pleasure to tell you that your new sectional Boiler you supplied me last Summer, is a boiler far superior to any I have so far seen in use. It has not been in any way over-estimated, as it does easily all you claim for it. Every man I have had attending to the fires was quick in praising your No. 57 in comparison with the other boilers. Respectfully yours,
(Signed) L. DUPUY.

Anton Schultheis, Florist, of College Point, L. I., writes:

The sectional tubular boiler I received of you last October for my new house, 150x25', with high glass sides, has proved to be all you claim for it. It is economical, easy to regulate, and can be heated to boiling inside of thirty minutes if necessary. I can recommend your tubular boilers where large houses are to be heated. They will do the work.

Respectfully yours,
(Signed) A. SCHULTHEIS.

FLORISTS' REVIEW

COPYRIGHT, 1898, BY
FLORISTS' PUBLISHING CO., 520-535 Caxton Building, CHICAGO.

Vol. 1. CHICAGO AND NEW YORK, MARCH 31, 1898. No. 18.

ACACIA PUBESCENS.

The illustration shows a plant of this beautiful yellow-flowered shrub growing in a 10-inch pot, and will supplement the recent very interesting article on acacias by Mr. Herrington.

This species is easily grown with cool treatment, and when in bloom is greatly admired by visitors, but is rarely met with, and I do not know where a stock could be obtained in this country.

Our plants have never produced any seed, and we have found cuttings difficult to root. The graceful, pendulous sprays are fine for cutting, and add a delicate finish to the best floral work.

W. T. BELL.

Acacia Pubescens.

PLANTING AROUND A FOUNTAIN.

What could be used to advantage for a strip six feet wide running around a fountain, situated in a small park in the center of town? The fountain basin is about thirty feet in diameter, so the strip would be about one hundred feet long. The lower edge is about one foot above surrounding walks and inside edge perhaps eighteen inches above walks. In stating plants you would advise using, please also give number required. E. C. KECK.

Iowa.

As more or less spray will be carried from the fountain by winds, most flowering and foliage plants would be unsuitable, and tall growing plants would probably obstruct the view of the basin, though height of basin edge is not given in the inquiry. I would therefore advise Funkia undulata, Funkia undulata variegata, Funkia alba cordata, the smaller varieties of iris for outer edge, alternating with Hemerocallis Sieboldii, allowing two feet apart for funkias and eighteen inches apart for irises. C. J. S.

LINGERING CHRYSANTHEMUMS.

Our chrysanthemums are grown in the usual manner, on raised benches, one stem and one flower to a plant. The last of the main crop of flowers are cut in December, or very early in January, when the bench is cleared for something else. This season some of the plants were allowed to remain, and produced many medium-sized blooms from short side branches; and when these are removed, throw up stems from the ground that produce better flowers, that can be cut long enough to be useful.

We cut flowers of Maud Dean on March 5 from plants that had not been disbudded, the largest flower being six inches in diameter, and the plants

having then numerous buds.

The plants have since been thrown out; but were healthy and vigorous, and would undoubtedly have flowered for some time longer.

W. T. BELL.

MISCELLANEOUS SEASONABLE HINTS.

Easter Suggestions.

Just a few words more about the big week that is before us, and where we expect to make a little fortune, if it doesn't freeze hard. Last year with us, the Saturday before Easter was rainy. The two previous years it was freezing. This is such an exception to all other years in our memory that we announce with confidence that winter is past and gone, and tight packing cases, heated wagons, wrapping paper, warped tempers and twisted figures of speech will be entirely absent during our rush. With many of us it is a great rush and a trying time, even if we have the most favorable weather on our side. The more faithfully you endeavor to fill your orders, both as to quality, neatness and punctuality, the greater is the mental strain, and if you don't worry over these things, you are likely to have many a call-down and give serious offense in some places.

Therefore, to help out with filling your orders for the two days before Easter, which is often thirty days' work crowded into two, put off nothing for tomorrow that can be done today. You should clear off a space in one house or more. Over the sand or ashes that is on the bench spread heavy, coarse paper. Any number of plants will be bought early in the week, to be delivered "with this card attached, please," on the Saturday or Sunday. All those can have their pots well cleaned, the card attached, and address tag, and be put away ready for delivery. It is well to have a space set aside for Friday's delivery, another for Saturday, and for Sunday. Stood on this paper, the pots will be clean and pleasant to handle. You can then say to most any boy, "Get the Azalea in Saturdays orders labeled 'Mrs. Isidore De Blanco.'" You are also sure that most all of your good lilies, cytisus, mignonette, hyancinths and other plants will be wanted. Don't wait ti l the end of the week, and then have two or three men scrubbing pots and raising a great muss, and be in everybody's way. Have it all done before the real rush begins.

Crepe Paper.

Crepe paper will be used largely this year, and you cannot blame a customer for wishing the pot covered. Many a fine 10-inch pan of Dutch hyacinths was sold last year because they were tastefully fixed up with crepe, and lots of this work you can do ahead of time, particularly can you have the crepe paper—lots of it; cut into different sizes and of different shades, sizes to suit pots and pans from 4 to 12 inches.

I have no advice to give you about packing plants except this: If you have a lot of lilies to cart to town, don't stand them in the wagon, where they can swing about and jam their heads together. Tie half a dozen or more together, so when they swing they all go together, and no bruising occurs.

Shifting Geraniums.

If possible, don't delay in getting their pots in which they will be sold—your 3-inch geraniums shifted into a 4-inch. It takes some time to do this, where there are many thousands, and don't use too rich and light a soil. If it is a little heavy, so much the better. A rather heavy loam with a fifth of old hotbed manure will do them finely. Pot firmly and solid. It is flowers you want, and this condition will produce them. I have made a point of saying heavy soil and potting firmly, because sometimes we have to buy these geraniums, and often find them grown in almost pure rotten manure and leaf mould, the very opposite of what they want. They grow and produce leaves, and sometimes flowers, but fall about at the surface of the soil, and are poor things to plant out of doors in the sun and wind. The ivy leaf class is now very important. The soil for them can be a little richer, but pot firmly.

Much as hanging shelves or any sort of shelves are to be condemned, for in many respects they are a nuisance, it is difficult to find a place that will grow these ivy leaf geraniums and other droopers as well as the shelves. If you don't let them hang over the edge of a shelf, you must tie them up, which is much more trouble and not their natural way to grow. It is almost impossible to grow fine lobelias without the aid of shelves.

Transplanting Annuals.

As soon as the annuals, such as asters, zinnias, phlox, etc., are up an inch high, and before they smother each other, they should be transplanted into flats one inch or more apart. I like them in flats best, unless you grow tens of thousands, because you can keep them in the greenhouse a week or two before removing to a cold frame, where they will do first rate after the middle of April. If you are not an expert in this handling of small seedlings, learn to be. You can and must plant them deep enough, so that their leaves are almost touching the surface of the soil. Some people are very careful to squeeze the soil close to the plant at the surface, and leave the root very loose. The reverse is just what is wanted. The surface will close up with a good watering, but see that you get your dibble away down and pack the soil well around the roots. This seems almost unnecessary to write about, simple little operation as it is, yet I have seen hundreds of asters just perish because their roots were left dangling in a cavity.

Ventilation—Heating.

This extraordinarily mild weather may tempt some of you to let your fires out, and if you did on your carnation houses no harm, but on plant houses it would be poor economy, and more particularly would it be injurious to roses. If the thermometer stood at 60 degrees outside all night, and you were to close up the house tightly, with no fire, and were to repeat this a few nights, you would most assured y be attacked with that fungus (I don't know its name, but I know well its effect), and every leaf would drop, and even the young, tender growths would perish. When you enter the house in the morning and see the pretty dewdrops on the edges of the leaves, look out; three such mornings and the trick is done. This every rose grower has seen, both in fall and spring. It is not likely that you will let your fires out, but if you do, then leave on air and this trouble will not occur. Of course, the ideal conditions on mild nights are a little fire and a little ventilation.

A remarkably vigorous growth is noticeable the past few weeks on both roses and carnations. It is simply the abundance of fresh air we have been able to give them, approaching in a measure the conditions they would get outside. It is a lesson for us. Soil, water, and ventilation, or fresh air, are inseparable, and we can't grow flowers without a proper quantity or observance of all of them, but I really think that if either wants the closest watching and demands the greatest exercise of brains more than the others, it is ventilation.

W. S.

PLATEAU OF NARCISSUS.

The engraving is from a photograph taken especially for The Review of a plateau of narcissus arranged by Mr. Geo. M. Stumpp, of New York, for the

Plateau of Narcissus and Ferns.

center of a dinner table. It was photographed in the basement of the store and the surroundings must not be considered in connection with the plateau.

The width of the plateau was seven feet and it was made for a table twelve feet in diameter. It was made in four sections, to facilitate handling. A square space was left in the center, in which a central vase of flowers could be placed. The sections were made of boards and moss tied over the surface. In the arrangement the endeavor was to give the impression of a mass of daffodils, ferns and grasses growing together.

Nearly 700 narcissus flowers were used, including Von Sion, Trumpet Major and Golden Spur, and about 150 small ferns and grasses. In the center corners were four plants of Pteris tremula from 6-inch pots, the remainder of the ferns and daffodils being set in the mound as naturally as possible and sloping to the edges. The ferns were from 3 and 4-inch pots, but the daffodils were cut and "stemmed."

In the center of the plateau is seen a vase of the yellow Forsythia Fortunei.

THE BOUVARDIA.

[From advance sheets of the Florists' Manual, by William Scott.]

The bouvardia can be classed as almost a tropical plant, most of the species coming from Southern Mexico and South America. The hybrids of some of these species are what are of value to the florist. Twenty years ago the bouvardia was one of the most important of the plants we grew, but of late years, with the advent of long-stemmed carnations, the wonderful roses, the chrysanthemum and other more durable flowers, the bouvardias have been much less grown, and in commercial places they generally occupy but a small space, if any, notwithstanding they are beautiful and easily grown, and that the flower has grace and refinement. In these days of keen competition, the question is, "Do they pay?" That you must judge by experience in your own locality.

The best time to begin propagation is early March, with the roots of plants that have been grown on a bench for winter flowering. The bouvardia roots very slowly and unsatisfactorily from the young top growths, and in ordinary practice that is not considered a practical method of propagating this plant. We will begin with the young roots. Don't take the large roots near the base of the plants, nor the thin, thread-like roots of the widest growth. Choose the growths between these. Cut them into pieces about one-half or three-fourths of an inch in length and distribute them on a propagating bench, where you have a good heat, as you would coarse seed, pressing them into the sand. Then cover with at least an eighth of an inch of sand, pressing it down after covering. Water sufficiently to keep moist, about as you would other cuttings. In three or four weeks young plants will be springing up. When they have made two or three leaves and are an inch high, lift them from the sand and pot into 2-inch pots.

The bouvardia is a tropical plant and at no stage of its existence should it be exposed to a low temperature. This accounts for the very different treatment we give it from what is considered right in Western Europe. Plant out in the open ground about the first of June, or earlier, if you are in a latitude where no late frosts appear. A very light, rich soil is much the best adapted to the wants of the bouvardia. Unless there is a very long spell of hot, dry weather, no watering is needed after the first good watering when planted. The growth that has started in the greenhouse will continue to grow out of doors, but that is of little consequence, and can before lifting be entirely cut away. It is the strong, vigorous growth that will spring from the roots after being planted out that you will depend on to give you flowers. They want stopping about twice during the summer.

The lifting time will vary according to where you are. In Buffalo we used to lift about the second week in September. If later, and the weather should be cold, they are much slower in taking hold of the soil in their new quarters. A very good plan is to do the last pinching a week or so before you lift them. The break from this last stopping will then come in about right for the holidays. Plant in five inches of good loam, and as to distance apart, be guided by size of the plants. A foot apart is little enough for any of them. Anybody, with almost any temperature, can get the first crop of bouvardia, but to get them to make a growth and a profitable crop of flowers again in March requires heat. Unless they are kept in a night temperature of at least 60 degrees and syringed daily, they will just stand still after their first crop is over. The rampant way they grow and flower when the warm sun of April comes shows you what they want.

They can, of course, be grown in

pots, but do far better and are more easy to manage planted on a bench in a light, warm house.

If after the end of March you need the bench for some other crop you can cut down the bouvardias to within a few inches of the bench, lift them, shaking off all the soil, and place them close together in flats with three or four inches of moist soil around them and put under a bench where there is not much drip, and they will do there all right till planting out time. The old plants will of course be much larger than those propagated the first year.

Red spider attacks them, and so do mealy bug, but their presence is inexcusable, for a proper use of the hose will prevent both. Green fly will appear if fumigation is neglected, but be careful to smoke lightly, particularly when the plants are first housed, for they burn readily.

In lifting, I cannot say as you can about carnations, "let all the soil tumble off if it will, so long as I save every fibre," for they do not lift so well, or rather, do not recuperate so quickly. Lift carefully with a good ball of earth and for the first week shade and syringe frequently.

GREENHOUSE PESTS, SAN JOSE SCALE AND LEGISLATION VERSUS INSECTS.

[Read by Professor John B. Smith before the New York Florists' Club.]

The topics are wide, and either would furnish a text for a sermon if treated at large; but I will content myself with making suggestions rather than exhaustive and exhausting descriptions.

All rational methods for the destruction of insects, indoors or in the fields, must be based upon a knowledge of the character of the insect to be dealt with, of its life history and of the way in which the destructive agent is expected to work.

In the greenhouse where leaves and flowers are the desired products, many methods that are available in the field, become useless. The plants are more delicate, the foliage is more tender and the flowers must be guarded from anything that will tend to discolor or in any way injure their perfection.

We must attempt to arrange our practice so as to destroy the insects without harming our plants, and the selection of a proper agent is sometimes difficult. First, it is important to know how we kill insects. Of course in those cases where the creatures eat the leaf-tissue and we use arsenicals, the matter is simple. The poison acts through the stomach exactly as if some higher animal were the victim. But stomach poisons, especially arsenicals, are rarely desirable in a greenhouse, and the insects against which they are necessary are not among those that are most destructive.

Most of the greenhouse pests are suckers and creatures that live on the plant juices and merely puncture the outer tissue to get at the liquid within. Creatures like that cannot be reached by stomach poisons until we learn how to poison the plant circulation itself.

Of course the damage caused is in direct proportion to the number of insects present. A single plant louse, for instance, can do little harm; on a carnation leaf, for example—it makes a puncture or two, exhausts a few cells and dies. The amount of sap taken is insignificant, and not in the least a drawback to the plant. Locally we see a minute yellow spot, and if the leaf be held up toward the light and examined with a glass, a thin spot of exhausted plant cells is seen. With a higher magnification we may see the minute puncture itself. But this is not all, unfortunately. Bacteria and other disease germs are constantly present in the air and on the plant surface; so long as this surface remains unbroken they are harmless; but so minute are they, that even the slightest wound gives them entrance and the puncture made by a plant louse is more than sufficient. The exhausted and partly decaying cells injured by the insects form an excellent culture medium for the micro-organism and soon the minute spot begins to grow. Then we find a bacteriosis of carnations fully established and now a germ disease instead of an insect must be fought.

I do not mean to assert that all cases of bacteriosis are started in this way, for any skin wound will serve equally well; but it cannot be doubted that in a large percentage of cases the origin of the disease is from an insect puncture. As the insects increase in number, their injury becomes more severe. Yellow spots multiply and the plant begins to feel not only the loss of sap, but the failure of the leaves to exercise their proper function. The disease centers are equally multiplied and the plant becomes physically unfit to perform its work of producing perfect flowers in satisfactory quantity.

We get then one very important suggestion here—keep plants as sound as possible and deal with insects at once, when they are few in number, not when they have become so numerous that the plants are practically unable to recover. We must always remember that plants are living beings and responsive to both good and bad treatment. They are as variable in their resisting powers to outside influence as are the members of the animal kingdom, and the one in the best physical health in either case, stands the best chance of altogether avoiding injury.

To understand just how contact poisons work on insects we must consider for an instant the general anatomy, and particularly their mode of breathing. Insects have no closed system of blood circulation such as we find in higher animals. There is only one long tube more or less divided into chambers and this acts as a pump, forcing the blood into the head cavity and from there it makes its way through the body among the muscles and viscera until it finds its way back into the pump.

Neither do insects have lungs and yet they require air to purify the blood, for life is essentially the same in them as in man. Therefore a modification in structure has occurred and the air is carried in flexible tubes to all parts of the body. These tubes go everywhere where the blood goes and they open along the sides of the body—never on the head. An insect breathes, then, along the entire length of each side and there may be as many as 20 openings, although there are usually less. Ordinarily contact poisons act through these spiracles or breathing pores, though sometimes, on soft-bodied slugs, we can use caustics. In the greenhouse, however, these caustics would be almost as dangerous to the plants as to the insects, hence the safer materials which act through the spiracles must be employed.

These may be soaps of various kinds, tobacco decoctions, oils, dry powders or gases, and each of these acts in a different way.

One of the simplest of the remedies usually employed is sulphur, either dry or in the shape of sulphur water. In either case the result is due to the decomposition of the sulphur producing a vapor which is deadly to insect life. Against creatures like the red mite or spider so often found on violets and other plants, dry sulphur spread on the soil and allowed to decompose slowly by the warmth and moisture often acts like a charm. Sulphur, indeed, is almost a specific against mites or similar minute spider-like creatures. The gases given off by its decomposition seem to be deadly to them. To the plants it is harmless unless used in unreasonable quantity. Exactly where the reasonable line ends is a question which the experience of the gardener must ascertain for each line of plants; but ordinarily there is no risk in sowing the sulphur so as to yellow the soil very perceptibly.

The sulphur acts only when the insects are in the active stage, and does not injure the eggs, hence infestation may continue for some time after the sulphur is applied, and so long as any unhatched eggs remain.

Against plant-lice sulphur is of little use as compared with tobacco. Tobacco in all forms is a good thing. It is a fertilizer, the nicotine as it is gradually extracted by the moisture of the soil kills almost all insect life contained in it, and when vaporized it is death to plant lice. The mere smell of the tobacco while apparently unpleasant to many nsects is not poisonous to them. But an extract in water so applied that the insects became covered, is rapidly fatal. So tobacco smoke when breathed by insects is fatal to many, while it stupefies a yet greater number. I need not speak on this point to practical florists, all of whom have probably had experience in this direction. A very good way to use tobacco where pipes are sufficiently hot is to smear them with a tobacco extract and moisten from time to time until it has all evaporated. This will penetrate everywhere and will settle on everything in almost invisible globules, killing all the aphides that come under its influence.

This leads naturally to another very important point that must be considered and whose neglect accounts for many failures. Most insects have the bodies either pubescent, very polished, or powdery or somewhat waxy on the surface, so that they shed water quite readily and any application of a coarse spray simply rolls off without effect. So also the spiracles or breathing pores are furnished with protecting screens of hair or bristles which serve to keep out foreign material. A large drop of water or watery decoction has not the least chance of penetrating through this protection and the application is useless as an insecticide. Use the same mixture with an atomizer and the result will be quite different. The minute globules adhere readily to the insect because they are not heavy enough to roll off; they penetrate between the protecting screen or under it, and enter the body with the inbreathing. Therefore when tobacco or any other watery mixture is to be applied it should be put on in as fine a spray as can be secured.

For cleaning house plants of all save scale insects, a tobacco soap suds put on with an atomizer, is almost perfect. This brings me to soaps as insecticides and they act in a somewhat different way. When put on very strong they are of course very caustic and as dangerous to plants as to insects. Put on at a strength safe to the plants they clog the spiracles and thus choke the insects to death.

Some of you in days gone by may have made soap bubbles, and if you did not you have probably seen others make them. This is a good example of the tenacity of a soap film, and if such a one forms over the spiracles of an insect the creature simply chokes to death. That explains how soaps act and the one that forms the stickiest film is the best. Tar soaps, or fir-tree oil soaps are particularly good for that reason, and fish oil soaps come next. You can readily test the difference between these and the common hard soap suds if you make a solution of equal strength. The common soap suds will feel clean and smooth and crisp to the hand, while the others will feel more or less slimy. These soapy mixtures should also be put on in a fine spray and from what I have said you will realize that thoroughness is essential, for no insect not actually hit by an application will be in the least affected by it. Soap suds have an advantage over mere watery mixtures, because they adhere better. The insect surface that will shed a droplet of water will retain and become covered by one of soap-suds

An Easter Thought.

[Arranged and Photographed by Mr. W. T. Bell, Franklin, Pa.]

—hence a tobacco soap is better than a tobacco tea, though neither is equal to a tobacco smoke.

There is another point worthy of attention in the greenhouse. If soaps are to be used, those made with potash rather than with soda should be selected. Potash is a plant food and when washed into the soil acts as a fertilizer and is taken up and removed by the vegetable growth. Soda on the contrary in the form used in soaps is actually deleterious to the plants when present in any quantity, and a frequent use of suds made with a soda soap may easily impair the value of the soil for plant growth. In general, hard soaps are soda soaps, while soft soaps are potash soaps.

Dry powders are rarely used in the greenhouse, but whenever they are to be employed the reasons that call for a fine spray, call for the finest possible dust. The finer the dust, the more effective the application. Coarse particles are readily sifted out, but fine fragments penetrate and get into the body cavity where they can produce their characteristic effect.

Of the oils, kerosene only has been used to any extent, and this is a most valuable insecticide where its use is allowable. It is very effective even when greatly diluted, but it must be first emulsified before it can be mixed with water. This emulsion is prepared as follows:

Hard soap shaved fine,	½ pound.
Water,	1 gallon.
Kerosene,	2 gallons.

Dissolve the soap in boiling water and pour the kerosene, which should also be slightly warm, into the boiling hot suds—churn rapidly with a force pump for a few minutes, and you will get a beautiful, snow-white butter which will keep in a cool place for weeks, and will dissolve readily in water to any extent.

Thus much for insecticides in general, and now a few words concerning a very few kinds of insects. Of course the same conditions that favor the growth of plants also favor the development of certain kinds of insects, and particularly, plant lice or aphides, commonly called "green-fly" or "black fly" according as they vary in color.

These are peculiar in several respects and particularly their mode of multiplication. Their appearance I will not undertake to describe, but if a single large individual be observed for a few days in succession, it will be noted that a colony of small specimens, daily increasing in size and number, forms round here, and, as these attain full size in a few days they move off a little distance and in turn become centers of new colonies. If the watch be continuous and close, it may be observed that every few hours the mother of the colony gives birth to a living young and all her descendants are apt to be like herself, viviparous, parthenogenetic females. Some of them become winged, but that is not necessary to enable them to begin reproduction. Under greenhouse conditions no males are produced as a rule, and multiplication goes on with great rapidity. It is against such insects that the florist is most frequently called to battle, and besides the methods already mentioned, it may be in place to say that single plants may be often completely cleaned by the use of bisulphide of carbon. Bisulphide of carbon is a clear liquid like water which volatilizes rapidly, giving off an extremely foul odor which is poisonous to insects when confined in it. A dram is sufficient to poison one cubic foot of closed space, so as to kill plant lice without harming plants in one hour. In a closet constructed for the purpose, a number of plants might be placed at one time and completely cleaned, whenever such cleaning was desirable, as before sending to a customer. As the vapor is heavier than air and sinks, the bisulphide should be evaporated in a shallow dish secured in some way near the top of the closet. The objection to this material is its inflammability, but so long as this peculiarity is kept in mind it can be used with entire safety.

A somewhat similar process has of late been the subject of experiment in cleaning entire houses of insects by the use of hydrocyanic acid gas. This is secured by the action of dilute sulphuric acid on cyanide of potassium, and it is exceedingly poisonous to animal life of all kinds. The proportions are:

Fused cyanide of potassium, 98 per cent pure,	1 oz. weight.
Sulphuric acid,	1 oz. measure.
Water,	3oz. measure.

Use a glazed earthenware vessel and put in first the necessary water, then add the acid, and when all is prepared drop in the cyanide in small lumps. The formation of gas begins at once and the amounts above given will thoroughly fill 100 cubic feet of space. Plant lice succumb in a few minutes, scales in from one half to one hour—plants very soon thereafter. I do not know enough of the practical use of this gas to say much of its possibilities. I know that it has been used in some large houses; but I do not know the details. It is an exceedingly dangerous thing in careless hands, yet it may develop into a valuable method when we become better acquainted with its range and its possibilities.

Among the most troublesome greenhouse pests are scales; soft and armored. Soft scales are usually of considerable size; of the texture their name implies and brown in color. The young are smaller, much flatter and paler; usually quiescent, but capable of motion. In some species the young are produced alive, in some eggs are deposited under the female scales. Whichever is the case the florist must study the species until he knows when the young larvae are being produced. Then he should apply his washes promptly and thoroughly and at short intervals, for the larvae scales are easily killed, and once out of the way the plants will remain clean. Soap washes are best in this case, although, tobacco will do, if frequently used. The main point to be observed is the time when the young appear and prompt application as soon thereafter as possible.

The armored scales differ from the soft scales or Lecaniums in that the scale is separate from the insect itself which lies free beneath it. The armored scales have no power of motion when they are once fixed to the plant and their chance to travel is confined to a day or two just after they are born or hatched as the case may be. Treatment is much as already advised and is also effective in proportion to the promptness and thoroughness with which the application is made. No use to apply weak washes to mature scales.

pots, but do far better and are more easy to manage planted on a bench in a light, warm house.

If after the end of March you need the bench for some other crop you can cut down the bouvardias to within a few inches of the bench, lift them, shaking off all the soil, and place them close together in flats with three or four inches of moist soil around them and put under a bench where there is not much drip, and they will do there all right till planting out time. The old plants will of course be much larger than those propagated the first year.

Red spider attacks them, and so do mealy bug, but their presence is inexcusable, for a proper use of the hose will prevent both. Green fly will appear if fumigation is neglected, but be careful to smoke lightly, particularly when the plants are first housed, for they burn readily.

In lifting, I cannot say as you can about carnations, "let all the soil tumble off if it will, so long as I save every fibre," for they do not lift so well, or rather, do not recuperate so quickly. Lift carefully with a good ball of earth and for the first week shade and syringe frequently.

GREENHOUSE PESTS, SAN JOSE SCALE AND LEGISLATION VERSUS INSECTS.

[Read by Professor John B. Smith before the New York Florists' Club.]

The topics are wide, and either would furnish a text for a sermon if treated at large; but I will content myself with making suggestions rather than exhaustive and exhausting descriptions.

All rational methods for the destruction of insects, indoors or in the fields, must be based upon a knowledge of the character of the insect to be dealt with, of its life history and of the way in which the destructive agent is expected to work.

In the greenhouse where leaves and flowers are the desired products, many methods that are available in the field, become useless. The plants are more delicate, the foliage is more tender and the flowers must be guarded from anything that will tend to discolor or in any way injure their perfection.

We must attempt to arrange our practice so as to destroy the insects without harming our plants, and the selection of a proper agent is sometimes difficult. First, it is important to know how we kill insects. Of course in those cases where the creatures eat the leaf-tissue and we use arsenicals, the matter is simple. The poison acts through the stomach exactly as if some higher animal were the victim. But stomach poisons, especially arsenicals, are rarely desirable in a greenhouse, and the insects against which they are necessary are not among those that are most destructive.

Most of the greenhouse pests are suckers and creatures that live on the plant juices and merely puncture the outer tissue to get at the liquid within. Creatures like that cannot be reached by stomach poisons until we learn how to poison the plant circulation itself.

Of course the damage caused is in direct proportion to the number of insects present. Dissolve the soap in boiling water and pour the kerosene, which should also be slightly warm, into the boiling hot suds —churn rapidly with a force pump for a few minutes, and you will get a beautiful, snow-white butter which will keep in a cool place for weeks, and will dissolve readily in water to any extent.

Thus much for insecticides in general, and now a few words concerning a very few kinds of insects. Of course the same conditions that favor the growth of plants also favor the development of certain kinds of insects, and particularly, plant lice or aphides, commonly called "green-fly" or "black fly" according as they vary in color.

These are peculiar in several respects and particularly their mode of multiplication. Their appearance I will not undertake to describe, but if a single large individual be observed for a few days in succession, it will be noted that a colony of small specimens, daily increasing in size and number, forms round here, and, as these attain full size in a few days they move off a little distance and in turn become centers of new colonies. If the watch be continuous and close, it may be observed that every few hours the mother of the colony gives birth to a living young and all her descendants are apt to be like herself, viviparous, parthenogenetic females. Some of them become winged, but that is not necessary to enable them to begin reproduction. Under greenhouse conditions no males are produced as a rule, and multiplication goes on with great rapidity. It is against such insects that the florist is most frequently called to battle, and besides the methods already mentioned, it may be in place to say that single plants may be often completely cleaned by the use of bisulphide of carbon. Bisulphide of carbon is a clear liquid like water which volatilizes rapidly, giving off an extremely foul odor which is poisonous to insects when confined in it. A dram is sufficient to poison one cubic foot of closed space, so as to kill plant lice without harming plants in one hour. In a closet constructed for the purpose, a number of plants might be placed at one time and completely cleaned, whenever such cleaning was desirable, as before sending to a customer. As the vapor is heavier than air and sinks, the bisulphide should be evaporated in a shallow dish secured in some way near the top of the closet. The objection to this material is its inflammability, but so long as this peculiarity is kept in mind it can be used with entire safety.

A somewhat similar process has of late been the subject of experiment in cleaning entire houses of insects by the use of hydrocyanic acid gas. This is secured by the action of dilute sulphuric acid on cyanide of potassium, and it is exceedingly poisonous to animal life of all kinds. The proportions are:

Fused cyanide of potassium, 98 per cent pure,	1 oz. weight.
Sulphuric acid,	1 oz. measure.
Water,	3oz. measure.

Use a glazed earthenware vessel and put in first the necessary water, then add the acid, and when all is prepared drop in the cyanide in small lumps. The formation of gas begins at once and the amounts above given will thoroughly fill 100 cubic feet of space. Plant lice succumb in a few minutes, scales in from one half to one hour—plants very soon thereafter. I do not know enough of the practical use of this gas to say much of its possibilities. I know that it has been used in some large houses; but I do not know the details. It is an exceedingly dangerous thing in careless hands, yet it may develop into a valuable method when we become better acquainted with its range and its possibilities.

Among the most troublesome greenhouse pests are scales; soft and armored. Soft scales are usually of considerable size; of the texture their name implies and brown in color. The young are smaller, much flatter and paler; usually quiescent, but capable of motion. In some species the young are produced alive, in some eggs are deposited under the female scales. Whichever is the case the florist must study the species until he knows when the young larvae are being produced. Then he should apply his washes promptly and thoroughly and at short intervals, for the larvae scales are easily killed, and once out of the way the plants will remain clean. Soap washes are best in this case, although, tobacco will do, if frequently used. The main point to be observed is the time when the young appear and prompt application as soon thereafter as possible.

The armored scales differ from the soft scales or Lecaniums in that the scale is separate from the insect itself which lies free beneath it. The armored scales have no power of motion when they are once fixed to the plant and their chance to travel is confined to a day or two just after they are born or hatched as the case may be. Treatment is much as already advised and is also effective in proportion to the promptness and thoroughness with which the application is made. No use to apply weak washes to mature scales.

Now it has been suggested that I should say something about the San Jose scale and about the attempts to legislate it out of existence. I am afraid that almost too much has been already said on the subject—enough at any rate to induce Germany to forbid the entrance of our fruit and living plants into her markets. Just how far this will be enforced, it is impossible to say at present, but perhaps far enough to make the unwisdom of the "scare" that has been caused, thoroughly apparent. That this insect is a destructive one if left to itself, is beyond question, and that we have not yet found the best method of dealing with it may also be admitted. I am firmly convinced, however, that legislation is not that best method, for laws do not enforce themselves, and if the energy displayed in securing legislation were devoted to experiments in the orchard, the result might be different. We know the life history of the insect now, thoroughly; we know that we can kill it if we are persistent, and as compared with some plant diseases it is almost harmless. In the very worst infested district in New Jersey the fire blight killed more trees last year than the scale has done in the ten years that it has been with us. In one of the best peach orchards in New Jersey the scale has been present ever since it was put out. None but careful horticultural treatment was given until the present Winter and of more than 1,000 trees, not one has been in the least harmed by the scale. Plant disease cut off 10 per cent. of the orchard last year, and 20 per cent. of some varieties. Why not legislate against that?

Legislation has a place undoubtedly in our battle with insect foes, but it is rather to give us a weapon than to act itself. There are always some men who are behind the times or who are congenitally unable to comprehend that anyone has rights that they are bound to respect. Such men occur among the farmers as well as elsewhere, and in some cases they maintain a veritable nuisance on their grounds in the form of insect infested plants from which adjoining lands became infested; such men should be compelled to look after their property to the extent of saving their neighbors, and legislation can help us to that point and no further. Of course, inspection of nurseries is a good thing in so far as it informs the nurseryman of the condition of his own affairs and he can make it, if he chooses, the basis of a guarantee to purchasers that his stock is clean. This will be of some tangible benefit to the purchaser if he is careful to deal with responsible firms, but as it is now, a certificate is a protection to a dishonest dealer since it gives him something to hide behind should his stock prove, later, to be either diseased or infested by insects.

It seems almost as if there was an epidemic of a new disease which may be called "certificatitis," sweeping through the country, and its most prominent symptom is a craving for a written formula which is expected to replace the necessity for personal care and examination.

It is admitted in the very latest expression from Mr. Alwood, who is one of the chief promoters of legislation, that a certificate may be dishonestly affixed to stock or that an inspection may fail to discover infestation if it is slight. As a matter of fact, certificated stock has been received in New Jersey from three states this past Winter infested by the scale.

In such cases certificates are a positive source of danger, since the purchasers are apt to rely upon them too implicitly and to assume that they are a guarantee which obviate the necessity for personal care and inspection. Whether florists will ever suffer from this pernicious scale is a question. The insect infests almost everything. Its normal food plants are perhaps the tree forms of the Rosaceae. But vines and shrubs, as roses, blackberry, raspberry and the like, are also infested, and roses particularly, are sources of danger.

ORCHIDS IN JADOO.

I send you this day the photo which represents three plants of a batch of 100 Cattleya Gigas which arrived late last fall from a friend of mine in South America. Half were potted in the usual way, with peat and moss; the other half I potted in "Jadoo." The two outside plants are those potted in "Jadoo," the center one being the one most advanced of the 50 that were potted in the old way. Think this as good an object lesson as could possibly be given.

Would state that a few grains of common sense will have to be exercised by those growing orchids in "Jadoo," as they will not stand overwatering. The method I have used is th's: For cattleyas, Laelias and the like, shake out all the fine particles, the same as when using peat, using only the most fibrous parts, adding about half the quantity of small nodules of charcoal. This makes the compost reasonably open, and the air gets at the roots to some extent. For cypripediums and such as are to be grown in pots, use the finer parts, making the compost somewhat more open with additional charcoal, and, if possible, water with the Jadoo liquid, diluted with rain water.

Experiments with other plants are just as satisfactory, notably with rubbers, fuchsias, gloxinias, and ferns.

The Cypripedium bellatulum album exhibited by me January 1, 1898, and awarded silver medal by Mass. Hort. Soc'y, was grown in "Jadoo;" also Cypripedium Lathamianum and the Cypripedium Wm. Wallace Lunt exhibited February 19 and 12 respectively, and each awarded first-class certificates by above society, were grown in "Jadoo."

In conclusion, would say that if horticulturists have brains and are willing to exercise them, by all means grow your plants in "Jadoo," but if you are going to grow plants on the hit or miss plan—let it alone.

WM. WALLACE LUNT.

Hingham, Mass.

CHICAGO.

Club Meeting.

The disease of Lilium Harrisii was the subject for discussion at the last meeting of the Florists' Club, and it was opened with a most interesting talk by Mr. E. Buettner, who brought with him for purpose of illustration quite a variety of diseased bulbs and a hand magnifying glass. As has been previously stated in these columns, Mr. Buettner believes the disease is wholly due to the little white mites found on diseased bulbs, and he showed bulbs that had been honeycombed by the little pests. Under the naked eye they look like small grains of white sand. Under the magnifying glass they are seen to be nearly round, and slow in movement, though they are blessed with six legs. Mr. Buettner has found the same mite on diseased bulbs of hyacinths, tulips, irises, Japan longiflorum and tuberoses. His experience with Harrisii has this year been more disastrous than ever and he estimates his loss from disease at about 60 per cent. He does not care to grow any more Harrisii unless he can be assured of unaffected bulbs. He believed the disfiguring of the foliage to be caused by the bites of the insects on the tender heart of the bulb before growth had started. He found that tight bulbs seemed less affected than those in which the scales were loose. The mites do their work mainly at the base of the bulb, and that is where decay starts.

In his opinion, the only way to eradicate the disease is to promptly destroy every affected bulb. He believes that if the Bermuda growers made a really earnest effort to that end they could yet preserve the lily growing industry, and that if they do not take some radical and effective steps at once their market for bulbs will dwindle to the zero mark with lightning-like rapidity. He is firmly convinced that Harrisii bulbs can be grown in this country, and spoke of a lot of bulbs he had a few years ago that had been grown in Louisiana. They were quite green in color and he had grave doubts about them, but they proved to be the most satisfactory lot of bulbs he ever had.

In speaking of the theory that the difficulty with the Bermuda Harrisii was due to exhaustion of the soil from lack of rotation in crops, he said that we were too prone to advance that excuse when mysterious troubles arose. He cited the case of growers of the sugar beet in Germany. Sections where the sugar beet had been successful for years suddenly met with almost complete failure and the trouble was considered due to lack of rotation in crops, but investigation showed that the real cause was a nematode similar to the eel-worm that now gives rose growers so much trouble. The soil was cleared by planting a crop of summer turnips, of which the nematodes were equally fond, and when the worms were in the turnips they were gathered and burned. After clearing the ground in this way the sugar beet was again cultivated as successfully as before.

He compared the careless methods of the Bermuda growers to the scrupulous care exercised by the Holland growers. There every bulb to be used for propagating from is rigidly examined before being so used, and any bulb found to be in any way affected by disease is promptly burned. While it is true that the Holland growers have found diseases that they cannot eradicate, they have kept them in check, and but for this care and watchfulness the bulb growing industry in that country would have been seriously threatened.

Orchids grown in Jadoo.

Another point noted by Mr. Buettner was that the smallest bulbs seemed to be most affected by the disease. On this account the larger sizes were the most economical under present conditions. It was suggested that lime might be useful in preventing the ravages of the insect, but that the only effective plan of campaign would be inspection of every bulb by the grower when replanting and the prompt destruction of any affected ones. He believed that the mites existed entirely in the bulbs and that destroying affected bulbs would clear the soil of the pests, though it would be safer to use new ground if possible. All bulbs that have brown spots on the scales are infested with the mite.

Mr. Buettner told some humorous stories of the days when Harrisii lilies were first received from Bermuda, and how they were sold as "everblooming lilies" that would bloom at least three times during a season.

He finds the Japanese longiflorum a great improvement over Harrisii for late forcing. In fact, he found them rather too early this year. Some intended for Easter were in bloom six weeks before that time, due, of course, to the unusual season.

Change of Hall.

The trustees reported that they had secured an option on a meeting place in Handel Hall building, 40 Randolph street, at much more advantageous rates than the present meeting place, but that it could be secured only for the first and third Fridays of the month. It appearing that Friday was as acceptable to the majority present as Thursday, the trustees were instructed to secure a lease of the proposed new quarters. Therefore, after May 1 the meetings will be held on the first and third Friday of each month at Handel Hall building, 40 Randolph street, fifth floor. Elevator runs till 11 p. m.

Next Meeting.

It will be "Private Gardeners' Night" at the next meeting of the club, to be held April 14, in the present quarters of the club. The private gardeners are expected to turn out in force on this occasion, and each one is invited to bring something of interest for exhibition.

The Market.

The market is steadier than last week and stock has been pretty well cleaned up in most lines. Lilies and good violets have gone better to a noticeable degree. The outlook for an unusually good trade at Easter is excellent. All the dealers feel convinced that it will be a record breaker. But it is thought that the supply will fairly equal the demand and that the only shortage will be in high grade lilies. Some fear a shortage in good carnations, while others feel sure the supply will be sufficient. Easter quotations appear in several advertisements in this issue.

Various Items.

John Mangel has shown his confidence in the future by taking a three-year lease of the elegant store at the northwest corner of State and Washington streets at a rental of $8,000 a year. And the large business done so far indicates that a big price for a choice location is a good investment.

A. Lange has a unique window at his new place, 51 Monroe street. It is a basement store, but as there happens to be no window at that point on the main floor his bulk window is allowed to rise six or seven feet above the sidewalk level. By a system of shelves he is enabled to make an unusually fine display, and there is always a crowd of people looking down into this cave of beauty. He has this large window closed in from the store on the inside and can keep the window so cool that his whole stock can be on display, while from the store a customer can step into the lower part of the window and make selection of flowers. The store proper is being very handsomely fitted up.

A. L. Randall's new wholesale store at 4 Washington street is a remarkably convenient one and he is having it fitted up in first-class style. It is more than double the size of his old store, the walls are nicely papered, there is elevator service, and his front windows face the public library. Two extra large ice boxes are being placed in position and the bench room provides an immense surface for laying out and handling stock. He does a large local trade and he has a unique arrangement whereby customers may inspect stock with comfort while the boxes are being opened. On top of and along the back of a wide bench 45 feet long is a smaller bench, upon which customers may be seated while observing the operation of opening up, and the one that speaks first gets the stock. A. L. feels that he is right in it with his new place, which is but a short distance east of Wabash avenue, the headquarters of the bulk of the wholesalers.

Ed. Winterson has added to his combination suit a blue shirt with white spots about the size of a quarter and as striking as moonflowers in a catalogue cut, also a pair of dark colored

glasses to protect his eyes from the moonflower display.

An art gallery is the latest addition to Reinberg Bros. High art, too, so high that the bookkeeper has to use a step ladder to make the entries in the combination.

Recent visitors: P. Vos, representing the Holland Bulb Co., Oegstgeest, Holland; C. L. Whitney, Traverse City, Mich.; H. Van Teylingen, representing Van Zanten & Co., Hillegom, Holland.

Mrs. A. H. Saxon wants to rent the greenhouses left her by her late husband. There are five houses, at Downer's Grove, an acre or so of land and a four-room cottage. This seems like an excellent opportunity for some young florist, as a very low rental will be made. Full information may be had by addressing Mrs. A. H. Saxon, Downer's Grove, Ill.

WASHINGTON.

S. A. F. Committee Meeting.

According to reports in the daily press, the executive committee of the S. A. F. met here on the 14th inst., and it was a very successful meeting.

The visitors were given a drive about the city and to the establishment of the American Rose Company, and on the return the party lunched at the Maltby. The party was then conducted through the new Library building and through the courtesy of Mr. Durfee visited the capitol and were admitted to the senate cloak room, where they were introduced to several senators and were also extended the courtesy of seats in the reserve gallery.

No correspondents were invited to any of the functions of the committee and the daily press is responsible for news of the meeting.

The florists feel slighted in not being invited to the meeting or receiving some recognition, but from the fact that a government official steered the party and planned the meeting it was evident that the florists were not wanted. The whole arrangement seems to have been in charge of this official. This official, I am informed, characterized the Washington florists as asses for their endeavor to stop the existing abuses of free distribution by the government, in which case the Baltimore, Philadelphia, Cleveland, St. Louis and other clubs, for their endorsement of our action, must be included.

The florists would have been only too glad to have postponed the banquet held by them the week previous and joined in to make the visitors doubly welcome had it been possible, but under the circumstances it was not permitted. The florists were not invited to the meeting, or to meet the gentlemen, but were kept in the dark as to the proceedings. But on the eve of the banquet they were approached and asked to help defray the expenses. While all were eager to show the visitors the usual courtesies, they could not consistently do it in that way. The menu cards gave the impression that the banquet was given under the auspices of the florists of Washington. There were but five present, and four of this five are not in sympathy with the movement against free distribution by the government. These were Wm. Gude, A. Gude, Wm. Clark, Benj. Durfee and J. H. Small, Jr. Others present were Hon. Jas. Wilson, Secretary of Agriculture; Wm. R. Smith, Superintendent of Botanical Gardens; Col. Ed. B. Hay, Rev. Dr. Thos. C. Easton, Adam Graham, Wm. J. Stewart, J. G. Esler, Elmer D. Smith, Geo. M. Kellogg, E. H. Cushman, W. W. Coles, E. M. Wood, W. K. Harris and Robert Kift.

In justice to Mr. Gude I might add that at the first of the agitation against the free distribution of flowers by the government he not only took an active part, but signed his name to the protest sent to the Secretary of War. The florists cannot see how the S. A. F. would be embarrassed by any action he might take as an individual in sympathizing, or even taking an active part in our cause. We also think that the florists should have been invited to send a delegate to state their grievance before the executive committee and let them take such action as they deemed proper. But with the official mentioned in charge of arrangements such would not have been proper from his point of view, to let the so-styled asses state their case. I trust the S. A. F. was intended for the benefit of the florists as a whole and not for a chosen few.

Trade Conditions.

Business has improved very much, potted stuff selling especially well. The extreme warm weather has started the people getting their gardens in shape and many have already bedded out plants that will succumb to the cool nights before Jack Frost has left us.

The large plate glass in the store window of Mr. J. Louis Loose was broken recently by an unruly horse backing the vehicle it was attached to into it.

The prospect for Easter stuff is encouraging; every one seems to be well stocked and only waiting for it to come. Easter lilies will not be so scarce this year as they were last and will be of much better quality. W. H. K.

BOSTON.

Mass. Hort. Society.

The spring exhibition of the Mass. Hort. Society, held last week and extending over four days, was a decided success. Among the many excellent things shown may be mentioned the beautifully grown cyclamens exhibited by Mr. Donald, gardener to J. S. Bailey, and Mr. John Barr, gardener to Mrs. Cheney. The competition between the two was very close. Mr. K. Finlayson, gardener to Dr. C. G. Weld, showed some extremely well grown specimens of Acacia Drummondii, A. pubescens and A. cultriformis in fine flower, also some well grown hyacinths, tulips and narcissus.

A very interesting exhibit by Mr. Cameron, superintendent of the Botanical Gardens at Cambridge, included Dendrobium nobile nobilius, and D. Fitchianum, the latter rarely seen in such good form. Mr. Thatcher, gardener to John L. Gardner, made his usual fine display of orchids, hyacinths, tulips, narcissi, etc., and his collection of polyanthuses and primroses was much admired.

Warren Ewell, of Dorchester, was again to the front with a large collection of finely grown bulbous plants, and he was the winner of many prizes. Mr. Peter Fisher, Ellis, Mass., exhibited his new carnation, Mrs. Thos. Lawson, and was awarded the society's silver medal. Mr. Patten, of Tewkesbury, was also a successful exhibitor.

The regular weekly lecture on Saturday was by Mr. Henry Lincoln Clapp, of the George Putnam School, Boston, on "The Native Ferns of New England." The lecture was illustrated by stereopticon views, which made it very interesting and instructive. At the close a unanimous vote of thanks was tendered the lecturer.

Various Notes.

Recent visitors: H. A. Siebrecht, New York; Mr. Fotheringham, representing F. R. Pierson Co., Tarrytown, N. Y.; A. Dimmock, representing Sander & Co.

We regret to have to report the serious illness of Mr. Fred Becker, Cambridge, with pneumonia. For a few days his life was despaired of, but he is reported to be now improving, and hopes are entertained of his recovery.

C. H. J.

A SUCCESSFUL WHOLESALE FIRM IN BOSTON.

It is about twenty years since Messrs. Welch Bros., proprietors of the City Hall Flower Market, Boston, began the wholesale business, and they may now be truthfully designated the pioneers in the wholesale business in New England. They have originated many important methods of simplifying the handling of the immense quantities of flowers that are shipped to them daily. It is well known that they were the first to introduce the grading of flowers as to quality, and by this means they not only gained better prices and gave better satisfaction to the customer, but were enabled to increase the returns to their growers. The results of this system were so satisfactory that it is now almost a universal custom in the trade.

It is also stated that they were the first to introduce the system of designating the consignments of each grower by letters, thus enabling them to trace the ownership readily and without question of doubt. There has never

City Hall Flower Market, 15 Province Street, 9 Chapman Place, Welch Bros., Proprietors, Boston, Mass.

The largest market for sale of flowers in New England.

been an error that could not be quickly traced and as quickly corrected. Accuracy in this work is vital and this system seems to meet all requirements. Something over a hundred growers, some of them the largest in New England, consign to this firm, and it is marvelous how the immense stocks find a market in so short a time.

Their commencement was made on Tremont street, near the Tremont theater, where they remained until the premises were too small for them to handle their largely increasing business, and about eight years ago they removed to more commodious premises, but as the business was rapidly increasing they again had to look for a larger store, and took the one they now occupy, where they have ample room. The refrigerator, which runs the entire length of the store from Chapman place to Province street, is a superb structure and a work of art, which was arranged and built under the personal supervision of Mr. P. Welch, the senior member of the firm. It takes ten to twelve tons of ice to fill it, and is said to be the largest ice box among the florists of the east. The Welch Bros. still report a largely increasing business, and there are times when, with all their immense and increasing consignments of flowers, their stock to supply their orders is short.

The brothers have merited their success by strict attention to business and rigid integrity, and these qualities can not fail to assure continued success. Mr. P. Welch, the senior partner, attends to general details, Mr. Ed. Welch has charge of the shipping department and Mr. David Welch looks after the finances, and the three brothers are always at their posts. C. H. J.

PHILADELPHIA.

Trade Review.

Plant business was decidedly lively last week and promises well for Easter. It will be a bad year for many growers of lilies, but for everything else prospects are bright. Large palms and ferns are in demand, many growers having received orders from the firms who do a large shipping business. One sale alone filled four large vans, chiefly with arecas.

The cut flower market is quiet, nevertheless a good deal of stock is sold at moderate prices. Brides have been in brisk demand. It seems a pity this rose does not sell a little better in mid-winter. When prices are high and flowers scarce the Bride is generally the hardest to sell.

A great many visitors have been in town during the past fortnight and an encouraging amount of stock has been ordered for shipment. It is said one grower could have sold all his flowering plants of certain varieties, but preferred to keep part for his regular customers.

I met my friend, Mrs. Harris, in Joseph Kift & Son's store last week. Now I am always especially glad to see Mrs. Harris, because she is not only bright and charming, but is exceptionally well posted floriculturally and her ideas are always interesting. After a few words about the lovely flowers, Mrs. Harris asked me if I would wait just an instant and walk down the street with her. I am not generally enthusiastic about walking with ladies in business hours, but Mrs. Harris is a special favorite, moreover she doesn't often ask me. After waiting the five minutes I was rewarded for my patience by being allowed to carry the box of flowers. No sooner had we gained Chestnut street than Mrs. Harris turned to me with rising color and asked me if I had read "that dreadful Philadelphia article in The Review?"

I answered weakly that I had not, but feeling a twinge of conscience added that I knew in a general sort of way what was in The Review. Mrs. Harris smiled at my confusion. "Oh, I don't mean anything that poor dear Mr. Farson or you wrote," she said, "but that unkind charge of hypocrisy against Mr. Wanamaker—'Holy John' indeed! Why, if it was not for Mr. Wanamaker we could not have afforded to buy lots of nice things last winter."

Notes.

S. S. Pennock is receiving some fine "Bird-in-Hand" carnations from E. J. Weaver. The variety resembles Helen Keller somewhat in coloring.

Quite a number of weddings are expected in Easter week.

One of our crack Beauty growers shortens his stems when the price is not sufficiently long.

Yellow daisies and single jonquils are much in evidence in the stores.

Some colored swainsona, pink and blue, sent over from New York, did not sell. The colors are not "lively" enough.

E. A. Seidewitz, Baltimore, Benjamin Durfee, Washington, Henry Seibrecht, New Rochelle, and J. L. Dillon, Bloomsburg, were in the city last week. J. W. Y.

NEW YORK.

Among the Wholesalers.

Down! down!! down!!! That is where the prices have been going the last few weeks and it is hard to say at this writing when the down grade will stop. Not much before Easter, anyway, and if the quantity of stuff coming in now is any indication of the future, there will undoubtedly be no surpluses by the time Easter arrives.

The quantity of Beauties coming in now is phenomenally large, and accordingly prices phenomenally low, 20 cents apiece for fancy stock being the limit asked. It is a pity this commodity cannot be more evenly distributed over the season.

The top price for Maids and Brides is $6.00 to $8.00 per 100, when you can sell them, and $10.00 per 1,000 when you can't; that is, for a "straight slip" or "as they run;" "run of the mine," so to speak.

Meteors are way down, while Brunners reach top at 35 cents for the very best. It is a peculiar fact that "red goods" are slow stock at this season of the year, the opposite from Christmas.

The carnation market is fairly strong, the light supply and off crop tending, if anything, to "bear"—with prospects of a shortage at Easter, the recent mild weather contributing a good deal to this fact.

Violets sell in quantity at $1.00 per 1,000, while a few extra lots sell for 25 cents per hundred. Bulb stuff is selling below cost of production, and there is a glut in all lines, valley and Von Sions suffering most.

Cattleyas are getting very scarce and hard to pick up at fair prices. Taken as a whole, however, this commodity has fared very well during the winter. Smilax is still a good thing, while purple lilac sells poorly; white somewhat scarce.

Mr. John Raynor is optimistic of the future, and does not believe there will be any war, but in case the lumber market should be cornered he has laid in an extra supply of shipping boxes for the Easter trade.

Victor Zuber, of Flushing, L. I., the well known grower of hybrids, is sending some very fine Brunners to Mr. Thomas Young, Jr.

Ussing & Nelson are getting settled in their new store, 115 West Thirtieth street. They are, I believe, the last of the Forty-third street contingent to move into New York's "Covent Garden" district.

Mr. G. E. Bradshaw is receiving some excellent carnation Buttercups, besides some Connecticut violets, from Mr. A. Wuerz, of Darian.

N. Y. Florists' Ass'n.

At the special meeting of the New York Market Florists' Association there were about fifty members present. The principal business was the signing of applications for stands, and about forty-two responded. The following growers were elected: J. Bauman, Middle Village, L. I.; Chas. Trauth, Flatbush, L. I. On a motion it was decided to open the market March 28, at 4 a. m., and to continue the market as long as the weather and business permitted. The following members were appointed as executive committee: J. Birnie, E. J. Van Reyper, J. T. Schupp, T. Fieldhouse, W. Brennecke, with power to act on all important matters affecting the association. Mr. F. Lehnig, who has fully recovered from his recent illness, presided. The next regular meeting will be held April 12th, owing to Easter week.

Various Items.

Mr. J. M. Logan, late superintendent for Whitelaw Reid, will in future engage in the landscape business, with offices at White Plains and New York city. Mr. Logan is vice-president of the New York Florists' Club and well known in horticultural circles.

The National Florists' Board of Trade was recently incorporated, with the following officers: President, Alvan Thomas; vice-president, Charles D. McDougall; secretary and treasurer, Cornelius S. Loder. They will move into more commodious quarters at an early date, and say their membership has doubled since the first of the year.

Mr. A. J. Wadley, New Brunswick, N. J., was a recent visitor.

Brooklyn.

Rudolph Jahn, 492 Nostrand avenue, Brooklyn, I am sorry to state, has made an assignment for the benefit of his creditors. He carried on a retail business, and ascribes his failure to the dull times and slow collections.

ST. LOUIS.

March Business Good.

The March business has been very good. Everybody seems satisfied, and stock has not been overplentiful the last few days. The past week we have had lots of rain and one day a good snow storm, but not cold enough to do any harm. A few days of warm spring-like weather will make the shipping trade boom.

Easter Stock.

Easter stock is in good shape all along the line and should the weather turn warm there will be plenty of it on hand at all the growers. The flowers that come in now are not so good in quality as they have been, but in sufficient quantities to satisfy the buyers.

The fact that there will be an increased demand for Easter is proved by several large orders that have been placed already for Easter business. The wholesale men say that Easter prices will take effect about April 7.

Current Prices.

Prices on stock were as follows the past week: In roses, good first-class Brides, Maids, Meteors (very scarce) and Carnots, $6; seconds, $3 and $4; Woottons and Perles, $3; La France, $5. Beauties are still very scarce and the best are selling at $4 per dozen; short ones 60 cents and $1 per dozen. Carnations are very fine just now and the demand exceedingly good. The fancy kinds sell at $3 and the others from $1.50 to $2 per 100.

Bulb stock has been a drug for two weeks past, but slackened up somewhat at the end of the week. Harrisii have been in great demand, the price going up from $6 to $10. Callas are also in fair demand at $8. Romans and paper whites are scarce; Dutch hyacinths plentiful at $3 and $4 and a great many of them going to waste. Valley is very fine at $4. Tulips have been selling better but low, $2 being the price.

Violets have slackened up and only a very few are coming in. Californias are the only ones that sell well, 35 and 50 cents per 100 being the price. Sweet peas are not over plentiful, but those that come to this market are fine and sell at $1.50. Smilax and asparagus are in good demand, with supply a little short.

Notes.

M. M. Gaylord is in town representing Kraft's Plant Tonic Co., Rockford, Ill. Mr. Gaylord says the tonic will give new life to plants. It also destroys insects and scale.

Mr. Clamp, of Webster Grove, Mo., is cutting some very fine La France roses, the best seen in this market for a long time.

Henry Ostertag, of Ostertag Bros., reports that they furnished the McGrew-Lambert wedding last week, the largest of the season. Business has been good with this firm during Lent.

Riessen Floral Co. furnished the decorations at the opening of the new Columbia theatre last week. The work was a credit to the firm.

Gus Eggling, the South Grand avenue florist, reports a great deal of theatre work of late and business good during Lent.

C. Young & Sons Co. report heavy shipping orders for plants and seeds. This firm stands at the head in this line of business in this city.

The members of the Florists' Club should not forget that on Thursday, April 14, at 3 p. m., will be our annual Rose meeting, and President Halstedt requests that all members and all nonmembers in the trade should be present without fail.

Mr. C. C. Sanders, who should have read an essay on Nursery Stock at the last meeting, but prevented by business from being present, reports that he will be ready with the essay by the next meeting.

J. M. Gasser, of Cleveland, O., spent a day in St. Louis, on his way home from Mexico.

Mr. and Mrs. Frank Fillmore, Sr., will celebrate their golden wedding on Friday night, April 1, at the home of their son, Frank Fillmore, 4232 Nebraska avenue.

Of Interest to Bowlers.

The Bowling Club had a good attendance on Monday night, and some great scores were made. The high man of the evening was Carl Beyer; in the three games rolled he made 633; Beneke, second, with 573, and Schray, third, with 561. The high single score was by Beyer, with 266; Kuehn, second, with 228, and Schray third, with 200. This ended the March series of twelve games. J. J. Beneke wins the average medal with 2,077; Kuehn, second, with 2,068. High single score goes to E. Schray with 268; C. Beyer, second, with 266, and Kuehn, third, with 228. Next Monday night the new series begins. All are welcome. J. J. B.

BOSTON.

Old Sol accompanied by zephyrs of spring is playing the dickens with stocks of some of those growers who are ahead of the game, but others who are right in it defy his beams. Among the fortunate ones are Wm. A. Bock who has two houses of longiflorums in capital shape and almost all engaged.

Wm. W. Edgar is the possessor of a really fine stock of longiflorums, azaleas, rhododendrons and cytisus all engaged; a capitally grown lot which not to sell would be a reflection upon the public taste.

I noted some grand specimens of Acacia paradoxa which is rather paradoxical to Dan Murphy, the successful grower for W. E. Doyle, who is asking himself why the bloom drops so easily this year but if he is off on this he is right in it with the grandest lot of hydrangeas to feast one's eyes upon. The foliage is of that leathery firmness which betokens a hardy, well grown plant. These are in a house fitted with side ventilation (as well as above of course) in the pink of condition. Azaleas and lilies are in splendid shape. I noted a stock of more than one thousand hydrangeas in frames soon to be brought in. These are used largely for boxes, etc., at the seaside resorts principally.

Fred. C. Becker has sold clean out of azaleas. He did not carry any late flowering varieties. Could easily sell a duplicate of those well grown pretty plants he had at Christmas. He has a capital batch of lilies and Nephrolepis

(Continued Page 744.)

WANT ADVERTISEMENTS.

SITUATION WANTED—By a thoroughly practical gardener and florist to take charge of private or commercial place where wages would be commensurate with results; responsible references. Address A. M., care of Florists' Review, 56 Pierce Bldg., N. Y. City.

WANTED—A first-class grower who knows enough to run a place on business principles, to buy one-half interest and take full charge; must thoroughly understand the business. If dissatisfied with his purchase any time within one year he can have his money back. For particulars address A. H., care Florists' Review.

SITUATION WANTED—By a gardener; German, 31 years old; married; 16 years' experience in flowers, fruits, vegetables. care of pleasure grounds, hothouses, and landscape gardening; position in private park, cemetery, or gentleman's place in city or country; best of recommendations. Address A. Daum, 187 E. Chicago avenue, Chicago, Ill.

SITUATION WANTED—By a florist and gardener; single; 15 years' experience; who can grow carnations, mums, violets, roses. etc.; also vegetables under glass; best of reference. Address A. H. Clark, Lansdale, Pa.

SITUATION WANTED—Where first-class stock is grown; best of references from past and present employers; age 24. State wages, etc. W. D., care of W. W. Cole, Maple Hill Rose Farm, Kokomo, Ind.

SITUATION WANTED—As foreman or grower on commercial place, unquestionble ability in all branches. Reliable, industrious and capable of assuming entire charge. R. G., care of Florists' Review.

WANTED—Florist, immediately; wages $15 per month, board and washing; general work. L. Cottle, 622 64th av., Oak Park, Ill.

TO RENT—Five greenhouses, and material enough to build another; 3,600 feet of glass, well stocked, an acre or so of land, and four-room cottage- Will rent to a desirable party as low as $25 a month. A splendid opportunity. To rent on account of death of Mr. Saxon. Address Mrs. A. H. Saxon, Downer's Grove, Ill.

WANTED—Capable man to take charge of a retail florist's store in Chicago. Must thoroughly understand making up. Address D. J., care Florists' Review.

SITUATION WANTED—By practical florist with 15 years' experience in growing cut flowers. Specialist in roses. State wages paid. Address F. Campbell, 355 Ellicott Square, Buffalo, N. Y.

SITUATION WANTED— First-class cut-flower grower; 12 years' experience; single; 28 years; extra good rose grower; best of reference; wish employment at once. Address, stating wages, T. E. Gleason, 95 E. 26th St., Chicago, Ill.

FOR SALE: 1 dwelling house, 2 greenhouses, 17 x 150 newly built: well located and good home trade, on st. car line and near a city of 300,000 population. For particulars address P. O., care Florists' Review.

SITUATION WANTED—By married man, as rose grower or foreman: good grower of cut flowers and general greenhouse plants; first-class references; state wages. R. W., care of Florists' Review.

SITUATION WANTED—By a first-class all round florist; good grower of roses, carnations, violets, and mums, general stock, etc.; 16 years' experience. F. S., Florists' Review.

SITUATION WANTED—As foreman by an up to date rose and cut flower grower; good manager and hustler and can furnish best of references as to ability to fill a first-class position. Am open for an engagement at any time desired. Give full particulars when writing. Grower, care Florists' Review.

A FIRST-CLASS MAN is now open to engagement; fully competent in every respect; expert grower of both plants and cut flowers; wants an opportunity to better himself; no object to change unless there is an opportunity for him to show his abilities on a scale that will make his services worth at least $75 a month. Address S. D., care Florists' Review, Chicago.

SITUATION WANTED—By a first-class grower of roses, carnations, violets, etc.; 12 years' experience and can furnish best of references. Address Practical care Florists' Review.

SITUATION WANTED—By experienced gardener: single, 25; in private place; understands care of greenhouses, fruits, everything in general; best of references; California preferred. Address P. Hanson, box 251, Mamaroneck, N. Y.

WANTED—Young florist for store and greenhouses. H. F. Halle, 548 W. Madison st., Chicago.

SITUATION WANTED—By A1 grower of roses and other cut flowers and plants, as working foreman; has held similar positions in Chicago; best of references; disengaged April 1. Address E. C., care Florists' Review.

SITUATION WANTED- By man of ability in all branches of business. Add. E. C., Florists' Review.

SITUATION WANTED—By a first-class florist; single, German. 36 years of age, with 20 years' experience in growing roses, carnations and general stock; can furnish best of references. H. C., care of Florists' Review.

FOR SALE.

Established florist business and greenhouses. Fine stock of all plants and roses and carnations. Everything in first-class condition. City water, steam heat, etc. Pleasure and health resort of 5,000 people in Indiana. No competition. A big bargain for some one if taken at once. One-third cash, balance to suit purchaser. Speak quick. Address MEXICO, care Florists' Review.

For Sale. A Bargain.

Six Greenhouses, well stocked, nearly new, together with two fine dwelling houses, barns and 35 acres of land, consisting of all kinds of soil. Six miles from Milwaukee. All buildings nearly new. Nearly $7000 insurance carried. The land alone is worth the price asked. Reason for selling, failing health. Address or call

H. STAEPS, ELM GROVE, Wis.

Bostoniensis of which he has about six houses planted for later sales.

F. L. Foster has a big stock of the Boston fern which is as much in favor as ever.

Warren Ewell is usually approachable but has no time just now for interviewers. The enormous quantities of bulbous stock demand his close attention and 'tis going well judging by his complacent smile. "Just tell them that you saw them" and how they look. I think there will be enough to go around.

James Quinn must be included among the bulb growers. He forces a large number for his own retail trade. With a record of not yet having wasted a flower, and prospects of a splendid lot for Easter, he is well pleased with the situation.

F. E. Palmer has a strike with an all-round well-grown Easter stock and a heavy rose crop in view.

I met Mr. Nicholson, from near-by Framingham. He tells me he will have a heavy cut of carnations at Easter. His stock needs no introduction here.

Miss Vass maintains the excellent reputation of her establishment. She has a well-grown stock, which we expect to see depleted around and about the 10th.

Alex Montgomery will cut enormous cuts of roses from the Waban houses. Other growers will also be in excellent trim, so that there will be no lack of supply.

The stores already have an Easter appearance. Galvin's is ornate with conservatory filled with the choicest stock. Doyle's windows are very attractive, a handsome specimen of Cibotium Schiedei standing in center; its far-reaching, most graceful fronds, spreading over the flowers arranged beneath, have a charming effect. Houghton & Clark, Delay and Grimmer vie with each other in producing effect. Norton Bros. make an attractive display. Jas. Rough and C. R. Dane are right in line at their uptown stores.

At the Public Gardens, Mr. Doogue will give an Easter display, which should help boom the business. Among the small (?) items for use in adorning the gardens this season are 25,000 hydrangeas and 15,000 hybrid roses.

GRAND RAPIDS, MICH.

Supply and Demand.

There has been lately as many changes in the weather as colors in Joseph's coat; first cold, then hot, then wet, then the combination, with a sickly attempt on the part of Old Sol to smile approval on all. The push cart and peddler wagon, sure harbingers of spring, once more make their customary rounds with spring bulbs, callas and flowering plants, at prices that make the store man groan.

The demand is still in excess of the supply, and as yet there has been no lull in business. Indications of Lent show this to be the busiest Lent ever known. Flowering plants in pots are now beginning to move lively; everyone seems to want something in flower for the window.

Notes.

Henry Smith has rented a store on the corner of Monroe and North Division, which he is remodeling and fitting up in first-class style. Henry will now have the finest store in town, with a total frontage of forty feet, and it will make the rest of the stores hustle to keep their pace.

Mr. B. B. Blair, late with T. R. Renwick & Co., has accepted a position with F. J. Meech, of Charlevoix, Mich., and Frank Burckie, of Chicago, takes Mr. Blair's place at Renwick's.

H. D. Bayers, with the Dayton Paper Novelty Co., was in town the past week, boxing orders, of course.

A large dry goods store gave away 500 roses to its customers the latter part of the week, and more are expected to follow the good example set.

The contract for the cemetery bedding has been awarded to Crabb & Hunter; geraniums at $6 per 100; the alternanthera lettering at $1.75 per letter. Paul Goebel & Son get two geranium beds, same rate.

HUNT'S REVIEW OF THE CHICAGO MARKET.

Things generally have brightened and buying, both local and country, has been fairly active, with some few heavy orders on at fair prices.

Receipts shortened somewhat, bulbous stock perceptibly decreasing. Valley very scarce, as is Harrisii of good quality.

Smilax in great demand, with but limited supply.

Carnations coming good quality, but still somewhat shy in quantity.

Roses of all sorts good. Advance orders and inquiries indicate a healthy feeling and a hopeful tone.

Easter trade is predicted to break all existing records for past six years. The scarcity is guessed to be on carnations, with Harrisii a doubtful quantity.

CORRECTION.

The item in our notes from Grand Rapids, Mich., in last issue, to the effect that Chas. Bowditch is now traveling for Henry A. Dreer, of Philadelphia, was an error.

J. M. LOGAN,

Landscape Architect and Gardener

Plans furnished and estimates given.

White Plains, N. Y., and
114 Chambers St., New York City.

ROOTED CUTTINGS OF CARNATIONS:

New—Mayor Pingree, Victor and Flora Hill per 100, $5.00; per 1000, $40.00. Jubilee and Emma Wocher, per 100, $3.00; per 1000, $25.00. Meteor and Tidal Wave, per 100, $2.00; per 1000, $15.00. Scott, Daybreak, Albertini, Alaska and Puritan, per 100, $1.50; per 1000, $12.00. All well rooted. Satisfaction guaranteed or money refunded.

REINBERG BROS., 51 WABASH AVENUE, CHICAGO.

BUFFALO.

Favored with a first-class commission house and some of the best growers of the Union, it would indeed be singular if stock of extraordinary quality were not produced and disseminated. This is so, and Easter will find the craft prepared to handle all that comes along in the shape of orders. Rebstock's azaleas, Palmer's carnations and immense bulbous supply, Scotts' immense assortment of pot-grown stock, which is in excellent condition, in addition to the numerous smaller blocks around and well grown by Keitsch, Burton and Belsey. Mrs. Newlands will have as usual plenty for her cemetery clientage. Christensen's fine fuchsias are missed this year, but we shall doubtless see him to the front another season. Chris. is not the man to retire from active life. All will be pleased to welcome him into the arena again. W. M.

HAVERHILL, MASS.—C. H. Kaulbach is a candidate for hail insurance, provided there is provision for snow drifts, one of which caught him in the storm of January last, whereby he lost more than 1,000 panes of glass in addition to loss of stock through the severe frost following and before the damage could be repaired. Consequently he lost much stock that would be in shape for Easter, but notwithstanding this his philosophical nature cheerfully anticipates a good trade around the 10th, which we also wish him.

LAWRENCE, MASS.—J. B. Halley was examining a big batch of Easter orders when I called, and predicted a flourishing time. He is prepared to meet it, with Chas. N. Wingate, whose stock is at par.

Burpee's Seeds Grow

PITTSBURG.

Exhibit of Florists' and Gardeners' Club.

The most noteworthy event of the week was the carnation exhibit and discussion of the Pittsburg and Allegheny Florists' and Gardeners' Club, at their last meeting night, Thursday evening, March 24th.

The display of Messrs. H. Weber & Sons, Oakland, Md., was the largest and best. They exhibited the following carnations: Mrs. Geo. M. Bradt, Flora Hill, Mayor Pingree, Mrs. McBurney, Hector, Armazindy, Triumph, Buttercup, Eldorado, Uncle John, Jubilee, Daybreak, Della Fox and a lot of unnamed seedlings; also a sample lot of their new rose, Mrs. Robert Garrett. These blooms received many comments.

Mr. Fred Burki displayed a choice lot of Hector with immense blooms and exceedingly long stem; his Buttercups and Mrs. G. M. Bradt blooms were much praised.

Gustav Ludwig exhibited the following grown by Mr. John Murchie, of Sharon, Pa.: Wm. Scott, Daybreak, seedlings, a fine pink of Rose Queen and Peach Blow, a white of Storm King and McGowan, a red named Uncle Walter, a spray of Dendrobium fimbriatum oculatum, which was much admired. A bunch of Mr. Murchie's yellow Marguerite Etoile de Lyon, flowers measuring three inches in diameter, with a long, stiff stem, was much admired.

Vases of Allium Neapolitanum, Bride and Bridesmaid roses grown by Chas. Hoffmeyer, of Carnegie, added much to the appearance of the display.

Wm. F. Kasting, of Buffalo, N. Y., sent a sample lot of the famous Genesee, three new unnamed seedlings, sports of Scott and Daybreak. These were exhibited by Langhans & Co., Allegheny, Pa.

E. C. Ludwig had the finest lot of Albertini, with immense blooms and rigid stems three feet long. A vase each of Daybreak, Flora Hill and Brunners was included in Mr. Ludwig's exhibit. Mr. H. D. Roher, of Lancaster, Pa., was the grower.

Judging from the general interest taken in this exhibit, it is probable that Pittsburg will have a fall flower show.

Among the visitors here last week were Messrs. H. Weber, of H. Weber & Sons, Oakland, Md.; J. McHutchison, representing Aug. Rhotert, New York; A. Colijn, of C. Colijn & Sons, Holland.

Just at this writing your correspondent has been advised of several elaborate floral memorial design orders for the late Lieut. Jenkins, the Maine hero, who is to be buried here March 30th.

THE REGAN ... PRINTING HOUSE ...

Nursery Seed & Florists' Catalogues

87-91 Plymouth Place, Chicago.

CINCINNATI.

Business has been very quiet for several days. Transient trade is poor and very little is going on to create a demand for flowers. If there was any business to speak of, we would be short of stuff, for a week of rainy weather and an effort on the part of the growers to hold back their stock for Easter has decreased the supply of roses and carnations to such an extent that there is hardly enough coming in to supply the light demand. Trade was slow at the Sixth street flower market on Saturday, owing to disagreeable weather.

This locality was visited by a heavy downpour of rain several days since, which has done great damage. Washouts on the different railroads have made the shipping of flowers a risky thing, as very few trains are running on schedule time. The Ohio river is on a rampage and several of the craft are in the flooded district. Fred Walz, K. Wolf and Benj. Glins, of Cumminsville, are among the unfortunate ones.

I am in receipt of a letter from W. G. Matthews, of the Dayton Floral Co., stating that his loss from the flood is fully $3,000. His greenhouses were entirely covered with water for two days, destroying his Easter stock of hyacinths, tulips, and lilies, which were in bloom. Mr. Matthews said that he only had about ten minutes' warning of the danger, and that most of his property was swept away by the powerful current.

George & Allen, of Hyde Park, and Henry Schwarz, of Price Hill, both lost considerable glass by hail. In Camp Washington and Cumminsville a number of truck gardens were washed out and considerable damage was done.

As everyone knows, there is quite a large pond on George & Allen's place, which is quite an attraction for wild ducks. While going about his work Ben always carries a shotgun with him, but not being a very good marksman, his vigilance has been in vain. However, an accident occurred last Sunday, and Ben brought down one of the birds, which made a good, square meal. What a pity it is that he hasn't a gun like Scott, for then he might be able to hit something. As it is, he sits up half of the night with two or three lanterns, looking for more ducks.

Recent callers were: Paul Berkowitz, Philadelphia, and O. J. Friedman, Chicago. B.

THE MORRIS FLORAL CO., Morris, Ill.

DWARF PAPAYAS.

MOST magnificent Bedding and Decorative Plant ever introduced; equal to a Palm in beauty; grows with the rapidity of the **Ricinus;** not affected by drouth. Plants from 4-inch pots, set out 1st June, attained a height of ten feet, and though not watered once, remained fresh and vigorous during the extreme drouth. Send for half-tone illustration showing bed of these plants. Every Florist should have it. Price to the trade $2.25 per doz. for 3-inch pots; all propagated from a tree which has produced this Fall and Winter 192 pounds of its delicious fruit, the largest weighing 12½ pounds.

TARO PLANT.—The genuine Sandwich Islands Taro, entirely distinct from the common Caladium, and a much grander plant in all respects. $1.00 each. Ready May 1st. **Send for Catalogue.**

MARTIN BENSON, Dongola, Ill.

GERANIUMS—Grand Bedders and New. 40 var., $1.30 per 100, $10.00 per 1,000. **Alternanthera**—P. Condition of the Market.

Trade is good—not booming, but the market has a healthy tone, and complaints of "poor sales" and "hard times" are seldom heard from either growers or store men.

Stock is of good quality, with a fair supply; about equal to the demand. There is a disposition with most growers to hold everything possible for Easter. Bulbous stock is thus being held, the supply at present being somewhat short. The supply of Easter stock is somewhat problematical, though most likely large enough for the demand, excepting Harrisii. The small number planted and the havoc wrought by the disease have reduced the visible supply, and prices are likely to rule very high at the near approach of Easter.

Smilax is scarce, while the future supply is uncertain. Early in the season this article was very plentiful and cheap. Carnations will also be scarce for Easter. Roses and violets will be in fair supply.

Advance price lists quote roses for Easter at retail, $2 per dozen; carnations, 75 cents; violets, $3 per 100; Harrisii, $3 per dozen; valley tulips, Narcissus, and other bulbous stock, 75 cents per dozen.

MESSRS. LANGHANS & CO., of Allegheny, Pa., are issuing some very attractive printed matter to their retail customers. A specimen pamphlet just received is entitled, "Flowers and Floral Decorations for the Easter Season," and ought to prove a very effective, seasonable advertisement for this enterprising firm.

WM. MURPHY, Sta. F, Cincinnati, O.

Use Economy and Make Your Own Pots

THE COW MANURE POT is the best in the world for young plants. For bedding and sending of plants it is the best thing ever invented. The cow manure forces the plant and makes it healthier. You do not need to disturb the roots in getting them out as you do in the clay pots. It is especially recommended for the sending of plants, as the plant does not have to be taken out of pot. For bedding all you have to do is to squeeze the bottom of pot and set out in bed. It never stays the plant, it holds the moisture better, especially if you have a dry summer. The pots stand watering in greenhouse and hotbed. Every gardener needs one of these machines. Single machine, 2-in. pots, $4.50. Double machine, 2 and 3-in. pots, $5.
Machine weighs about 5 pounds.

WATERING PLANTS IN JADOO.

We hear of some failures of plants in Jadoo from overwatering. It should be borne in mind that the Jadoo is more retentive of moisture than soil, and this characteristic should not be overlooked in watering.

A LOST LETTER.

Will the party in Terre Haute, Ind., who answered the adv. of Boston please write again, as his first letter was accidentally lost. Address Boston, care Florists' Review.

NORTH CAMBRIDGE, MASS.—Wm. A. Bock has a remarkably fine lot of Easter lilies, the finest around Boston. They are from Japanese bulbs and are perfectly healthy. His spiraeas, hydrangeas and other plants are also looking well.

HARTFORD, CONN.—The premium list of the Connecticut Horticultural Society for 1898 has been issued, and copies may be had on application to the secretary, Mr. C. M. Rodgers, Beacon street, this city. The society will hold exhibitions in June, July, September and November.

BIRMINGHAM, ALA. — Mrs. H. A. Lindsay has purchased a conveniently located tract of land containing seven acres, upon which will be erected a new range of greenhouses, covering about 12,000 square feet, all to be of modern, up-to-date construction. The old place has become much too small for her growing trade. During the coming year Mrs. Lindsay will celebrate her tenth anniversary as a florist and will suitably commemorate the day. The Birmingham News of March 14 prints an extended and very eulogistic description of her establishment and ability as a florist.

Grand New Violet "La France."

STRONG VIGOROUS GROWER.
EXTRA FREE FLOWERING.
RICHEST COLOR.

Of the many new Violets introduced in the past few years this, the latest introduction of the foremost French specialist, is unquestionably the **BEST.** It has been thoroughly tested by Mr. Supiot, the Violet expert, who pronounces it "perfect," and flowers which we have exhibited during the past few weeks have been much admired. In vigor of growth, freedom of bloom, and in size and coloring it is superior to all existing sorts, and will soon supercede them. Only a limited stock will be offered this season, and orders will be filled in strict rotation

Price, $1.25 per dozen; $10.00 per 100.

MR. P. VOS.

Last year it was erroneously reported in an American trade paper that Mr. P. Vos, the well known Holland bulb grower and dealer, had failed in business, and much regret was expressed by the many friends made by Mr. Vos during his ten annual visits to this country. The only basis for this report was the fact that Mr. Vos had merged his business in the new Holland Bulb Co. last July, with headquarters in Oegstgeest, Holland, in which was also combined the business of Mr. G. C. Vanderhoef, a large bulb grower.

Mr. Vos was at a loss to understand how the erroneous report originated, but he has now learned that after returning home from his American trip last year a competitor in business sent letters to some of his customers here, saying that he had failed and suggesting that the orders placed with him be transferred to them. Mr. Vos has shown us one of these letters, of which he has succeeded in getting possession, also a statement from the proper authorities in Holland certifying that he has never passed through bankruptcy there.

Mr. Vos is now on his annual American trip, and proposes to make things warm for the competitor mentioned upon his return home. He reports business as very satisfactory.

PALMS IN THE WEST.

Mr. Geo. Wittbold, Chicago, has always been a great lover of palms. Not so many years ago Mr. Wittbold was the only florist in Chicago who could supply a sufficient number of palms to make a decoration. Now there are few florists with greenhouse facilities that do not carry a stock. But in the meantime Mr. Wittbold has continually increased his stock, and he has still much the largest stock in the west. Where he formerly had a few houses of "palms," he now has a "few houses" of each of the important commercial sorts. The increased demand for palms during the last decade is certainly phenomenal.

HAIL NOTES.

The greenhouses of Henry Schwarz, of Price Hill, Cincinnati, were struck by a hail storm on the 16th inst.

B. Heshon, of Lawrence, Kan., and the Junction City Floral Co., of Junction City, Kan., also met with slight loss recently by hail. All of the above were insured.

In order to compile correct statistics, the secretary of the F. H. A. desires information concerning hail storms, their location and amount of damage done. Every florist is invited to drop a line when a storm occurs. Address John G. Esler, Saddle River, N. J.

Extra select stock at Kennicott Bros. Co., Chicago. All flowers in season at lowest market rates.

WE HAVE PLEASURE IN OFFERING TO THE TRADE THIS SEASON FOR THE FIRST TIME ONE OF

The Finest Novelties in Chrysanthemums

EVER SENT OUT

...MRS. O. P. BASSETT...

It will only be necessary for us to state that **This is a Yellow Mrs. Henry Robinson**

to ensure for it a large sale. It is a sport from Mrs. Henry Robinson, with which variety it is identical in every respect except color, being a delicate primrose yellow, deepening toward the center of the flower. It has been thoroughly tested, and is a novelty of sterling merit. One of the most eminent eastern growers who has tested it states that it is one of the best things in Chrysanthemums sent out in some time. Every Chrysanthemum grower will want it. **A Yellow Mrs. Henry Robinson** will be a money-maker, and a fine exhibition variety as well. Plants now ready for delivery. We have also fine stocks of the other finer introductions of the year—**FRANK HARDY, MRS. H. WEEKS, AUSTRALIAN GOLD.**

Price, $3.00 per dozen; $20.00 per 100.

Wm. H. Chadwick, $6 per doz. The Yellow Fellow, $3 per doz. Pennsylvania, Autumn Glory, Solar Queen, Black Hawk, Quito, Thornden, $5 per doz.; $35 per 100. Boundless Snow, Mrs. C. H. Peirce, Miss Gladys Vanderbilt, $3.50 per doz.; $25 per 100.

We offer also all the best of the **Novelties for 1897,** and the **Best Standard Sorts.** Send for our wholesale list and large descriptive catalogue, giving full list of varieties and prices. We have a very large and fine lot of Novelties in Cannas for 1898, also best and latest introductions in Carnations, Dahlias, Strong Field-grown Roses and other Hardy Plants, a large and fine collection of Palms and other Decorative Plants, etc., etc.

We will be pleased to send our wholesale list and descriptive catalogue to any one who may not have received them.

Trade Conditions.

Trade conditions during the week past were after all much better than we anticipated at last report and but very little stuff went to waste. A large amount of funeral work helped materially to increase the bulk of business over the average. The supply in all lines was very abundant every day and with only the ordinary demand much of it would have remained unsold, as was the case the week before, but happily, conditions changed and growers as well as retailers are well satisfied with their sales. The warm weather is still with us bringing out flowers of all kinds faster than they are desired, but the quality is very good with perhaps the exception of house grown violets, which are losing color and diminishing in size; but those planted in cold frames are in excellent shape now and there is no reason why they should not continue so for some weeks to come if slightly shaded on bright, sunny days.

Easter Outlook.

Many of the hyacinths in the open ground are ready to be cut now. This is the earliest date of such an occurrence for this latitude within the remembrance of the writer. We had such a most remarkable winter and now we are experiencing such extraordinary spring weather, which baffles attempts of our growers to retard Easter stuff, especially such things as azaleas and genistas; much of this stock if not the majority is too forward now and will not be in marketable condition for Easter. The supply of lilies will be short from present indications and those offered will command higher prices than we were able to obtain for some years past. Hydrangeas are superior to those offered usually so early in the season, not in size of plants or flowers, but because the texture of foliage and flower is much harder, the result of the prevailing bright sunny weather. They are thus not so apt to wilt down in the drier atmosphere of a dwelling house and will therefore be more satisfactory to the buyer.

A limited quantity of excellent sturdy and very profusely flowered cyclamen have been kept back successfully for the Easter trade by Geo. J. Keller. His remarkable success is attributed to his well ventilated violet houses, where he kept these plants practically at a standstill during the winter months. All the buds seem to be eager to start up at once with the greatest vigor as the season advances and they are just right for Easter week.

NOTE—

I fully expected to show in this issue the cuts of my new sectional Heater, for hot water or steam, but am sorry to say the engraver has disappointed me, and it cannot be done. However, I would respectfully ask you to look out for them next week, and I will see that they show up in time. The boiler I shall show is sectional in every part. and each section can be removed and replaced without disturbing any other part of the boiler. This cannot truthfully be said of any other sectional boiler in the market.

CARNATION WHITE CLOUD.

I visited Mr. Dorner's establishment at Lafayette a few weeks ago and must say that the photograph in the last issue of The Review does not do justice to the bench of White Cloud. The bench, as I saw it, was the finest bench of white carnations I have ever seen. White Cloud is, to my taste, the most perfect, best shaped and finest white carnation I have seen yet.

AN UNPARALLELED SUBSCRIPTION OFFER.

EVERY one to whom this issue of the FLORISTS' REVIEW is addressed, and who fills out, signs and returns the accompanying subscription blank, accompanied by $1.00, within 30 days from date, will receive not only the FLORISTS' REVIEW for one year but also a certificate entitling him to the earnings on one-tenth of a share of stock in the company formed to publish the paper. The shares will be of a par value of $10.00 each.

Why do we make such an unparalleled offer? It is very simple.

You will have an interest in the success of the paper.

You will see that you can buy everything that you want to just as good advantage from advertisers in the FLORISTS' REVIEW as elsewhere and at the same time benefit yourself by increasing the earning power of your certificate.

This mutual arrangement cannot fail to bring to the paper a heavy advertising patronage, and as a result the stock represented by your certificate will earn good dividends.

And the more you buy of advertisers in the FLORISTS' REVIEW (always mentioning the paper) the larger your dividends will be.

You will get a better paper than has yet been published in this field, and a share of its earnings. Please let us hear from you by early mail.

THE WEEKLY
FLORISTS' REVIEW

COPYRIGHT, 1898, BY
FLORISTS' PUBLISHING CO., 520-535 Caxton Building, CHICAGO.

Vol. 1. CHICAGO AND NEW YORK, APRIL 7, 1898. No. 19.

MICROLEPIA HIRTA CRISTATA.

Several of the microlepias may safely be listed among the useful ferns, the members of this sub-genus in general being not only graceful and pretty, but also quite easy to manage.

Microlepia Hirta Cristata.

The special subject of our note, M. hirta cristata, is a free growing fern of very graceful habit; its long, drooping fronds being finely divided and the tips much crested. The stems are quite downy, and inclined to straw color, though varying somewhat according to the condition of the plant, and the whole frond is soft to the touch, being more or less downy throughout. But for all the softness of the foliage of this fern, it will bear quite a good deal of exposure, providing the plant is abundantly supplied with water, but if allowed to get thoroughly dry once or twice its usefulness is gone for a time at least. As an exhibition plant this fern is excellent, its pale green fronds being very effective, and in a good specimen the pot or pan in which it is grown will be almost entirely veiled by the abundant foliage, a plant 5 to 6 feet in diameter having been grown in a 24-inch pan. M. hirta cristata flourishes in a temperature of 65 degrees and also enjoys a rather strong soil, sandy loam with a liberal quantity of dry cow manure giving a good result.

As this plant is not a very deep rooting species, pans are preferable to pots for large specimens, and these should be well supplied with drainage. The usual method of increasing the stock of this fern is by division of the crowns, the latter being so multiplied that a large number of young plants may be secured by careful division, and these divisions being potted up into small pots and kept rather close for a time, will soon start away.

Spores are produced but sparingly until a plant attains considerable size, and consequently are not depended on to the same extent as division.

W. H. TAPLIN.

OUR LONDON LETTER.

[From our London Correspondent.]

Spring is dawning again in the British Isles as these notes are being written. Crocuses give glints of brilliant color to the London parks and the grassy slopes of the Royal Gardens, Kew, where during the past few years hardy plants have been grouped and massed in effective ways. The past winter has been phenomenally mild, almost summer-like in its warmth and sunshine, but a cold snap in late February fortunately checked the opening buds.

A Splendid New Anthurium.

This is a delightful acquisition to the many fine anthuriums in our gardens. It was shown by Sir Trevor Lawrence, Bart., at the February meeting of the Royal Horticultural Society, and has large, bold, shining spathes of a salmon-red color, a pleasing and uncommon shade. It is not one of those

hybrid kinds praised too often for their singularity rather than decorative value. This kind will, no doubt, become the anthurium of the future. A first-class certificate was awarded to it by the floral committee.

Azalea Grandiflora Alba.

This is another remarkably useful azalea. Its flowers are snow-white and nearly eleven inches in diameter. The plant shown was not very strong, but one can scarcely judge of its vigor from a single example of a new kind. It is, however, evidently very free-flowering.

The Great Quinquennial Show at Ghent.

British nurserymen are looking forward to this exhibit, which takes place once in every five years in the famous Ghent city of Belgium. This year it promises to excel previous shows, but that is a bold statement. It must be difficult to eclipse the glories of 1893, when the groups of rhododendrons, and in particular azaleas, created splendid masses of color. But this exhibition does not equal in interest and variety the Temple shows of the Royal Horticultural Society.

New Orchids.

I should require many columns to describe the new orchids that are shown during the course of the year in the various exhibitions. Hybrids increase and multiply, but I must mention that a glorious variety of Odontoglossom Wilckeanum called Pittae, was exhibited recently. The blotching of brown on the rich yellow ground was very rich. Baron Schroeder, of The Dell, Egham, showed a gem amongst Odontoglossoms, a variety of O. Crispum named after Baroness Schroeder. The flowers were of intense coloring, almost suffused with deep blood crimson, with white tips to the sepals and petals. The baron has probably the most valuable collection of orchids, varieties of Odontoglossom crispum in particular, in the world. Perhaps I may some day write you about these treasures.

SIMPLE FLORAL ARRANGEMENTS.

A Cluster of Hyacinths.

When the florist must provide a number of lots of flowers to be used for the same occasion, it is well to avoid repetition, and to make the contributions show as much tasteful and pleasing variety as possible. For this purpose the various shades of hyacinth flowers may be used to advantage, during their season, and are much liked by certain flower-buyers.

Their stems are brittle, and the spikes of flowers heavy; consequently they need care in arrangement, and a good stiff backing to properly support the flowers. Some of their own foliage should be allowed to show, and the thick, soft stems should not be too evident in the finished piece.

The illustration is made from a photograph of a very large cluster of purple and porcelain-colored hyacinths, on a backing of dicksonia fronds, finished with adiantum, and a bow of purple ribbon, and with card attached.

W. T. BELL.

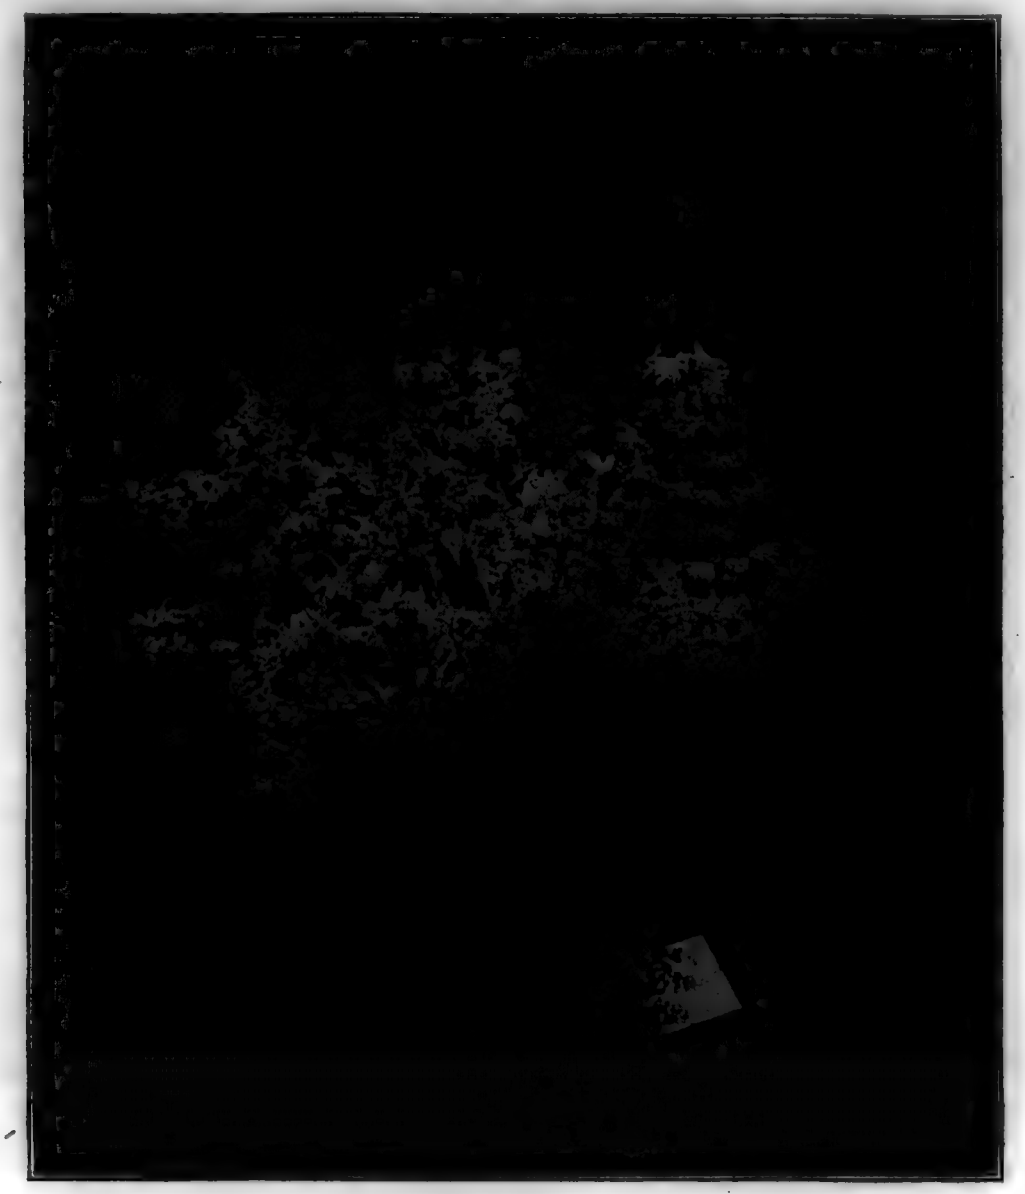
CHRYSANTHEMUMS

CHRYSANTHEMUMS.

[From advance sheets of the Florists' Manual, by William Scott.]

For a hundred years the chrysanthemums have had periods of great popularity and then of neglect. Perhaps it would be safe to say that with the American public the tide of present popularity is not just at the flood and the craze of 10 years ago has slightly subsided, yet not to any great extent. There is no longer a dozen firms each sending out a new set annually at Klondyke prices, for which we must be devoutly thankful. An aspirant for public favor now must be about perfect and a slight advance on preceding kinds. A few new ones each year is an abundance and even those are offered at a price that allows us to give them a trial. We do not believe that chrysanthemums will ever drop from public favor, as say for instance the camellia, for it has many noble attributes to make it annually welcome. The perfection to which they are now grown is something former generations knew nothing of and the flower-buying public of 30 years ago was so insignificant compared with today that it could be truthfully said to be non-existent.

The commercial florist is interested mostly in the cut blooms and to a much smaller extent in a medium sized plant in a pot. Cultural directions for both will be found below. The standards and large specimens are left to the private gardener who has time, money and space.



A Commercial Flower.

Take note during flowering season of varieties wanted for your next season's crop and remember that if few varieties are grown it simplifies labor and expense, and there are so many to choose from that color, form and season can be all covered by varieties that you have found easy to grow. Select plants for future stock that have produced the best flowers, marking them before the flowers are cut. Lift sufficient plants and place them in flats, keeping them after first watering rather on the dry side in a cool house until time to start them growing to produce cuttings. Do not use any weak shoots for cuttings. Throw them away, it will afford room for the stronger to develop. Chrysanthemums root readily in sand or finely sifted coal ashes in an ordinary propagating bed until end of May or early June. After that date you will be more successful with a bed in a cold frame, shaded with cloth, lath or shaded glass tilted back and front to insure a free circulation of air; and the bed must be kept copiously watered; this is very important. You often see chrysanthemum cuttings drying and wilting in June and July. They have been allowed to get dry or the sun has been shining on them, so water copiously twice a day in fine weather.

The best time to propagate varies with the different varieties and the size of flowers wanted. For large, long stemmed flowers of early varieties, such as Ivory, Bergman, Bonnaffon (Bonnaffon can be grown early) and other dwarf sorts, February is not too early to put in the first batch. From that time on propagating can be continued until August. For late flowers, many of the free growing varieties do well and produce fine flowers on side benches from late cuttings. Those propagated as late as August can be planted on the benches direct from propagating bed without any potting, and will grow from the start if kept sprinkled and shaded for a few days during the hottest hours of the day. Earlier rooted cuttings that have to be potted will want a 2 or 2½-inch pot. Let them be well rooted before potting. Use a moderately heavy soil and not too rich. When well hold of the soil in the pots a side bench of a carnation or violet house will suit the young plants of most varieties finely, always giving them as much air as possible and room to grow without drawing up. The earliest struck batches will require a 3 or 3½-inch pot before planting out time. Some of our finest varieties which have a tendency to produce a flower larger than the stem can hold erect will be greatly benefited by having 3 or 4 weeks out of doors before planting on the bench. Such varieties which are weak necked should be grown slow and hard wooded and should never from the time they are rooted be allowed to attain a soft, rank growth.

The early varieties should be planted on benches in four inches of soil; raised benches with good drainage will enable you to control the growth and ripening of the wood. The late varieties are all right in solid beds, providing the texture of the soil and drainage is right.

A heavy, free loam that the water

A Cluster of Hyacinths.

SIMPLE FLORAL ARRANGEMENTS.

will pass through freely, with the addition of one-fifth of rotted cow manure and a liberal sprinkling of pure bone flour will be an excellent compost. A "liberal sprinkling" is rather indefinite, so I will say one pint to a bushel of soil can be used safely. If it were mixed with the soil a month or two months before planting, so much the better. The chrysanthemum is called a free and even rank grower, but over rich soil produces very large soft flowers. The flowers produced on a soft forced growth are in poor condition to withstand the handling they have to undergo before they reach the retail counter and to produce durable, firm flowers a well matured growth of the wood is as necessary as is a good dry house and abundance of fresh air.

This unnaturally stimulated growth may not be the whole cause of the rust, which is fatal to some of our best varieties, but it is certain that it renders the plant in an excellent condition to be attacked by the disease. The rust usually appears in September and later when there is promise of great flower buds. It is then that we are subject to great changes of temperature; if the growth is soft, produced either by too rich a soil or too much water at the roots or even too much moisture in the house, produced by water not draining off freely under the paths and benches. That grand variety Golden Wedding has been grown in the neighborhood of Buffalo since its introduction. We hear of its failure in many places, but where there is no stagnant water in the house, and the roots have received it sparingly, and planted in a soil that water passes freely through, I have not seen a vestige of disease on it. This grand golden yellow will hold its own with any new varieties, particularly when the grower will learn to withhold water. It cannot be done right in a soil that the water does not pass freely through. To sum up this particular point, encourage a free growth till buds are selected, then gradually withhold water which matures the wood and assists bud formation. To the inexperienced let me say that no serious check in growth must be given but merely less water than formerly, which will firm the growth.

For early varieties, where crown buds are used, care must be taken not to resume free watering until the buds are well formed, otherwise we will not get perfect flowers, but many unsalable ones. After the buds are well formed the judicious use of animal manure, either in the shape of a mulch or liquid, is safe and beneficial. I prefer to apply in a liquid form, as we can keep better track of the condition of the soil.

While a free circulation is at all times necessary as well as keeping the house dry, from the time the buds show color till the flowers are cut, a gentle fire heat should also be put on as soon as we get cool, damp weather and the ventilators kept open day and night as long as possible. A sprinkling of air slaked lime at intervals through the growing season under the benches and walks will keep the atmosphere sweet and help the plants.

The chrysanthemum is afflicted with most of the plant enemies we have to contend with. The black, yellow and green aphis can be kept down with a moderate but regular smoking, but make sure to clear them of all aphis before the buds are far advanced. Thrip and red spider sometimes make their attacks during hot spells, but can be kept down by a proper use of the hose.

When the young plants are set in the soil of the bench give them a thorough watering to settle the soil around the roots. Plant all varieties firmly. For tall growing sorts inclined to weak stems, a uniform pounding of the soil after the plants have made new roots will make the root action slower and stronger and the stem will be correspondingly stronger and shorter jointed.

Be always very careful when watering, particularly with the early varieties, and a good look over the bench before you begin will let you be aware of spots in the bed that may go another day or two. I have often noticed that where all parts of the bench were watered alike, the outside rows came into flower considerably earlier than the interior plants. The outside rows getting more light and air dry out quicker, thus hastening bud formation. By care in keeping the bench at an even degree of moisture you can bring in a crop evenly, which is a consideration both as to price you get for your flowers and your ability to clean up the bench for succeeding crops. Syringe during the growing season once or twice a day, as the weather may require, but always carry enough to allow foliage to dry before night.

In using liquid manure do not apply when the soil is very dry. If applied after a moderate watering there is less danger of over feeding, which should be discontinued entirely after the flowers show color. In concluding these rather lengthy remarks on watering I will say when you do water be sure that it is enough to wet the soil clear through to the boards of the bench or bottom of the pot as the case may be. When you have acquired the science of watering and practice it carefully, wisely and faithfully you will have gained about 17 points out of 20 towards being a good gardener.

August the 10th is as early as it is generally advisable to take the buds of

the earliest varieties and those will be "crowns." In taking or selecting buds the side growths must be taken out as soon as large enough to rub off with the thumb and the plants kept quiet until the buds are well formed. The crown being an unnatural bud requires considerable care to insure its producing a perfect bloom. Terminal buds are the safest and in most varieties produce the best flowers, while crowns are earliest and should be used for that purpose if properly understood.

All flowers should be cut and placed in water at least 18 hours before being put on the counter or shipped to the retailer. Varieties that easily drop their petals, as some of the most beautiful do, and yet desirable, should be in water 36 hours. This will harden the flowers and hold the petals. If the flowers are to be shipped it is time well spent to pack with the greatest care so they arrive at their destination as perfect as when they were cut.

I know of no better way to tie or support the stems of chrysanthemums than by running wire across the bench near every row and a corresponding wire above the plants keep the upper wire well up. From the wire on the bench to the one above run a string for every plant. The cheapest string you can buy is good enough. This is easily disposed of when the crop is cut. You may throw away the bottom wire but the upper one is not likely to be in your way and will do duty for several years. Anyone adopting this plan will never again resort to stakes of any kind, unless it be for late struck batches on side benches.

Chrysanthemums can be planted much closer than they often are, but that will depend on how many flowers you intend to grow to each plant, and that again is controlled by what your trade demands. Three at the most is all you should expect from any plant, and I believe it most satisfactory all 'round to grow but one stem and one flower on any plant, and then plant thickly. The rows 8 inches apart and the plants 6 inches will do for all the moderate-sized flowers; for very large specimen flowers, 10x8 would be better.

Pot Chrysanthemums.

For several years the demand for these has not been at all satisfactory. I believe there is only one way to profitably grow a moderate-sized, healthy pot plant, that will keep its foliage and really be respectable in November. Choose healthy, young plants, that have been propagated in April. If they have been stopped once and are in 3-inch pots, so much the better. By the middle of June you will have some vacant benches to spare by bedding plants which are gone, or you may throw away a bench of carnations. Five or six inches of soil on the bench will do, and even if it has grown carnations the previous winter, is good enough, with the addition of bone flour and a little rotted manure. Plant 15 to 18 inches apart. They will make a fine growth during summer and should have all their growths stopped at least twice before lifting. You have them under perfect control by this method, and can keep them watered and syringed, as well as keeping the aphis subdued. The first of September, neither three days before nor after, is the time to lift them, which should be done with a digging fork, and by getting the fork down flat on bottom of bench you need not lose a fiber. These plants grow a great deal after lifting, so don't crowd them into too small a pot. We find a 6, 7 and 8-inch suits the different varieties. A few days of shading and a frequent syringing and they will have taken hold of the new soil, when you must give them a light, airy house. These plants on an average have 12 to 20 buds, each bud disbudded to one flower. Most of them can be tied by one stake in the center and thread or raffia leading to each branch; larger plants, such as Lincoln always makes, will require several stakes; but let them be always small and inconspicuous. Only a few varieties are adapted to this purpose. The short jointed, dwarf varieties are the ones, and of all varieties that I have tried, Ivory and Lincoln are the ideals. Maud Dean is pretty fair, and so is Bonnaffon.

W. S.

CHRYSANTHEMUM NOTES.

Early Varieties.

Cuttings should now be rooted of all the early kinds, because if they are rooted in good season it helps on their natural tendency to come in earlier. Of course a grower always grows such kinds as best suit his market, and to the retail florist a few good early flowers are very useful. Personally we don't care to have many of the earlier kinds, though sometimes they sell better than the mid-season varieties, for at that time the usual glut has forced prices down to bedrock.

Quite a list of early kinds can now be had to select from. Lady Fitzwygram, Mme. Bergmann, Glory of the Pacific, Merry Monarch, Yellow Monarch, Marion Henderson, J. E. Lager, and so on. We are content to wait for Mrs. Robinson in the whites. It generally is in good shape for cutting by October 15, and when it does come all other whites fall far behind. Glory of the Pacific is a very good pink. It is vigorous, has a good stem and excellent foliage. Henry Hurrell is a comparatively new early yellow variety of promise, and will be grown quite extensively this year. Among other good points it is an excellent keeper. J. E. Lager is also good in the yellows. The two namesakes of Lager and Hurrell make as good a team as the originals, who, I suppose, since they went into the orchid business would refuse to acknowledge the poor but honest "mum."

New Varieties.

Plants of some of the new kinds are to hand, some good, others spindly and weak enough to cause one to ask with suffering Cuba: "How long will these things be?" Still novelties we must have, or get left in the march of progress, and I suppose with some of these we are liable to get left anyway, so what's the use of grieving. I have read that a man puts the stamp of his own individuality on the plants he grows, and if this be so there must be some consumptive looking, spindle-shanked "mum" growers around somewhere. When plants are received the best thing to do with them is to take off the tops for cuttings as soon as practicable, and send the old plants "where the woodbine twineth." By so doing you remove the possibility of introducing any disease to your own plants, a remote possibility, perhaps, but it is best to make sure, and the cutting, if you root it yourself, will ninety-nine times out of a hundred do better with your system than the old plant would have done.

Cleanliness is a very important thing to keep in mind around a cutting bench. Every morning the bed should be carefully looked over and any dead or decaying foliage should be at once removed. This may not look very important, but if it be neglected with some varieties, like Golden Wedding, that are prone to disease, first thing you know it spreads through the whole batch and for all the good they will do you, they may as well be cleared out right away.

C. TOTTY.

WINTER IN MEXICO.

I send herewith a snap shot of a winter scene down in the city of Guadalajara, Mexico, which will show something of the way the park superintendent does his work there.

The railroad journey from here at the frontier down the line of the Mexican Central to Irapuato is devoid of any special interest to the traveler, unless it be the miles upon miles of mountains with their untold wealth of gold and silver, the great plains covered with long horned cattle and the quaint Mexican towns perched along the mountain sides and in valleys, the white "adobe" (big sun-dried bricks) houses glistening in the bright sunlight most beautifully. Mexico is known as the land of the sun; but the trouble is that the sun is so decidedly too much of a good thing taken with the plateau elevation of from 4,000 to 8 000 feet, that it knocks the florist's dreams into a cocked hat.

Irapuato is what is known as the "strawberry station," from the fact that one can have there strawberries practically every day in the year. Right here let me say that the Mexican strawberry is the nearest to an everbearing plant that I have ever seen. I have been over the line several times

Winter in Mexico.

at different seasons of the year and have never yet failed to have some strawberries for breakfast. Some of the horticultural writers in the States, however, are inclined to ridicule the idea of an everbearing strawberry plant. But they will see stranger things than this in Mexico.

Leaving Irapuato it does not take very long to get into the midst of the orange and banana groves that line the way to Guadalajara. I do not attempt to name the trees shown in the photo, although everybody will readily recognize the banana, which is the ordinary banana of commerce. The tall tree near the banana is a beautiful tree and looked decidedly graceful when swayed by the wind. The little umbrella shaped tree seemed like a kind of gnarled mountain oak in form, although its odd appearance made it all the more a curiosity to me. The three youthful representatives of Mexico did not seem to care whether school kept or not; and by the way they were dressed it will be readily seen that "the night fireman" is there an unnecessary article, as well as the day fireman for that matter. However, this is just as well, because a bouquet which would cost in the states from $1 to $2 American money would cost in Mexico 37½ cents Mexican money, or about 18 cents of our money.

Talk about camellias! Just go to Mexico City if you want to see them in all their glory. The florists get a decent price for them also. The 8,000 feet above the sea level seems to be just the ideal place for the camellia, and they are to the Mexican young maiden what long stemmed Beauties are to the young girl of the states; but I believe the young man of the States gets off easier financially, because in Mexico in addition to the opera, birthday, etc., there is the patron saint's birthday for whom she may be named which must be remembered, as well as the many, many feast days in the course of the year.

El Paso, Tex., March 10, 1898.

ROSE LEAVES TURNING YELLOW.

Can you explain the cause of the enclosed rose leaves turning yellow and dropping from the plant? The leaves dropped from plants of K. A. Victoria that were in good growth and bearing well. Have had the same trouble with Perle and Bridesmaid, but not nearly so much with the latter as the former. Is it due to too much water, not enough, or is it simply a case of old leaves near the bottom dropping off from age? M. B.

The rose leaves have been examined, but in themselves they give no clue to the precise nature of the trouble. If they were growing upon the lower portion of the plant they may have become yellow with age, having served their day. Should these leaves have occupied a higher position and been of recent growth they would indicate that the plant is suffering from one or more of many things. There might be an insufficient root action due to the rose root gall. This is easily determined by removing the plant from the soil and noting the presence or absence of minute galls that when in considerable numbers will cause the whole plant to take on a yellow, sickly color. It is possible that the roots are not sufficiently active and not infested with galls, as is true of all plants. It is not to be presumed that there is lack of food and that the discoloration is due to partial starvation. A similar state of things could be brought about by overwatering or by having the soil too dry. It is possible that the leaves have been scalded or injured by the sun or too hot a temperature in the house. It is not probable that the injury is due to any poisonous fungiation.

One would need to know more of the antecedents in the case before suggesting any remedial measures.

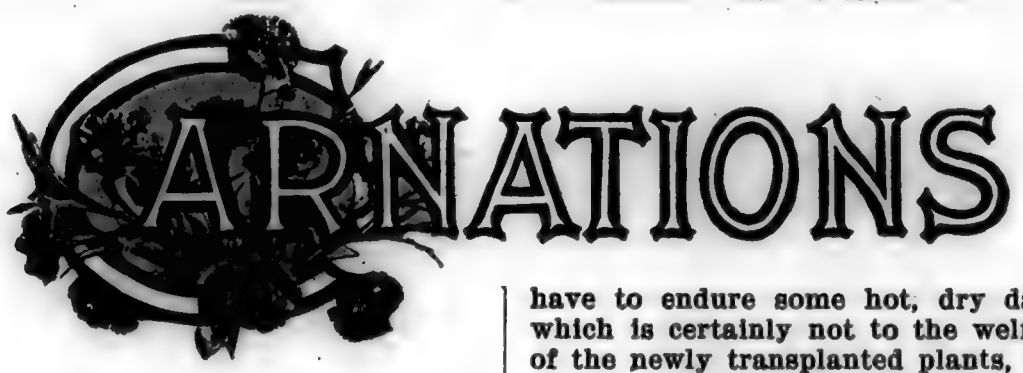
BYRON D. HALSTED.

RECIPROCITY IN PLANTS.

There are two systems in every well established plant, namely, that of the roots and that of the leaves. The chief function of the former is to absorb the liquid of the soil, the soil water, and that of the leaves to condense the liquids absorbed by the roots and make them over, under the influence of the sun, into the substances that may be used thereafter for the growth of the plant.

It goes without lengthy explanation that there must be a direct relationship between the amount of root surface and that of the leaves, the one for taking up water, the other for exhaling it. Should there be any reason for an increased loss of water at the leaves due to a dry atmosphere and a hot sun, it is easy to see that there would be greater demands made upon the roots. If these demands are not honored it only remains for the leaf surface to be diminished or the evaporation be checked in some other way. A smaller exposed surface in the foliage is brought about by a folding of the leaves or leaflets or a coiling or rolling as in long narrow blades like those of grasses. A substantial check upon the escape of water is brought about by the closing of the millions of stomates or breathing pores found in the skin of the leaves. As the water in the leaves diminishes below a certain amount the leaves are wilted, and these "mouths," before wide open, become closed. This, with the increased root action, enables the plant to get through the hot day, and as soon as the night comes the roots are able to fill up the leaves again, and by morning all are plump and ready for work.

But it is with a newly set plant that we are most interested when vegetable reciprocity is considered. We sometimes forget how delicate is the relation established between the roots and the soil, and when a plant is transplanted the roots may be broken and thousands of the fine root hairs destroyed. The whole absorbing apparatus in short has been upset, and only time under the most favorable circumstances can bring order out of chaos that has resulted from the transfer. New root hairs need to be made in order that the required intimate relation may be restored between



roots and soil in the new situation. This needs to be done at the expense of food already in the plant, and before the soil water can be absorbed and sent up to the drooping foliage.

During this period the leaves are of very little use to the plant and often a positive damage, because the exposed surface is too large and the whole plant may dry out so much as to be beyond recovering when the roots have made their active union with the soil. The foliage therefore of a plant to be transplanted, as a rule, should be reduced, provided the surrounding conditions are not under control, for it is possible to reduce the loss of water from the leaves in small potted plants by having them in a cool, moist place where they will not dry out. But with out-of-door plants this is not usually possible and then the leafage needs to be reduced. In short, if one system is suffering, the other needs to suffer with it, and if the roots have been pruned the branches bearing leaves need to be pruned to establish the proper relations between the two.

In this connection it should be borne in mind that frequent watering of the soil of a newly set plant may be injurious. It does not need floods of water so much as time to make new roots and root hairs under the most favorable conditions, which are not in a water soaked soil.

BYRON D. HALSTED.

Rutgers College, April 2, 1898.

EARLY AND LATE PLANTING OUT.

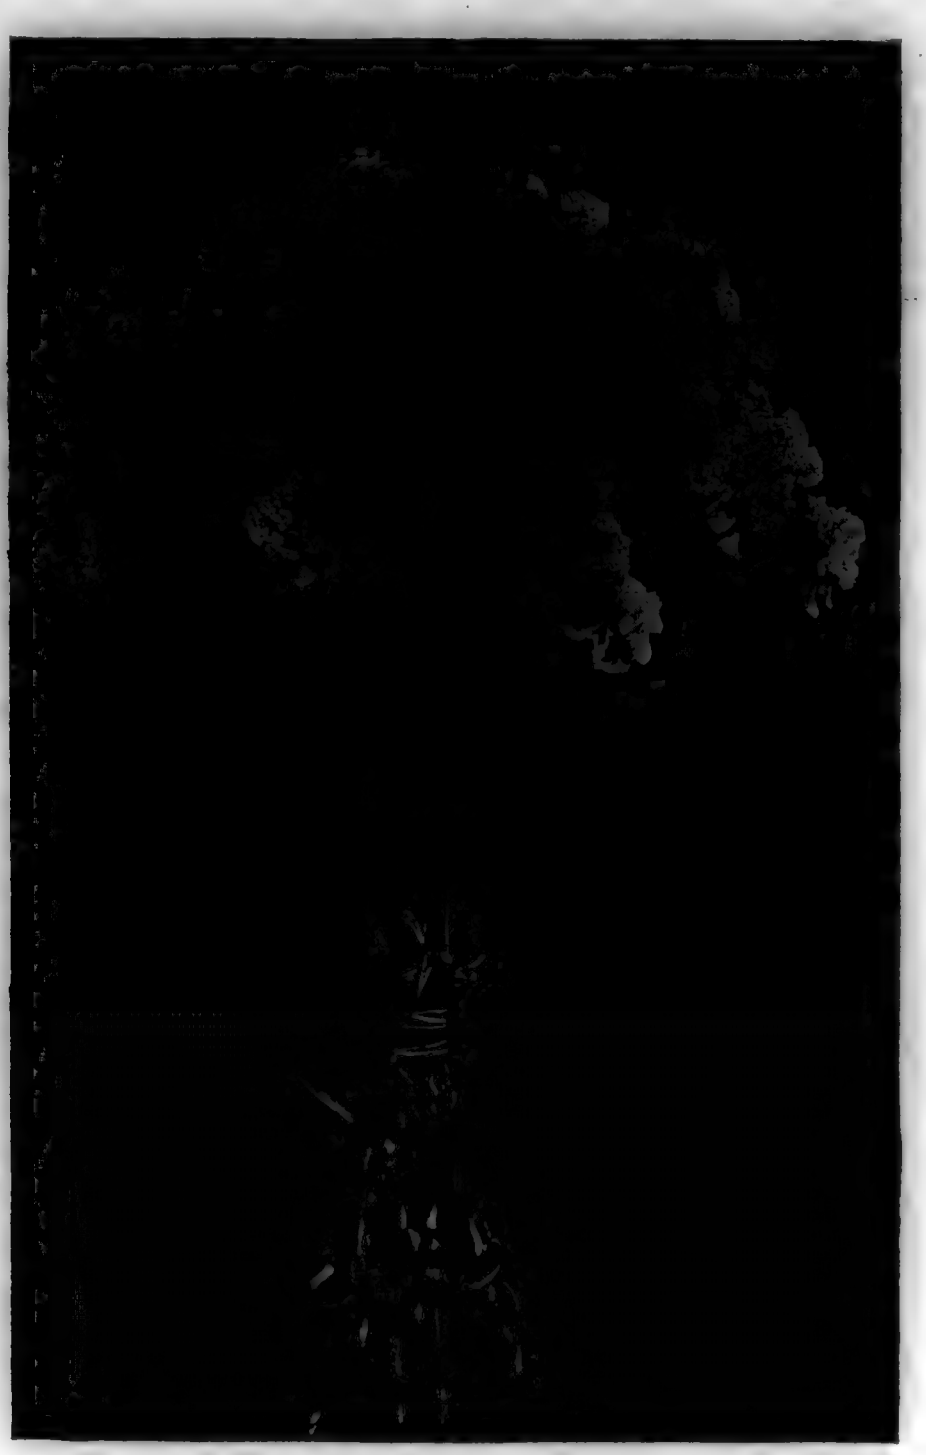
The time for propagating soon ends. It becomes rather a difficult task to root cuttings successfully in a higher temperature, as we have to expect now, and in fact have already experienced. Two or three days of dry, warm weather, which will make it impossible to control the temperature in the house, will give them a setback that will very much lengthen the usual time to root, and diminish the percentage of the crop of well rooted cuttings. This will not very materially change the quality of them, as they come from the sand, but the advantage of an early planting for a successful summer growth cannot be overestimated, and these delayed cuttings can certainly not be equal to the earlier propagated ones, now growing on in flats or pots, or planted out on shallow benches, ready for an early transfer to the field. Of course much depends on circumstances, an early or late spring, moist or dry weather. In my experience I have had as good success with these late propagated plants as with the early ones, but these are exceptions.

In an early planting we are often confronted with many aggravating circumstances injurious to the freshly transplanted plants that often vary with each season. Our planting time, as a rule, is the month of May, but it is preferable if we can accomplish it earlier; if we can get them out in April so much the better. But even in May we may still encounter severe frosts, and as early as in April we may have to endure some hot, dry days, which is certainly not to the welfare of the newly transplanted plants, and results often in serious consequences. So in an early planting-out, all depends on the condition the young plants are in; if they were kept in a well ventilated, sunny house and in rather a low temperature, just warm enough to keep them in a growing condition, they will be well hardened and neither a late frost nor early warm, dry days will affect them very seriously. This is the advantage of early propagated plants and well kept, hardened plants, thus being in time to take advantage of chances as they may present themselves.

But there often occur circumstances that deprive us of this advantage; we have to do with later propagated plants; our stock is not large enough to furnish us the desired quantity of suitable cuttings at one time; we have to depend on a later growth. Delay may occur from a hundred and one different sources, and we may be compelled to use plants of a late propagation. To alleviate conditions of this kind the best way is to treat such plants the same as you necessarily treat your early plants. Pot them up in 2-inch pots and transplant from these pots. This may seem a delay and additional work, but this work is well repaid in their advanced growth, in their more fitting condition for the transfer. Use a light, rich soil that contains well decomposed, ready food, and keep them in the pots, if only for 12 or 14 days. This will enable them to take up some nourishment and cause the roots to start and fill the little pot. You have them under your control, can shelter them from inclement weather which they would have to endure unprotected. To say the least, to transplant from the sand to the open field is a very hazardous undertaking.

I very much prefer to transplant from pots; the little balls are a network of roots and remain intact, the transfer being hardly noticed by the young plants, if care has been taken not to grow them too soft. If the roots appear matted they should be loosened and partly torn away, but without breaking the ball. All the stock intended for our own use is potted up as it comes from the sand, and if of early propagation, shifted into larger pots if necessary. It often occurs with us that in many varieties, when orders have to be filled and stock runs short, that our lot is the last batch of cuttings, and to my experience with careful treatment I have found no other detriment than a later blooming in the fall. When these little plants have no chance to make much growth in the spring, they have to make it up in the fall, and hence the delay in maturity and freedom in blooming; they will most always establish themselves to endure the summer heat if treated properly.

With this I would not like to be understood as encouraging late planting, for it will never prove so profitable as an early planting, but as I have said before, circumstances may compel one to do it. Anybody can grow plants and flowers if conditions are at all times as they should be, and it is just as important to know what to do under adverse circumstances, for this makes the skillful grower.



The assertion that late propagating and planting out will help to degenerate the stock, I do not believe, and it should not be confounded with the results of early and late planting, as far as profit is concerned. Early plants have the advantage of a spring growth, mature earlier in the fall, are of larger size when housed, and are consequently earlier in blooming, while late plants have to make their principal growth in the fall, come later into bloom, and consequently cannot bring so many blooms through the season and are therefore less profitable. Now according to my experience there is one other important point: The late plants furnish me the best and healthiest cuttings at the right time.

FRED DORNER.

AMERICAN CARNATION SOCIETY.

Efforts are being made to increase the amount of subscriptions to the permanent fund, the interest of which is to be used to pay the running expenses of the Society. About $400 was subscribed at the Chicago meeting in sums of $25 each. Secretary Herr invites others interested to add their names to the list of subscribers.

The committee appointed to investigate the legislation on plants, etc.,

A Bunch of Genesee Carnations.

pending in Congress, urges every member to send a letter to his Congressman asking that a section be included as follows: "That the provisions of this act shall not apply to florists' greenhouse trees, shrubs, plants, bulbs, etc., commonly known as florists' stock," and stating in the letter: "I desire the addition of this section on account of the very perishable nature of florists' stock, which would not allow of its being held in transit or opened for inspection, and on account of its entire freedom from San Jose scale."

Such action need not be confined to members of the society, and every member of the trade would find it to his interest to do all in his power to avoid the application of the proposed legislation to greenhouse plants, as it would otherwise cause the trade much useless annoyance and expense as well as occasional loss through damage by delay.

CARNATION GENESEE.

We present herewith an engraving from a photograph of a bunch of flowers of the new white carnation Genesee. By many good growers this variety is considered a coming white of the most profitable type, the plants producing with remarkable freedom and regularity. It was originated by Messrs. Harmon & Burr, Darien, N. Y., and is being introduced by Mr. D. B. Long, Buffalo, N. Y.

BOTANY—IT'S AID IN GARDENING.

[Read by Mr. Jas. J. Scott, at the meeting of the New York Gardeners' Society, March 12, 1898.]

There are many sciences which merge themselves into gardening, namely, chemistry, biology, etc., but botany is horticulture's allied science, and there is scarcely a phase in the gardener's work in which it does not assist him. Scientists have for convenience divided the science into many divisions, such as morphology, anatomy, histology, etc., but it will be sufficient for our present purpose to treat (and that only in a very general way) the matter under two heads, viz.: structural and physiological.

In taking up the study of a given subject, one naturally, first of all, acquaints himself or herself with the external form and appearance of the subject in hand, and before we can fully acquaint ourselves with the different forms and parts, we find arrayed against us a host of big names that at once dampen our ardor, but if we set about and learn first how to spell these names, then trace their etymology, the barrier soon vanishes, and the actual working of the thing becomes interesting. This is how it is in botany. It is necessary to know the forms and parts; the rest is easy.

The gardener who has no knowledge of the external structure of leaves, stems, roots and branches, who does not know the names that botanists have for convenience applied to the different forms, who cannot distinguish botanically between a "thorn and a spine," or between a reniform and a hastate leaf, or between the many forms of leaves, fronds, bracts, etc., must find it a laborious work to hunt up any variety of plant in such a work as Nicholson's Dictionary, or any botanical manual, not to speak of the ordinary nurseryman's catalogue. Even though it were for no other purpose than to be able to trace plants in any such work as these, the knowledge is of vast importance, and he who once acquires the knowledge will never regret it.

Physiology.

Let us now look at the inner working of the plants, and the phenomenon attendant upon life.

The economy of nature is so complete that its very completeness adds to our negligence and lack of appreciation.

We have the vegetable kingdom on the one hand, acting as passive storers. On the other, the animal kingdom fulfilling the role of active spenders. The vegetable kingdom is changing the kinetic energy of sunlight, atmosphere and mineral matter into potential energy. The animal kingdom is again changing this potential energy, this storehouse of materials, into kinetic energy, and thus the course goes on. Animals are fast changing the oxygen of the atmosphere into gas, vegetables are using it in building up new tissue and liberating to us the oxygen. Plants and animals are both alive, both alike, but not equal. The senses of animals are centralized, plants are not. Plants and animals have however one synonymous quality—namely, their untiring effort to produce progeny after their own kind.

In the vegetable kingdom the processes of reproduction and growth very much resemble a see-saw. We

often observe, especially among fruit trees, that we have one year fruit, the next year growth, when we have fruit we have no growth, when we have growth we have no fruit; growth resuscitates life, fruiting spends it.

Science teaches us that in both the animal and vegetable worlds, reproduction requires of its host the highest elements they contain, using up their most costly products—phosphates, nitrates and albuminoids. Here nature teaches us a lesson which we very seldom heed, we hear it often said: "Last year was the apple year, this year it would be unreasonable to look for any." We heed the saying—rather than nature. Others again believe that an over crop of fruit is sure to kill any tree, so after the fruit is set and partly developed, they forthwith commence to thin it out. "A half loaf is better than no bread." But if trees are expected to live and flourish every year, if we expect to gather quality of fruit, nature says, "Thin out the flowers," by doing so we save a large amount of energy, and we also give to the flowers that are left, a much better chance to develop and fertilize. In cut flowers such as chrysanthemums, carnations, roses, etc., we fully realize the value of this, we assist nature, but we seem to forget the teachings of nature altogether in fruit trees.

Another instance in this line is the securing of the hay crop. Just before the hay is cut we often see on bright days, clouds of pollen flying in all directions. I sometimes wonder if it could be possible to form an estimate of how much is annually wasted in this way. The soil has yielded its best elements, the hay has lost its finest flavor, and the roots are debilitated in consequence.

Roots.

We might next consider briefly one or two things connected with roots. Roots of course have several functions such as fixing, absorbing and storing. They absorb all the food the plants require for building up new tissue—with the exception of gas. All the food is absorbed in liquid form, and is accomplished by the young growing roots or root fibrils. The roots in their disposition are very unlike stem and branches; while the branches are symmetrical the roots are asymmetrical, they are to be found in the largest number wherever the greatest influence is. In this they have a sense of discrimination; they twist themselves round any piece of charcoal, or bone, or other attractive substances. They are attracted by their influence, and of course the lesson would be to have the soils and manures well mixed, that the roots may be as symmetrical as possible, occupying to the full, the soil in which they ramble. Besides the presence of certain mineral constituents in the soil, there are other conditions required for the healthy growth of roots, the principal condition being free access of oxygen. Not only is oxygen required for the decay of the different organic substances in the soil and preparing them for absorption with the water, but all healthy roots require it to sustain the old and develop new cells. The soil should always be in a condition to admit air freely, not only from the top, but pots should always have air space below. In the cultivation of fruit trees and vegetables this is also useful, and the knowledge has been instrumental in doing away with the old fashioned obnoxious system of planting roots deep in the soil. I can remember some of our old gardeners planting trees 1½ feet deep. This knowledge has led men to be more rational, and 6 inches is usually the depth we find trees planted now. The old men were frightened for their trees being blown over, while we assist them with a stake. This surface rooting is much more observable in some trees than in others.

In the vegetable garden we do not cultivate continually to keep down plants that are not wanted, but rather that the surface may be kept open for the access of oxygen. This cultivation also serves another purpose. In dry weather we often find a hard crust on the surface of the ground. This is caused by the deposition of saltpetre and other salts. In dry weather evaporation is excessive, the moisture in the ground gets worked up, and sinks lower and lower till it reaches the permanent water level. Capillary tubes are formed and the water from the permanent water level is brought up with the salts in solution, the water is evaporated, and the salts are left, thus forming the crust. By hoeing (or cultivating) this crust is broken up, the capillary tubes are cut and the much needed moisture is left in the soil to nourish the roots.

These are well known principles yet I served under a gardener who held a good position, and he would not allow us to hoe amongst the vegetables in dry weather, for fear we would loosen the ground too much and let in the drought.

Leaves.

One could say a great deal about the form, structure and function of the leaf—but time will not permit. Leaves are literally the lungs of plants. They must have a supply of sunlight and they must be green; this green substance (chlorophyll) is formed only in the presence of light (an exception being in fern where a certain degree of heat is sufficient) and gas is only liberated under its influence. The gas of the atmosphere enters the leaf by means of small opening stomata, it is there decomposed, its oxygen is restored to the atmosphere, while the carbon is chemically united with the water and other mineral substances (from the roots) to build up new and organic compounds.

Plants also carry on a process of respiration, this goes on continually, irrespective of the presence or absence of light, but during the day-time the feeding by the decomposition of gas and assimilation is so greatly in excess of the respiratory act, that it completely overshadows it; during the night no assimilation is taking place, so the taking in of oxygen and giving off of carbon is more easily perceived.

It is owing to this process of respiration that the atmosphere of our greenhouses is always so heavy and dense in the mornings, and it is because of this that medical men tell us never to have many plants in our bedrooms.

Botanists do not readily go in for freaks in nature and they tell us that a leaf is not a leaf at all unless it be a green one; economically this is true, for it is only the green part of the leaf that is of any use to the plant; this is why cuttings of variegated plants are difficult to root, and why variegated plants are generally delicate.

Classification.

We might now consider very briefly classification. The system of classification as devised by Jussieu is everywhere recognized at the present day; unlike Linnaeus he takes into consideration the whole organization of the plant with its properties and habits. The principal thing needed in classification is a thorough knowledge of structure and an acquaintance with the general outlines of the different orders. A gardener with a thorough knowledge of classification is seldom at a loss to find out the name of a species or variety, provided he has good works for reference.

Besides the advantages which classification gives in finding the names of species and varieties, it also helps us largely in cultivation. Take for example the relationship of any of our orders, say the ericacae. Not only is there a similarity in external appearance but with very little exception the habits of life are the same. They all find themselves more or less at home in a soil mostly composed of peat or leaf mould and while they detest a sour soil, yet they love to be kept damper at the roots than the general run of plants; their roots being hard and fine, they naturally require this. They also have a characteristic aversion to lime. I served at one time under a famed heath and azalea grower and he would use nothing but rain water in watering his plants (the locality was one in which lime abounded); some were apt to call him eccentric, but his results proved that there was method in his eccentricities.

On the other hand if we take the order leguminosae, we find them quite the opposite, they more or less abound where lime is to be found. The Irish shamrock being an example of this—the country is rich in limestone.

The solanums again are more or less fond of carbonaceous matter. Cruciferae use up lots of potash and so on.

Free Cuba in Flowers.

Gentlemen I have already taken up much of your time, probably to little account, as I have already said, the subject cannot be given justice in such a paper as this. I have told you nothing new, perhaps have not even put it in a new light, but I trust enough has been said to warm some hearts to this delightful, profitable and healthy study, and perhaps to give renewed impulse to those who may have already given the matter consideration.

FREE CUBA IN FLOWERS.

The accompanying engraving is from a photograph of a display rcently made in the window of Mr. J. M. Gasser, the florist, Cleveland, O. It attracted crowds of admirers and excited much favorable comment. The local Cubans marched up in a body and voted it the finest display they had ever seen.

At the left appears the portrait of General Maceo in a frame of green galax leaves, with crossed sabres at top and crossed scabbards at bottom, with two large American flags as a background. At the right is a plaque, 26x30 inches, of green galax leaves bearing the Cuban flag. The star, three white stripes and flagstaff are of white carnations, the field for the star is made of red carnations, and the two blue stripes are of blue Dutch hyacinths. The plaque rests on a stack of guns with sword bayonets, the style used by many of the insurgents. The vases in the center contain Pingree carnations and Bridesmaid roses. The frame and back of the window had a covering of gray moss.

The arrangement was conceived and executed by Mr. O. A. C. Oehmler, formerly of Pittsburg and now with Mr. Gasser.

NEW YORK.

On Change.

The early part of last week was uninteresting from any point, except to the Greeks, who take immediate advantage of a glut of stuff and low prices. The latter part of the week, however, the market improved somewhat, though prices remained about the same.

The glut of Beauties is still on, the highest price for the most select long-stemmed flowers being 25 cents each, while some have been sold as low as $15 per 100.

A noticeable shortening in the supply of good carnations on Saturday sent the price up to $3 per 100 for select Scotts, the best all 'round seller in the market, while fancy varieties stiffened to $4.

Ordinary varieties of roses, like Brides, Maids, Testouts, sold from $1 to $6 per 100. A great many Jacks are coming in, which displace the Meteor at this season of the year, and realize from $4 to $8, according to stock.

Cattleyas are getting to be scarce as the proverbial hen's teeth, and most any price can be asked, though 50 cents is about the limit for fine flowers. A few Cypripedium Lawrencianum and miscellaneous orchids are to be seen, but not enough to quote prices.

Violets continue plentiful and the cold snap still here will help them considerably for Easter. Bulb stuff is still suffering, the price for lilies being a shade better, however. Adiantum is here in force, with smilax getting scarcer and more valuable daily.

For average prices, see New York market report.

Easter Forecast.

If the florists can induce the President to hold his war message over till after Easter, business will very likely exceed expectations; as it is, one might as well guess about the millennium.

Beauties will be here in unprecedented quantities, and there will be no scarcity of any rose stock, from present indications. Carnations are the only thing likely to be at all scarce, with violets and bulb stock in plenty. The quantity of lilies will depend largely on the weather and price on the demand.

As I mentioned before, business is entirely problematical, and there are no indications to work on at present. There have been no orders placed so far; the usual inquiries are prevalent, and a few outside buyers are here in person.

Various Items.

The regular monthly meeting of the New York Florists' Club will be held next Monday, April 11, and Mr. G. W. Watson, of Philadelphia, is slated to give an interesting talk on "The Florist Versus the Flower Show." The competition for the club's medals and certificates will also be held, and some interesting exhibits are already entered.

Mr. J. W. Scallen opened his new store last Saturday, though the formal opening will not occur till Wednesday, in time for the Easter trade, which promises to be fully up to previous years. He will also retain his old store till May 1. I noted in his store some of the old favorite rose, La France, large flowers and excellent color.

Among the Retailers.

I noted some very pretty Wisteria sinensis in one window, decked with narrow lavender ribbon to match; also some handsome growing hybrid roses. Mrs. John Laing and others, in boxes garnished with crepe paper and ribbons, which looked very rich. Pots of growing violets sell exceedingly well, and a few Crimson Ramblers in pots are to be seen. This rose is grown very largely now for Easter and is becoming very popular. Heaths and azaleas in variety are to be seen everywhere and make the stores very bright and attractive.

I dropped into the Bridgeman Co.'s store the other evening, and Mr. Bridgeman, who is a past master in the art of floral decorative art, showed me some examples of his handicraft. It was a souvenir night of the play, "Monte Carlo," and the stars were to be presented with appropriate gifts. One was a Dolly Varden hat, trimmed with sweet peas, swainsona (white) Bridesmaid roses and pink ribbon, on which were worked gilt letters. This is done by writing the motto in plaster of paris and gilding same. The other was an immense horseshoe, composed of leucothoe sprays for a background and lilies, Meteor roses, Maids, narcissus and maidenhair fern, and across the face was a broad ribbon upon which were five playing cards, "three

aces and two kings," representing a full house. Next!

In the window, which is always tastefully decorated, was a stunted and dwarf cherry in full bloom, quite unique.

Auctions.

The auctioneers' innings have come again, and quantities of imported nursery stock and miscellaneous home grown nursery and florists' stock are falling under the hammer and good prices are realized.

Mr. W. J. Elliott, who wields the gavel for William Elliott & Son, is a "chip of the old block," and eloquently sustains the reputation of this house.

Mr. John P. Cleary, of Cleary & Co., who wears a straw hat and has a "blanket" catalogue of large proportion, prefers knocking down lots to Spaniards and denies the rumor that he will shoulder an improvised hammer and start for the front.

PHILADELPHIA.

Business Brisk.

Business has been very brisk the past week. Easter plant sales are ahead of last year, and if the weather this week is reasonably clear—not seasonably, for it is April—there is every indication that this will be a great Easter. Enormous quantities of flowering plants have been sold at good prices. Despite war rumors there is a general feeling of confidence among the retailers.

Plant Novelties.

The best novelty offered is Crimson Rambler rose, Robert Craig being the leading grower. So confident was Mr. Craig of this rose's future as an Easter plant that he filled two houses with it, and the result has fully justified his faith. The plants, many of them enormous specimens, covered with bloom, have all sold at most encouraging prices, many of them going to other cities. Hydrangea monstrosa is also attracting attention, the plants being dwarfer than Otaksa and seemingly freer bloomers. Both genistas and deutzias are more than usually good this season, W. K. Harris having both in fine shape. Spiraea is hardly so fine, as a rule. It is thought that it has been grown on poor soil abroad. Azaleas are very fine, especially the plants carried over summer here. Many of the azaleas are greatly improved in appearance by having the lower shoots tied down. Lilies are not especially good, except the Japan grown, which have perfect foliage, though not very large blooms. The general effect is however pleasing. Some excellent rhododendrons are seen. The best daisies are the yellow of which Albert Woltemate has a superb lot. Tulips are very fine, especially the doubles. Valley is good but Von Sion is rather poor.

Cut flowers have sold pretty well and it is believed that good stock will be scarce by the end of this week.

Penn. Hort. Society.

The Spring show of the Pennsylvania Horticultural Society opened on Tuesday and lasted four days. It was an exceedingly pretty show, the only chance for the critic being Lord Byron's idea of woman—a good thing and therefore ought to be not small but large. Secretary Rust deserves great credit for the exhibition. The quality was above the usual high standard and there would undoubtedly have been more but that the florists are too busy now for shows.

The Exhibition.

Albert Woltemate arranged a beautiful group of orchids for effect. Henry A. Dreer showed some interesting novelties, W. K. Harris had some excellent genistas. Francis Canning had fine Bellis perennis, myosotis and the tallest lily I ever saw. Westcott's Nurseries made a fine decoration and so I might go on did time permit.

The cut roses and carnations were the crowning glory of the show, Messrs. Heacock, Anderson and Burton showing excellent roses—Beauties, Brunners, Maids, Carnots and Victorias. H. Weber & Son sent Mrs. Robert Garrett. Flora Hill, Victor and Empress attracted much attention, Messrs. Craig, Herr, Swayne and Graham being large exhibitors. Pennock Bros. and Jos. Kift & Son made up some beautiful designs.

John McCleary, gardener to Wm. Weightman, made a fine exhibit of vegetables grown under glass and R. Kaighn, Ellisburg, N. J., one of vegetables wintered in cellar and grown in frames. Lack of time prevents a more detailed account of the many other excellent exhibits.

The weather was rainy on the opening evening but the second day brought out a more encouraging attendance.

Florists' Gun Club.

The Florists' Gun Club team won the State championship at Reading on Wednesday, defeating three other crack teams and breaking 126 out of a possible 150 targets. The score was as follows:

Anderson	22
Burton	17
Bell	19
Cartledge	22
Hallowell	23
Park	23
	126

Mr. A. B. Cartledge also shot well in the open events winning one and tying for first honors in another.

H. Waterer has invented a clever device for drawing off water from the bottom of a large vase which should prove a decided advantage, avoiding the necessity of taking the plant out and turning the vase upside down.

J. W. Y.

BUFFALO.

Weather Conditions.

It is sad to see frost and snow just now after the beautiful and balmy March, we shall never forget, still is better to have these chilly days now than the end of the week. If it will warm up the last three days of the week we will forgive everybody. We are all confident that Easter will bring us a fine business. It certainly can't be called very bright just at present but there is generally a lull before the storm.

Easter Supply.

Church orders that were once so prized and coveted cut but a small figure now in the aggregate of our business. The demand for our flowers and plants now is on a healthy basis and likely to last. Good people believe that bright and pure and sweet flowers are the most cheerful things that can enter the home and fortunately many think that their friends have the same taste and so there is an exchange of good feeling and to this we must attribute a very large share of our patronage. "Tis twice blest, it blesseth him that gives and him that receives." The author of the quotation is dead and to mention his name will do him no good and I am not on speaking terms with any of his descendants.

There is scarcely any kind of stock that will be scarce. Roses are at their very best and he that thinks the public is going to be fleeced with exorbitant prices will get left. Violets are in fair supply and good quality, considering the past warm weather. Bulbous stock is plentiful everywhere but in the scarcity of carnations it is all likely to go. Carnations are really scarce. They are a crop that no one seems to attempt to control as there is always a good demand for them and from supply in our locality and calls from hundreds of miles away there is without doubt a serious shortage and whosoever has good ones is lucky.

Of plants there is a great abundance and we believe our city was never so well supplied. Without attempting a description of each establishment I can say that I hear of no places where the stock is far off from being on time. We have the stuff, we need the weather and we confidently expect the customers.

Visitors.

We have been among the pastures for the last two weeks and missed what few visitors there were. Mr. Vick, of Albion, N. Y., was one, and if you please who should walk up Main street

View in the Wholesale Store of W. E. Lynch, Chicago.

one fine day a short time since but Robert Craig and John Burton of national fame. We would have taken a speedy ride in had we known but did not get a chance. They looked well I understand and John was ready to shoot a match had he met a foeman worthy of his steel.

Retrospection.

I hope my friends will allow me to celebrate this day, April 4th, by a few words that is not horticulture but must be excused on the grounds that the writer never lets the day pass without a celebration of some kind and this is a very harmless way. Thirty years ago this morning we sailed out of the Thames bound for America, and we got there it is evident. We were aboard of an old ship called the Atalanta. Besides emigrants the chief cargo was railroad iron; that's a bad load to carry. It was on this ship we were first privileged to make the acquaintance of sour krout. We felt it long before we saw it. The captain was also loaded the whole journey, not with R. R. iron but some kindred hardware, so he rested most of the time and his duties were deputed to a red headed bully, the first mate. We took in our beef at Havre, also the sour krout and its consumers. After twenty-three days of rolling and pitching we landed at New York. There is something remarkable and pathetic about the career of this old tub, the Atalanta. In '67 she brought the cholera, in '68 she brought W. S. & Co., and in '69 she went to the bottom. It was time. Strange to look back at that journey and think of the awful things we were going to do with the captain and owners of the ship for the miserable accommodations and barbaric food that was served us. When a few hundred feet away from her on terra firma we looked back at her with a smile of gratitude and forgave all her sins, and soon found ourselves talking to an old friend at 67 Nassau street. W. S.

ST. LOUIS.

Easter Indications.

Every indication points to a very active Easter trade. From the present outlook stock will not be overplentiful and the commission men say that if orders keep on piling in as they have of late there certainly will be none too much. The shipping trade will probably be large as the demand from the outside was never heavier than at present.

Local trade was also quite active the latter part of last week. A number of large funerals the past week called for a large quantity of stuff, which was followed by Sunday with an unusually heavy demand for plants and cut flowers to be used for churches for Palm Sunday. The last few days the weather has been fine such as to make the plantmen say that if favorable weather conditions should continue during the critical time of the next few days the trade in plants will be larger than in previous years.

The stock in Harrisii in pots is very fine but scarce this year. Stock is moving out of the hands of the growers at a lively rate, in fact, every variety of plants in bloom seems in good demand. The wholesale men say that tomorrow (Tuesday) the regular Easter prices will take effect, the quotations of which will be as follows:

Prices.

In Roses, American Beauties cannot be quoted as the supply of this rose has been scarce since the first of the year. Brides, Bridesmaids, Jacques, Meteor and Carnots will be for firsts from $6 to $10 per hundred; La France, Woottons and Perles $4 and $6. Carnations have been in great demand for some time and the stock for Easter should be good and plenty. The price on fancy stock will be $4, others from $1.50 to $3. Daybreak, Scotts and Wocher are at their best just now. Any kind of red is selling well but fancy reds are very scarce and in great demand.

Some very good bulb stuff is seen. Tulips are fine, and some large white particularly so. The price on them varies from $3 to $5. Dutch hyacinths are in excellent shape and sell at from $3 to $5 for the best, some going just now at $2. Out door narcissus is increasing, Poeticus and single yellow are sold at 50 cents and $1.

As to cut lilies it is not likely that there will be a shortage. They are today (Monday) selling at $10 and $12.50 but most likely will go up to $15 and some dealers think they may reach $18 before the end of the week. The demand for them has been steady all of last week. Callas are selling at $10 and are plentiful at this writing. Roman hyacinths and paper whites are held at $2 and $3 for the very best and are not overplentiful. Valley is very fine and seems plentiful just now and is selling at $2 and $3.

Sweet peas are scarce and the few that come in are ordered in advance at $1.50 and $2 per hundred. Violets from the present outlook are going to be scarce and the demand for this flower is always good. Prices in advance cannot be quoted. Smilax is very plentiful and selling slowly at $10 and $12.50.

The seedsmen and nurserymen claim that business has been good with them so far this spring.

Notes.

Mr. Fuller, late of Henderson, Ky., is still in town and is talking of opening a wholesale house here since the Mound City Cut Flower Co. has retired. We have only three wholesale houses left and they can handle about all the trade for the balance of the season.

Mr. Frank Ellis, who was manager of the late Mound City Cut Flower Co., is now with the St. Louis Cut Flower Co.

Mr. John M. Hudson, who opened the first wholesale cut flower house in St. Louis but of late in the retail business, has taken a position with The Krebs Floral Co. John reports that the firm is now doing a good business.

Mr. Thomas Summerville of Bunker Hill, Ills., was a visitor last week. Mr. Summerville's visit here was to buy a large lot of violets, but as they are very scarce he left without placing an order.

Mr. Chas. Richards, who is Charlie Wors' right bower, is going to get married after Easter. I believe Effie is her front name but Charlie is very careful not to make known her other name.

The exhibition committee has fixed the dates for the next chrysanthemum show to be held at the Coliseum on Nov. 15, 16, 17, 18 and 19. The preliminary list is now in the hands of the printer and will be out by next week in time for the next meeting of the club.

On last Friday night, April 1, Mr. and Mrs. Francis Fillmore, Sr., celebrated their golden wedding at the home of their son Frank, on Nebraska avenue. A large gathering was present. Among the florists seen were Mr. and Mrs. John W. Kunz, Mr. and Mrs. Fred C. Weber, Mr. and Mrs. C. A. Kuehn, Mr. and Mrs. Carl Beyer, Mr. and Mrs. J. J. Beneke and Emil Schray.

The Bowling Club presented the aged groom with a handsome gold headed cane and the aged bride with a gold headed umbrella as a token of friendship for their son Frank. A great number of presents were displayed by their friends. The house was handsomely decorated with plants, smilax and cut flowers. All the ladies wore old gold ribbons and the gentlemen Perle roses. After an elegant supper dancing was in order and nearly all the guests stayed until the small hours in the morning. Mr. Fillmore is at present employed in Tower Grove Park with Prof. Gurney.

The bad weather on Monday night kept most of the bowlers at home, and only four out of the regular ten braved the wind and rain. C. A. Kuehn made 593; Beneke, 558; Kunz, 555, and Helwig, 475. The high single score was by Beneke, 233; Kuehn, 213, and Kunz, 199. We hope for better weather for next Monday night. This being Easter Monday, we will have a few prizes for which to roll. They will be donated by the proprietor of the alleys. J. J. B.

Editor Florists' Review: At the celebration of the fiftieth anniversary of my wedding, announced in your last issue, Mr. Beneke, your St. Louis correspondent, on behalf of the Florists' Club, presented me with a beautiful cane and my wife with a handsomely finished silk umbrella. The presentation was so unexpected that I failed to find words to express the feelings of myself and wife at the time, and with your permission I will take this opportunity to express more fully to the donors the deep appreciation by Mrs. Fillmore and myself of the kind remembrance. F. FILLMORE.

BALTIMORE.

Easter Outlook.

From the present outlook good stuff at Easter will be somewhat scarce. Already there is a deficit in the supply of several popular lines of stuff; while at no time the past week has the production been above the demand. True, the dull and rainy weather is largely responsible, yet the present prospects for a change of barometer are very poor. At the Florists' Exchange, Easter orders are both numerous and heavy, but the manager sees little chance of taking care of them all in full. Violets are getting poorer every day, and there will be few on the 9th that will command a fancy price. Carnations have also received a setback, although the quality still remains quite up to the standard.

Bulbous stuff and flowering plants are exceptionally fine this season, and everyone seems quite comfortably supplied. Notwithstanding the diseased bulbs there are plenty of fine specimen plants and flowers of Harrisii to be seen. The retailers are now experiencing a slight depression of trade which is generally a good omen for a big rush Easter.

Club Notes.

At the last regular meeting of the Gardeners' Club, March 28, our newly elected president, Mr. E. A. Seidewitz, occupied the chair and announced the following members of the executive committee of the club to serve the ensuing year: Messrs. Wm. Feast, Frederick Burger, Robert Graham, N. F. Flitton and Hy Fischer.

Resolutions expressing the club's regrets at the recent death of Mr. Chas. Hamilton were adopted and ordered placed upon the minutes of the club, and a copy sent to the family of the deceased. In Mr. Hamilton the club lost a very valuable and most zealous member and one of its original founders.

Fischer & Ekas exhibited two very fine carnation seedlings. One the shade of Daybreak, striped with red, the other a rare shade of crimson. Mr. Geo. S. Kalb, Jr., of Catonsville, was elected a member. Mr. Frederick Bauer, of Govanstown, was instructed by the president to prepare a paper for next meeting, on "The Utilization of Greenhouse Space." At a later date Mr. N. F. Flitton was asked to read an essay upon a very important question, "Is There a Future for the Private Gardener?"

Various Items.

Last week Mr. M. Rice, of Philadelphia, paid us another visit. From the size of his order book trade must be particularly brisk in his line. Messrs. Ernest Ashley and Paul Berkowitz, also of Philadelphia, and Lloyd G. Blick, of Norfolk, were with us this week.

Mr. John Weidey, a well known florist, formerly of Waverly, is about to leave for the Klondike. Mr. Weidey was once an active worker in the Gardeners' Club, having several times served in an official capacity.

Mr. W. J. Halliday has recently given his store front a new coat of lavender paint. Samuel Feast & Sons' store has also received a new coat of grey and white.

Mr. Robert Paterson, of Madison street, has been confined to his home again by illness. C. F. F.

PITTSBURG.

Increase in Business.

Business for the past week has been on a steady increase, funeral work prevailing. Everybody seems to be satisfied with the amount of advance orders placed for Easter. Judging by the amount of Harrisii grown in this vicinity the prices will be about the same as last year, in spite of the large amount of diseased bulbs. A shortage in crop of carnations and roses will be noticed.

Extraordinary Funeral Work.

Some extraordinary funeral work was made up for Lieutenant Friend W. Jenkins, a citizen of Allegheny, Pa., who lost his life while serving his country on board the U. S. battleship "Maine."

The tribute of the Allegheny postoffice employees was much admired. It embodied the cap, collar and sleeve insignia of a lieutenant on a panel 7 feet high. It was crowned with a victory wreath of sweet bay leaves. A Union Jack and the Stars and Stripes were draped about it. Carnations, Beauties and Harrisii were the flowers used. Langhans & Co., Allegheny, made up this piece.

A floral model of the "Maine" was the offering from classmates of the deceased who were with him in the class of 1883 at the Western University. The base was of ivy leaves and white roses and from this rose the hull of pink carnations to the water line, above which the flowers were white, the masts, yard arms and guns of purple. On the forward port side the explosion was typified by a mass of red sprays. On the prow the national banner and the Union Jack completed the emblem. It was about four feet long. Gustav Ludwig, of the Allegheny market, was the artist.

The Pittsburg Naval Reserves presented a floral representation of a lieutenant's shoulder strap. The design was six feet high and composed of blue and yellow immortelles, lilies and Beauties. The outline was of yellow, at each end a white bar, denoting the rank of the lieutenant and in the center a fouled anchor. This was made up by Elliott & Ulam.

View in the Store of Hess & Swoboda, Omaha, Neb.

The class of 1886, of Annapolis Naval Academy, sent a large anchor of lilies, hyacinths and carnations.

The remains were laid in state in the corridors of the Allegheny Post-office. The corridors and alcoves were all banked high with palms and potted plants. Superintendent Wm. Hamilton of the Allegheny Public Parks and Conservatory had in charge the arrangements of the plants, which were tastefully arranged and lent an impressiveness that the crowd was quick to appreciate and their attention was divided between the bier and its surroundings.

Peter Brust, a gardener employed at the Allegheny Parks, died recently of pneumonia, aged 65 years. He had been employed at the park over 15 years. T. P. L.

CHICAGO.

The Market.

The supply has shortened materially and the outlook for Easter is not so rosy. All the wholesalers agree that there will be a shortage in lilies, carnations and good violets, and the majority look for a short supply in everything, including bulbous flowers, while others think there will be enough to go around except of the items first named and a few look for heavy receipts of flowers at the last moment. Any such are pretty sure to be sacrificed. Already large dealers are declining Easter orders from other than regular customers on account of the anticipated shortage. The present demand is very brisk. Easter prices promise to run some little over the quotations already issued. The weather of the last week has held some forward lilies back, but it has retarded other flowers, and some growers report their crops will be in a week to two weeks late. In some Dutch bulb stock crops have been already well gathered and even bulb stock will be none too plenty in consequence.

Messrs. J. D. Thompson and James Hartshorne are in the east in the interest of a new greenhouse plant they intend to erect at Joliet this summer for the growing of high grade carnations. Mr. James Hartshorne will be manager.

It will be "Private Gardeners' Night" at the next meeting of the Florists' Club, April 14, at Equity Hall, Masonic Temple. A very interesting program is promised.

E. H. Hunt is still confined to his house by illness.

Lloyd Vaughan will start out on the road again next Monday.

Bassett & Washburn are fortunate in having two houses of Kaiserins in full crop for Easter. But their Bridesmaids are off crop, and they will have fewer lilies than expected.

Kennicott Bros. Co. are receiving some extra fine carnations from F. Dorner & Sons Co., Lafayette, Ind. On Tuesday some White Clouds sold at $5 and $6 while Mrs. Bradt and Gold Nugget went as high as $8.

Walter Heffron, for the last two years with E. H. Hunt, has taken a position with E. C. Amling, as manager, and will make the change on or about May 1.

Mr. Geo. Souster, of Elgin, was in the city last Wednesday. Mr. Souster is recovering from a bad attack of inflammatory rheumatism, which confined him to the house for several months.

OBITUARY.

Robert B. Young.

We are sorry to announce the death of Mr. Robert B. Young, at Asbury Park, N. J., April 3, aged about 60 years.

"Bob" Young, as he was familiarly known in horticultural circles, was a brother to Mr. Isaac Young, partner in the old firm of Young & Elliott, and during the existence of that firm had charge of their auction department. When it dissolved, he started for himself on Cortlandt street, in the fall of '91, as plant auctioneer, moving thence to Greenwich street the following May. Owing to ill health, however, he retired from active busness and went south to recuperate, but rheumatism, contracted during the war, at last got in its deadly work and his demise followed.

Mr. Young was exceedingly popular with all who came in contact with him; generous to a fault, and always ready to befriend those less fortunate than himself; a kind master and good friend are only a few of his qualities. Though seen rarely in his old haunts by his friends of late years, his absence has always been noted, and many an anecdote has been told about "Bob" and his good fellowship, but alas! he will return no more, and so today there is one less of the "old school." He leaves a widow and many friends to mourn his loss.

Mr. Young was a member of the G. A. R. He will be buried in Mount Greenwood Cemetery on Wednesday, April 6.

BOSTON.

Mass. Hort. Society.

At the regular monthly meeting of the Mass. Hort. Society, a committee was appointed to consider the matter of enforcing the state laws for the protection of trees and insure care for those suffering from decay. There was a discussion on forestry in general.

At the weekly exhibition gratuities were awarded to James Comley for a fine display of Wisteria sinensis, and to H. Wild, gardener to Mrs. A. W. Blake, for display of Iberis perennis and Hydrangea Otaksa. Mrs. P. D. Richards received an award for native plants. Rea Bros. showed a plant in flower of Erigeron aurantiacum var. roseum, a pretty little herbaceous plant, a German novelty. There was also a number of fine displays of vegetables.

Club Meeting.

At the monthly meeting of the Gardeners' and Florists' Club next Tuesday, Mr. Jackson Dawson, of the Arnold Arboretum, will deliver an address on incidents of his travels in Europe last summer. It will undoubtedly be very interesting and instructive.

Among the Retailers.

Many of the retailers have taken ex-

tra stores for Easter. Norton Bros. have taken the large store at 406 Boylston street, where they have a charming display.

Jas. Delay & Sons have surpassed themselves in their Easter display. Among the plants may be noted four immense specimens of Acacia paradoxa eight to ten feet high and nearly five feet through, perfectly grown and a mass of golden flowers. Also noticeable are some fine specimens of Crimson Rambler rose, well flowered.

P. L. Carbone has a striking display, the decoration extending on the street each side of his store. It is a great attraction.

W. E. Doyle has a handsome display at each of his two stores and has already received the order for the decoration at Trinity Church, which is always elaborate.

Galvin Bros.' stores and conservatories are a blaze of color in azaleas and bulbous stuff. Araucaria excelsa tied with dark crimson and orange ribbon between the growths is a great attraction. C. H. J.

COPYRIGHT 1898.

OCEANIC, N. J.

A grand sociable was given by the Monmouth County Hort. Society on Wednesday, 23d ult. The hall was very nicely decorated and about fifty couples participated in the grand march, which was led by Mr. and Mrs. Robert Beatty.

Mr. W. Kennedy sang a song of his own composition, which was very well received. The society's paper, The Mon. Co. Busy Body, was read and contained as usual the latest news. Mr. H. Kettel and Mr. Geo. Stanton sang several songs, which were received with the usual praise.

One of the most prominent features was a cake walk. Mr. Hugh Birch and Miss Sarah Minton took the cake for the most comical, and Mr. Rich. Rogers and Mrs. Theodore Togg for the most graceful performance.

It was the most pleasant entertainment ever given by the society. Refreshments were served at intervals and at 12 o'clock all partook of an excellent supper. Everybody was home before daylight and on parting all expressed their thanks to the committee, which consisted of Messrs. John Downing, Hugh Birch and Thos. McIntosh; also to the competent floor manager, Mr. Robt. Beatty.

N. BUTTERBACH.

WASHINGTON.

Easter Outlook.

The boys are keyed up to a high pitch in anticipation of a good Easter. All have quantities of good stuff, and are getting it into the stores and market. Harrisii are, as a whole, fairly good, and the supply, I think, will about equal the demand. Usually quantities are shipped here from Philadelphia, which seems to have the effect of cutting prices. The current news is that Philadelphia has had hard luck with them this year, losing about one-half from diseased bulbs, and that the other half have been sold. This has kept the prices here steady.

The stores begin today to dress for the Easter trade, and from a few remarks I overheard down town the other evening, the displays will excel all previous attempts.

Mr. Wm. Clark has a house of President Carnot roses that is a sight to see. I mentioned some time ago that he had given the house a taste of winter, believing in that way he would bring it into flower by Easter with a fine crop, which he has succeeded in doing.

Notes.

Many think the war scare will hurt the trade this Easter, especially so if war should be declared this week, while others think it will not.

The semi-monthly meeting of the Commercial Florists' Association was postponed one week, owing to stormy weather. There is expected a lively time and a good attendance is promised. W. H. K.

GRAND RAPIDS, MICH.

Florists' Club.

The Grand Rapids Florists' Club held a meeting Tuesday afternoon at Geo. Hancock & Sons, at Grand Haven. Their house of seedling carnations was the center of attraction. There were many fine varieties, among which was a scarlet of somewhat the habit and appearance of Jubilee, but a little better color; also a white that seems above the average, and if it were not for a slight tendency to burst, might take its place in the front ranks of the whites. Firefly, their pet red, showed up well. It is a free bloomer, good flower, and save a shade of dullness in color, is a most desirable variety. Gold Coin in yellow is also good, being a color between Pingree and Gold Nugget.

This enterprising firm utilizes the space under the benches for growing pie plant.

Celery is extensively grown here, as is also tomatoes, they having a tomato canning factory adjoining the greenhouses. But what is more to the point, they handle nearly all the new carnations on the market, and the florists took advantage of this opportunity to buy what new stock they required. Gold Nugget, Evelina, White Cloud and Genesee were bought in large quantities.

A bountiful banquet was served at Geo. Hancock's, after which the meeting was held at James Hancock's, close by. N. B. Stover presided. No paper was read, on account of the absence of Wm. Cunningham; hence a free-for-all spring flower discussion ensued.

Discussion.

Bulbs as cut flowers were not considered profitable to grow by the retailer, on account of the fluctuations of demand. Again, just as soon as you are off crop, all your customers are in urgent need of bulb stock, and nothing else will suit.

All are having considerable trouble with the lily disease and ascribe it to various causes. Is there not some color to the claim of immature bulbs being the diseased ones, on account of not being allowed to properly ripen? That being the case, are we not ourselves, in a measure, responsible for this condition of affairs by being so urgent in making the bulb agent promise to get the bulbs to the buyer at such an early date that they have to be delivered before mature? It was a noticeable fact that one florist buying of one particular firm had better bulbs than those bought elsewhere. Another, buying of this same firm, found those bulbs the most diseased of any, and vice versa. Buying the bulbs seems to be a hit or miss game of chance, mostly chance.

One grower stated that while using sulphur for mildew he used an overdose and injured the plants in a portion of the house where there were a batch of lilies badly diseased, and they were uninjured by the sulphur and immediately made a fine new growth, proving to be the best lilies he has. Would not the use of sulphur prove beneficial in treating the disease?

A vote of thanks was passed Geo. Hancock & Son for their kind hospitality. The next meeting will be held at the Eagle Hotel, Tuesday evening, April 5th; subject, The Tariff on Plants and Bulbs; essayist, Geo. F. Crabb. On the way to the depot the 'bus broke a spring, presumably the added weight of the carnation stock on board was too much for the springs. We walked the rest of the way.

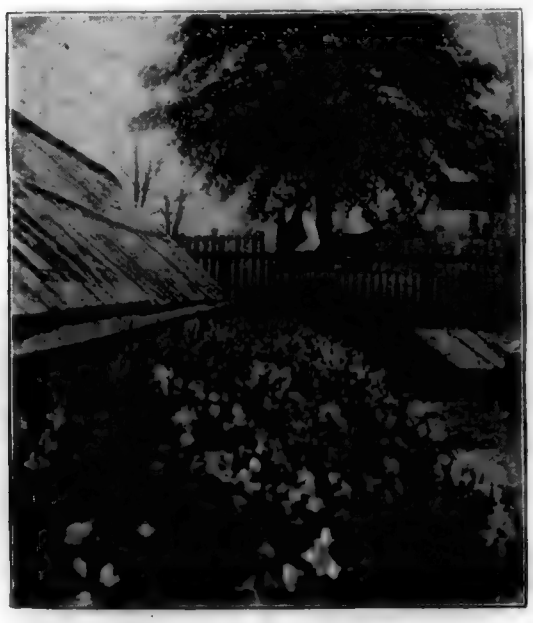
LOCKPORT, N. Y.

Thos. Mansfield has a pretty lot of Easter stock, which will be replaced with a well-grown batch of bedding plants. A big line is sold annually.

SOCIETY OF AMERICAN FLORISTS AND ORNAMENTAL HORTICULTURISTS.

OFFICERS.

Pres., Wm. F. Gude, Washington, D. C.; Vice-Pres., A. Donaghue, Omaha, Neb.; Sec. Wm. J. Stewart, 67 Bromfield St., Boston, Mass.; Treas., H. B. Beatty, Oil City, Pa.



NEXT MEETING.

The fourteenth annual convention will be held at Omaha, Neb., August 16, 17, 18 and 19, 1898.

The Trans-Mississippi and International Exposition will be held in Omaha, June to October, 1898. F. W. TAYLOR, Supt. of Horticulture.

AMERICAN GROWN ROMANS.

The accompanying engraving shows a bed of white Roman hyacinths grown by Mrs. H. Rehder, Wilmington, N. C. The bulbs are three years old and are from sets originally taken from mother bulbs. When through flowering they are lifted, cured, and again planted out the latter part of August.

These flower as freely and throw as large spikes as the best imported bulbs.

The photograph was taken January 22, up to which time no protection was needed. It will be noticed that Willie Rehder stands in the background without coat or hat, apparently meditating upon the burning question of bulb growing in the south. A cold snap on February 3 put a different complexion on things, however.

MR. ALFRED REHDER, of the staff of Moller's Deutsche Garten Zeitung, Erfurt, Germany, is about to pay a visit of six months or a year to America to further his dendrological studies. He will first spend some time with Professor Sargent, at the Arnold Arboretum, Boston, and will later visit many of the leading horticultural establishments in America.

ALBANY, N. Y.—Out on the Troy road John Dingwall shows the boys how azaleas should be done for Easter, with a big batch of bedding stock to follow.

L. Menand has a well-grown stock. His store and cemetery business is considerable.

OTTAWA, O.—J. Fred Risser, son of Henry Risser, of Lima, O., has started in the florist business here.

WANT ADVERTISEMENTS.

SITUATION WANTED—By a thoroughly practical gardener and florist to take charge of private or commercial place where wages would be commensurate with results; responsible references. Address A. M., care of Florists' Review, 56 Pierce Bldg., N. Y. City.

WANTED—A first-class grower who knows enough to run a place on business principles, to buy one-half interest and take full charge; must thoroughly understand the business. If dissatisfied with his purchase any time within one year he can have his money back. For particulars address A. H., care Florists' Review.

SITUATION WANTED—By a gardener; German, 31 years old; married; 16 years' experience in flowers, fruits, vegetables, care of pleasure grounds, hothouses, and landscape gardening; position in private park, cemetery, or gentleman's place in city or country; best of recommendations. Address A. Daum, 187 E. Chicago avenue, Chicago, Ill.

SITUATION WANTED—By a florist and gardener; single; 15 years' experience; who can grow carnations, mums, violets, roses, etc.; also vegetables under glass; best of reference. Address A. H. Clark, Lansdale, Pa.

SITUATION WANTED—Where first-class stock is grown; best of references from past and present employers; age 24. State wages, etc. W. D., care of W. W. Cole, Maple Hill Rose Farm, Kokomo, Ind.

SITUATION WANTED—As foreman or grower on commercial place, unquestionble ability in all branches. Reliable, industrious and capable of assuming entire charge. R. G., care of Florists' Review.

TO RENT—Five greenhouses, and material enough to build another; 3,600 feet of glass, well stocked, an acre or so of land, and four-room cottage. Will rent to a desirable party as low as $25 a month. A splendid opportunity. To rent on account of death of Mr. Saxon. Address Mrs. A. H. Saxon, Downer's Grove, Ill.

WANTED—Capable man to take charge of a retail florist's store in Chicago. Must thoroughly understand making up. Address D. J., care Florists' Review.

SITUATION WANTED—By practical florist with 15 years' experience in growing cut flowers. Specialist in roses. State wages paid. Address F. Campbell, 355 Ellicott Square, Buffalo, N. Y.

SITUATION WANTED—First-class cut-flower grower; 12 years' experience; single; 28 years; extra good rose grower; best of reference; wish employment at once. Address, stating wages, T. E. Gleason, 95 E. 26th St., Chicago, Ill.

FOR SALE: 1 dwelling house, 2 greenhouses, 17 x 150 newly built: well located and good home trade, on st. car line and near a city of 300,000 population. For particulars address P. O., care Florists' Review.

SITUATION WANTED—By married man, as rose grower or foreman: good grower of cut flowers and general greenhouse plants; first-class references; state wages. R. W., care of Florists' Review.

SITUATION WANTED—By a first-class all round florist; good grower of roses, carnations, violets, and mums, general stock, etc.; 16 years' experience. F. S., Florists' Review.

SITUATION WANTED—As foreman by an up to date rose and cut flower grower; good manager and hustler and can furnish best of references as to ability to fill a first-class position. Am open for an engagement at any time desired. Give full particulars when writing. Grower, care Florists' Review.

A FIRST-CLASS MAN is now open to engagement; fully competent in every respect; expert grower of both plants and cut flowers; wants an opportunity to better himself; no object to change unless there is an opportunity for him to show his abilities on a scale that will make his services worth at least $75 a month. Address S. D., care Florists' Review, Chicago.

SITUATION WANTED—By a first-class grower of roses, carnations, violets, etc.; 12 years' experience and can furnish best of references. Address Practical care Florists' Review.

SITUATION WANTED—By experienced gardener: single, 25; in private place; understands care of greenhouses, fruits, everything in general; best of references; California preferred. Address P. Hanson, box 251, Mamaroneck, N. Y.

SITUATION WANTED By practical, up to date florist and gardener; private or commercial place, eastern and western experience; first-class references from well known parties. Address A. M., care Florists Review.

Delivered Prices

Quoted on application. State size and quantity wanted. No order too small to receive careful attention, and none too large for our facilities.

LOCKLAND LUMBER CO.,
Lockland, Ohio.

SITUATION WANTED—By thoroughly practical all round gardener. Capable of taking entire charge of a gentleman's private place. Exceptional references as to character and ability. Address Gardener, care of Florists' Review, 105 Hudson Street, New York City.

SITUATION WANTED—By a competent florist and gardener, 14 years' experience in growing cut flowers, tropical plants, cyclamen, etc. Also a first class designer and decorator. Capable of taking charge of place of any extent. Age 30, single. R. S., care Florists' Review.

SITUATION WANTED—By first class rose and cut-flower grower who understands the business in all its branches and is thoroughly capable of taking full charge of large plant. Am employed at present but have good reasons for wishing to make a change. Unquestionable references. Add. 320, care Florists' Review.

SITUATION WANTED—By expert grower of plants and cut flowers. Competent in every department. Seeks a situation where he may have a chance to make his services worth more than in his present place. Can surely advance his employer's interests if given suitable opportunity. Address S. D., care Florists' Review, Chicago.

WANTED—A working foreman, must be an A 1 rose grower, American preferred, but must be able to furnish the best of references. No fakes need apply. The plant is backed by wealth, therefore, will have none but the best. A good salary will be paid to the man who can prove his ability. In writing, send copies of recommendations and address. Address L. T., The Florists' Review.

WANTED—At once, good florist for greenhouse work. $20.00 per month, with board. Advance in wages if satisfactory. Hillsdale Floral Park, Hillsdale, Mich.

WANTED—An industrious, energetic married man with no children. Man to work in rose and violet houses, wife as packer of cut flowers, etc. Wages, combined. $45.00 (forty-five dollars) per calendar month and two rooms free. None but those who have had experience need apply. Anchorage Rose Co., Anchorage, Ky. Chas. Rayner, Manager.

ROCHESTER, N. Y.

Prospects for a lively Easter trade are bright, an unusually large number of advance orders being on the books now, and this fact indicates to our florists a material increase in demand. It is now pretty certain that the supply of cut flowers will be plentiful and of fairly good quality. Lilies will perhaps be the only exception, they are not any too abundant. The bright weather during March has not been favorable for the violets. They are diminishing in size and are faded, but some good flowers, grown in frames, are yet in the market and these are sure of bringing good prices.

We had hard freezing weather for some days, an advantage to all those growers who were trying to hold back their flowering plants, but not in all cases were the efforts crowned with success. Azaleas and genistas suffered most, but after all there is plenty of them to go around. A goodly number of potted H. P. roses are offered in some of the establishments and well flowered Crimson Ramblers in 7 and 8-inch pots with immense clusters are also seen in several places. Metrosideros are finer than ever before in this town. The pretty ericas are seen only here and there and in limited numbers. I have no doubt that many more of these might be disposed of here, but for some reason only a few of our growers seem to have an inclination to handle them.

Excellent large specimens of the old marguerites are met with here and there; the blue daisy is also seen in smaller sizes, thickly set with flowers; lilacs are very abundant; rhododendrons in all colors seem to gain in favor; Spiraea Anthony Waterer has been tried for the first time here and turned out a good subject for Easter forcing; hydrangeas are in fine shape and there is a very generous display of such things as cinerarias, herbaceous spiraeas and deutzias in various sizes. Besides the usual pans of tulips, hyacinths, narcissus and valleys, we see pansies, violets, forget-me-nots and hardy primroses employed for the same purpose. They ought to sell readily for they are completely covered with bloom.

The past week was a rather quiet one and Palm Sunday did not create the usual demand for church decorations, but nobody feels discouraged over the matter, as there is every indication for an increase in this year's Easter trade. May all have the gratification of seeing their most sanguine hopes realized before Easter is over.

Butted Glass.

This is no longer an experiment, it has come to stay. There are various ways of making Butted Roofs, but the best way is with the

Clipper Bar.

With this bar you can make a roof that is absolutely free from drip, and glass cannot be torn out by the wind. Butted glass makes a tight roof, a warm house and saves fuel. It lasts longer, looks better and costs less than the old-fashioned roof. But do not think that this is the only bar we sell, for it is not; we furnish what people want and there is nothing in greenhouse material that you cannot get from us, and all of open-air-dried Cypress clear of bright sap, stained sap, knots and all other defects.

MILWAUKEE.

Easter Supply.

Easter being close at hand all florists are preparing for the final rush for plants and cut flowers. In plants Harrisii and azaleas will fall short of demand but mignonette, hyacinths and callas will be sufficient to go around. In cut flowers a shortage is anticipated especially in carnations and the sudden change to cold weather will have some effect on the calculations of other stock. Bulbous stuff with bright weather will probably be plentiful.

Nic Zweifel will have a fine supply of hyacinths both to cut and in pots, also a fine crop of sweet peas. His Daybreak carnations are looking fine.

F. P. Dilger is most fortunate in having a lot of azaleas in bloom as most all others had them in early this year. He also expects to have a large cut of tulips, hyacinths and daffodils. A. Billings will have the largest supply of Harrisii plants, and Chas. Zipnick, while not in a large quantity, will have a fine lot of perfect plants with heavy stalks and clean foliage from the pot up, averaging about a dozen blooms to a plant, some fine specimens having 15 to 20 flowers. He also makes a specialty of mignonette plants and will have a large supply. The outlook in general is for a large demand in all lines as a good many advance orders are already placed.

Notes.

W. A. Kennedy, of Lake Forest, has leased the Deuster Greenhouses and will devote them to the growing of cut flowers.

H. L. Clapp, of Ripon, and J. E. Mathewson, of Sheboygan, were recent visitors.

GEO. WASHINGTON.

CLEVELAND.

Business has of late continued rather dull, with some surplus of stock, but not much, the late spell of cold weather having a tendency to slightly diminish the supply.

At this writing every one is looking eagerly forward to the latter end of the week, and present business matters interest them comparatively little when compared with what may occur later. There promises to be a good supply of everything desirable in cut stuff, as well as potted stock, excepting carnations, which are completely off crop with nearly everybody, a condition of affairs predicted some time ago. The probability is that a good many people who want carnations will have to content themselves with something else. The outlook for a good Easter seems bright to nearly all the local fraternity. All that is asked is that "Old Probabilities" be kind and send us something extra high-grade in weather. NEMO.

For special prices on fancy and extra grade stock, see our New York letter.

GRAND RAPIDS, MICH.

Weather is cold and raw, greatly retarding the opening of flowers. Carnations are remarkably scarce. Roses will about equal the demand. Out of town orders for carnations are being steadily refused, and even orders placed early are being trimmed down, as there will not be stock enough even under favorable circumstances to fill what orders are already booked. Most of the lilies are poor on account of the disease, although there are at least three fine lots in town and they will be, presumably, equal to the demand. Plenty of bulb stock on hand. Dark violets are practically played out. There will, however, be some fair Lady Campbells, as they did not start a new growth as soon as Marie Louise.

Henry Smith is moving into his new store, and Crabb & Hunter are holding a special Easter sale at 104 Monroe St. Indications are that this Easter will be the busiest ever known.

GEO. F. CRABB.

Good Plants. Healthy Stock. **$5.00 per 1,000.**

A. WASHBURN & SON, Bloomington, Ill.

Always mention the Florists' Review when writing advertisers.

DWARF PAPAYAS.

MOST magnificent Bedding and Decorative Plant over introduced; equal to a Palm in beauty; grows with the rapidity of the **Ricinus;** not affected by drouth. Plants from 4-inch pots, set out 1st June, attained a height of ten feet, and though not watered once, remained fresh and vigorous during the extreme drouth. Send for half-tone illustration showing bed of these plants. Every Florist should have it. Price to the trade $2.25 per doz. for 3-inch pots; all propagated from a tree which has produced this Fall and Winter 192 pounds of its delicious fruit, the largest weighing 12½ pounds.

TARO PLANT.—The genuine Sandwich Islands Taro, entirely distinct from the common Caladium, and a much grander plant in all respects. $1.00 each. Ready May 1st. **Send for Catalogue.**

MARTIN BENSON, Dongola, Ill.

CLEMATIS—Fine assortment 2-year old plants, home grown, $3.00 per dozen.

CARNATIONS—Victor, plants from pots, $4.00 per 100. Rooted Cuttings, $3.00 per 100.

VIOLETS—Princess of Wales, well established plants, 2½-inch pots, $3.00 per 100.

G. EISELE,

11th and Jefferson Sts. PHILADELPHIA, PA.

SPRINGFIELD, MASS.

Piloted by Mark Aitken, behind his nimble steed, a run was made through the principal establishments in the vicinity. J. Schlatter & Son were the first to be visited and we were rewarded with a view of excellent stock in prime shape; but to endeavor to grow yet finer, a good trial with Jadoo is in force and most satisfactory results anticipated.

H. Grout was the next on the list. We found that gentleman finishing the morning cut of that euphoniously-named carnation Conch Shell. It is a beauty, and those unacquainted with the lovely tint upon this species of shell should try the carnation and learn from its bloom what it is in color and vigor of growth.

From thence we sped on to Holyoke, where are located the extensive establishments of Messrs. Shaw and Howland. The stock of the latter is in capital trim. Henry Sinclair knows how to grow Woottons. Easter stock is abundant, and from indications will sell well. Mr. Shaw grows roses and carnations on quite a large scale. His stock is fully up to his usual standard. I looked in at the Aitken place on our return and found considerable improvements since the property belonged to Herrick. It is situated in the heart of the residential section and must be a profitable investment under a careful and hustling person.

W. M.

HEATING.

In reply to B. J. P.'s enquiry on heating matters, the arrangement he suggests would probably provide sufficient grate surface, but the capacity of the boiler would be inadequate for the heating of one house alone, without considering the assistance of some heating pipes which would be necessary in connection with the flue in the second house. I am unable to advise definitely as to the size of boiler which would be necessary, as your correspondent does not state the shape of the houses, whether they are connected or separate, if they have any glass on the vertical sides, and the temperature he wishes to maintain.

New York. H. W. GIBBONS.

HAMILTON, ONT,

E. G. Brown added a violet house in the fall and has had as great success with Marie Louise as is usual with his carnations and roses.

T. V. Kilvington reports considerable demand for palms, and predicts a good Easter.

F. G. Foster is, I regret to report, not feeling so well as of yore. His many friends wish him speedy recovery. The business is being well taken care of by Fred Simon, who is growing some very salable stock.

W. M.

SCOTT'S ROSES...

New Forcing Rose.

Mrs. Robt. Garrett, Hybrid Tea.

Rich, soft pink buds, very long, flower extra large, delightfully fragrant, rivaling Bridesmaid in color, but larger and much more productive. A sturdy vigorous grower. A money maker and a triumph of American skill. The best firms in the country are investing in it. It has won numerous prizes and elicited the most favorable comment from critical judges.

Price, strong plants, from 2½ inch pots, $25.00 per 100. In lots less than 1000 $225.00 per 1000.

Orders booked now, delivery March 15th, 1898. Correspondence solicited.

SPARTA, - - WISCONSIN.

BENCHES.

I would like to ask Mr. H. W. Gibbons why he advises S. H. E. M. to build his benches next to the wall plates instead of having two 69-inch benches and three 18-inch walks in each house. By this plan he would lose six inches of bench room, but wouldn't he have more blooms on account of the gutter plates not shading, and having a better circulation of air all around the benches? B. J. P.

The benefit of the arrangement suggested by B. J. P. would be but slight, and it would be subject to counteraction by the increased range of shade thrown by the gutters, which would necessarily be built higher in order to allow of ample head-room along the line of the side paths. Also, to a beginner the loss of six inches of bench room and the additional cost of construction resulting from the higher side walls, are items worthy of consideration. HENRY W. GIBBONS.

New York.

HARTFORD, CONN.

Stocks are plentiful and prospects good. John Coombs reports a big batch of advance orders. Geo. S. Osborn endorses this and is well pleased with returns since he launched out with three excellent houses, together with shed and office, to which he intends adding. Mr. Osborn is the newly elected president of the Connecticut Horticultural Society, and is a hustler.

PROVIDENCE, R. I.

"Fear not, but put your trust in Providence," is the title of an old song, and judging by the manner of the craft here they are following the injunction to the letter by raising abundant stocks and anticipating good returns at Easter. There seems small doubt but that their hopes will be realized.

A preliminary meeting was held on the evening of the 29th to discuss the question of prices, which promise to be rather stiffer than usual. An adjournment was taken to visit the famous alleys in order to limber up, as it were, for the Easter fray. Our poet-author, J. Austin Shaw, is a cracker-jack at bowling, making a score of 177 and forced to gutter a few to save our Johnny. The writer was in splendid fettle, but must yield the palm to Alex Miller, who is as successful at this pastime as he is at growing roses and carnations. W. M.

SOME ARITHMETIC.

In their advertisement in this week's issue the American Jadoo Co. present some interesting figures as to the comparative cost of Jadoo Fibre and ordinary compost, and show that on account of the saving in size of pots the Jadoo is the cheaper even if the soil cost nothing, and every grower knows that it does cost to make a good compost. This is a phase of the question that touches the plant grower's pocket and will undoubtedly receive careful consideration.

Mr. Fred W. Williams, Stillwater, N. Y., writes: "Jadoo is the finest thing in the world to start seeds in. I would not be without it if the cost was 10 cents a pound. In fact, everything grows and thrives in Jadoo."

PHILADELPHIA.

"The Heacock Wheelmen" is the latest addition to the Florists' clubs of Philadelphia. The officers are: Joseph Heacock, president; Dory Shoher, vice president; James Heacock, secretary; Geo. Farrell, treasurer; Robert Jamison, captain; Patrick Bolland, lieutenant; Charles Vrabec, color bearer.

Other members are Geo. Miles, Victor Ronkins, Christian Haenni, Wilson Mooney, Marshall Rogers and Michael Bolland.

The new organization meets every week at the Heacock Nurseries, Wyncote.

TAYLORVILLE, ILL.—Frank Shaffer, formerly of Pana, Ill., has purchased the Cook greenhouses and will continue the business.

Extra select stock at Kennicott Bros. Co., Chicago. All flowers in season at lowest market rates.

WE HAVE PLEASURE IN OFFERING TO THE TRADE THIS SEASON FOR THE FIRST TIME ONE OF

The Finest Novelties in Chrysanthemums

—EVER SENT OUT—

...MRS. O. P. BASSETT...

It will only be necessary for us to state that **This is a Yellow Mrs. Henry Robinson**

to ensure for it a large sale. It is a sport from Mrs. Henry Robinson, with which variety it is identical in every respect except color, being a delicate primrose yellow, deepening toward the center of the flower. It has been thoroughly tested, and is a novelty of sterling merit. One of the most eminent eastern growers who has tested it states that it is one of the best things in Chrysanthemums sent out in some time. Every Chrysanthemum grower will want it. **A Yellow Mrs. Henry Robinson** will be a money-maker, and a fine exhibition variety as well. Plants now ready for delivery. We have also fine stocks of the other finer introductions of the year—**FRANK HARDY, MRS. H. WEEKS, AUSTRALIAN GOLD.**

Price, $3.00 per dozen; $20.00 per 100.

Wm. H. Chadwick, $6 per doz. The Yellow Fellow, $3 per doz. Pennsylvania, Autumn Glory, Solar Queen, Black Hawk, Quito, Thornden, $5 per doz.; $35 per 100. Boundless Snow, Mrs. C. H. Peirce, Miss Gladys Vanderbilt, $3.50 per doz.; $25 per 100.

We offer also all the best of the **Novelties for 1897,** and the **Best Standard Sorts.** Send for our wholesale list and large descriptive catalogue, giving full list of varieties and prices. We have a very large and fine lot of Novelties in Cannas for 1898, also best and latest introductions in Carnations, Dahlias, Strong Field-grown Roses and other Hardy Plants, a large and fine collection of Palms and other Decorative Plants, etc., etc.

We will be pleased to send our wholesale list and descriptive catalogue to any one who may not have received them.

Grand New Violet "La France."

STRONG VIGOROUS GROWER.
EXTRA FREE FLOWERING.
RICHEST COLOR.

Of the many new Violets introduced in the past few years this, the latest introduction of the foremost French specialist, is unquestionably the **BEST.** It has been thoroughly tested by Mr. Supiot, the Violet expert, who pronounces it "perfect," and flowers which we have exhibited during the past few weeks have been much admired. In vigor of growth, freedom of bloom, and in size and coloring it is superior to all existing sorts, and wlll soon supercede them. Only a limited stock will be offered this season, and orders will be filled in strict rotation

Price, $1.25 per dozen; $10.00 per 100.

HENRY A. DREER, 714 Chestnut Street, Philadelphia, Pa.

A NEW BOILER.

As will be seen by our advertising pages this week there is a new sectional boiler in the market which can be used for hot water or steam heating. It bears the name of an old firm that has always had a reputation for doing good work; the name of the new boiler is the "Weathered." Mr. Samuel Burns, the inventor, is a man of large experience in heating matters, and is always found at his best when working out some knotty problem in greenhouse heating. The business of the Weathereds was established in 1859 by Thomas W. Weathered. Mr. Burns entered his employ in 1868 and has been with the firm ever since. This new boiler shows every evidence of careful study, all the details of greenhouse requirements having been provided for. From a careful consideration of the cuts submitted to us we should say that the new boiler has some entirely new features. We are informed that this boiler has been under consideration for a long time and is the result of careful calculation and experiment. The inventor claims many things for it, and we commend it to our readers as something that may prove of value to the trade. Send for catalogue giving full particulars.

NEW LONDON, CONN.

I spent a pleasant and profitable couple of hours the other day with the veteran John Spalding, whom I found looking over some fine plants of Araucaria imbricata and Gold Queen holly. These were pretty plants, but how insignificant to those noble specimens we have seen flourishing in the northern section of the Emerald Isle. We remember particularly one specimen of the first mentioned towering thirty feet tall and of immense spread, not an imperfect needle or spine upon it. Mr. Spalding also had some well-grown pots of lily of the valley, one of the best lots of Easter lilies I have yet seen, pansies in pans, Dutch hyacinths, a fine bed of antirrhinum Queen of the North, all just right for Easter, while among general stock I noted the very fragrant Lycaste aromatica, an excellent orchid for boutonnieres, and also many aquatic plants. W. M.

GALESBURG, ILL.—Gesler & Robbins narrowly escaped a bad fire the morning of March 26. An overheated steam pipe set fire to some adjoining woodwork, but fortunately the flames were discovered in time to prevent any serious loss.

Jadoo Fibre

...AND...

A Little Arithmetic

"Use pots two sizes smaller than when you grow plants in soil." That's one of our most emphatic instructions. Let's see what it means to you. Here's the way to figure.....

One ton of Jadoo Fibre fills 4000 4-inch pots....

One ton JADOO FIBRE, F. O. B., Philadelphia,	$27.50	4000 6-inch pots (size required for earth), cost alone . . .	$85.50
4000 4-inch pots, ...	31.16		
Cost of Pots and JADOO FIBRE for 4000 plants,	$58.66		

One ton of Jadoo Fibre fills 1150 6-inch pots....

One ton JADOO FIBRE, F. O. B. Philadelphia,	$27.50	1150 8-inch pots (size required for earth), cost alone . . .	$63.28
1150 6-inch pots, ...	25.88		
Cost of pots and JADOO FIBRE for 1150 plants,	$53.38		

Even if soil cost you nothing and gave as good results as Jadoo Fibre could you afford to grow your plants in soil ?

PLANTING AROUND A FOUNTAIN.

Reading the question and answer in No. 18 of the Review, recalls to my mind the planting of a strip around a fountain in the park of Allegheny City, Pa. The strip was six feet wide and was planted with Caladium esculentum, with a border of perillas, I believe. The effect of the caladiums was grand, and nothing could have been finer. HENRY EICHHOLZ.

WEATHERED'S

Improved Sectional Heater.... For Water or Steam

Below will be found a few of the points claimed for this boiler:

Simplicity of Construction. No joints inside the boiler.
Sectional Headers to correspond to each section of boiler.
Sectional Ash Pit to correspond to each section of boiler.
Maximum amount of vertical circulation of water.
Minimum amount of friction.

The heating surfaces in firebox are so arranged that the hot gases must strike every part before entering combustion chamber.
Direct or Indirect Draft as conditions may require.
Smoke Box can be placed on front or back of boiler.
Maximum amouut of heating surface exposed to the direct action of the fire in a given space.

EXPERIMENTS WITH VIOLETS: CONCERNING STOCK.

An experiment was begun upon violets in the autumn of 1896. The plants were bought through a private individual in the open market to avoid any favoritism that might possibly have otherwise been shown the experiment station. Nine lots of plants from widely separated localities were purchased of firms who were advertising violet plants in the leading florists' journals. All nine lots of a hundred plants each were bought for the Marie Louise variety.

The following table gives the number assigned to each lot as it was received, the state from which they were shipped by express, the price per hundred paid and whether the plants were potted or field grown:

No. 1—Connecticut, $4.00 per 100 potted plants.
No. 2—New Jersey, $2.50 per 100 potted plants.
No. 3—Pennsylvania, $3.00 per 100 potted plants.
No. 4—Kentucky, $2.50 per 100 field-grown.
No. 5—Michigan, $5.00 per 100 field-grown.
No. 6—Illinois, $4.00 per 100 field-grown.
No. 7—New York, $6.00 per 100 field-grown.
No. 8—New York, $3.00 per 100 field-grown.
No. 9—Michigan, $2.50 per 100 potted plants.

These nine lots of violets were all true to name except No. 4, which proved to be Lady Campbell.

Deutzia Gracilis, trimmed with white lace ribbon.

The experiment called for fifty-two boxes, two feet square and six inches deep, arranged in thirteen series, and four boxes in each series. Each box received one of each of the nine lots of plants, the position in all boxes being the same, and was as follows:

No. 1.....No. 2.....No. 3
No. 4.....No. 5.....No. 6
No. 7.....No. 8.....No. 9

It will be seen from this that the Connecticut grown plants all occupied the upper right hand corner, while one of the two Michigan lots was in the middle and the other at the opposite corner from No. 1.

Each set of four boxes received a different treatment, but the nine lots of plants had the same range of treatment, and therefore the total output of blooms is something of a guide in judging of the value of each stock. The following table gives the condition of plant at the time of setting out the plant and at the close of the experiment for the average of the set of boxes receiving manure. Fifty (50) was assumed as the standard of the scale for first-class plants, size and apparent vigor being the chief means of judging:

	Grade at Setting.	Grade at end.	Blooms Produced.
No. 1	17	28	9
No. 2	12	5	2
No. 3	22	23	27
No. 4	26	12	12
No. 5	47	62	105
No. 6	42	58	56
No. 7	44	35	33
No. 8	38	48	65
No. 9	35	54	75

From this table it will be seen that there was a gain in the plants in all except Nos. 2, 4 and 7, the increase in vigor being only one point in No. 3. The greatest gain was in No. 5, the plants being so vigorous at the close as to merit a grade of 62. When the blooms are considered it is seen that there were over a hundred in No. 5, the next best being No. 9, with 75 blossoms. The smallest was in No. 2, when the plants gradually "went back," as it is termed. The first four numbers were all poor and the second four were all better than any in the first four, both in grade at time of setting and at the end of the experiment.

That it might be known that there was no influence in the situation in the boxes, a set of the nine lots was grown in a cold frame where the same grading and flower product was maintained throughout the twenty weeks that the plants were under experimentation.

One swallow does not make a summer and one experiment ought not to settle matters that are so obscure as violet troubles, but it is indicated that much depends upon the stock that is used for the growing of violets.

It would be hard to convince the writer that any conditions, however favorable, would have ever made a profit out of the New Jersey plants. These were pot grown, cost $2.50 per hundred and under the conditions that gave 105 blooms for another stock, produced two small short-stemmed practically worthless flowers, while the plants nearly died in the feeble attempt.

It will be seen from the table that of the nine lots four are pot grown; and it was found for the whole experiment that there were two and a half times as many blooms upon field-grown as upon potted plants. While this does not prove the superiority of either method of growing the plants, it suggests the importance of methods, to say the least.

The highest priced plants were No. 7, six dollars per hundred, and this lot was exceeded in blooms, when the

Easter Lilies Dressed with Pink Ribbon and Asparagus.

whole series of fifty-two boxes is considered, only by No. 5, which was the next highest in price, namely, five dollars per hundred.

Upon the other hand, of the three lots costing $2.50 per hundred, the lowest price paid, one, No. 9, stood third in output of blooms. From this last fact it follows that the highest priced plants do not always produce the most blooms and likewise the lowest priced plants do not always yield the fewest flowers. The three lots costing $2.50 per hundred gave about one-half the blooms produced by the three lots that cost $6.00, $5.00 and $4.00 respectively.

While it is seen from this that price does not govern the quality of the plants, the chances of a profitable output are greater with high than with low priced plants; in short, one should be willing to pay well for the best stock.

BYRON D. HALSTED.

Exp. Sta., New Brunswick, N. J.

MISCELLANEOUS SEASONABLE HINTS.

The Easter that has just passed must have taught us some lessons. It was a great Easter undoubtedly and most everything sold, but did you have your stock well balanced? Our experience was that people who wanted to buy, with few exceptions, were better pleased with a dollar plant than one costing more. Many of the orders received from our best friends were for twenty or twenty-five plants, each to be given to a friend. Now this is what sold or would have sold if we had it, so make a note and remember.

Hyacinths.

A single pot of hyacinths sold well at 25 cents each and ten of them in a 10-inch pan also sold at $2 per pan, but as they are entirely ephemeral the customers for them are not so plentiful as pretty girls in June. Another year we shall grow more pots than pans and have them in several sizes. Nowadays, when you have to crepe paper almost everything, the old-fashioned pot is just as acceptable as the pan. Hyacinths in mixed colors did not take at all. Three hyacinths in a 5-inch pot or half a dozen tulips would have sold well. Remember when planting your pans or pots of hyacinths in the fall that the public know enough not to want mixed up colors.

Azaleas.

They were in rather an over-abundance. Some of our people had very large specimens that did not sell, and I would advise my friends to buy in addition to their regular stock, for which they pay 50 cents in Europe, to lay in a stock of azaleas that can be supplied by American houses at about 35 or 40 cents. We had lots of call for an azalea at $1.50. The extraordinary weather of March rushed out most of the Van der Cruyssen, but it is still one of the best. Buy Van der Cruyssen, Prof. Wolters, Memoire de Louis Van Houtte, Bernard Andre, and Bernard Andre alba for Easter and buy Deutsche Perle and Simon Mardner for Christmas. When you sell an azalea to a customer don't forget to tell him that they want to be almost saturated. The little soil we put around them in potting when they arrive takes up about all of the moisture we give them, and the ball of earth in which the feeding roots exist only gets it by what may be called sub-irrigation or rather capillary attraction. The azalea, beautiful as it is, has rather got a "black eye" this Easter, for the reason that they are not sufficiently watered.

Lilies.

Last year I was foolish enough to think that the lily was going out of fashion. This year has proved the contrary. Lilies sold better than ever, and don't forget to buy only of houses that guarantee absolutely sound bulbs. There is a young man in Philadelphia who can spot the unsound from the sound bulbs; his name is "W. C." It would be cheap to hire him at $10 a day to select your bulbs. There has been an awful cry-out about this disease. It is certainly very annoying, but remember the cost of the bulbs is of little consideration. Suppose they cost you double the price; that would be of little consequence. It is the growing that costs the money. So buy the best and do not be hard on the drummer. We grew a good many Japan longiflorums, put them in 8-inch pots, three in a pot, and thanks to the weather they were in full flower and sold at $2 a plant. The Easter lily is always in demand and as it is emblematic of the occasion will never tire.

Roses.

Of all the sweet things that people love the rose takes the bakery. Buy them now and plant out in your own field, farm or garden. The Belgian grown rose is a beauty of the first water. Some twenty years ago I happened to have a lot of young La Reine. They were planted out, made a great

growth, lifted in November, put in a cold frame and brought in just right for Easter, and sold at the magnificent price of 25 cents. You can buy good stock in the autumn of such noble firms as Storrs & Harrison Co., etc., but if you have them on your place how much better to handle them.

The demand for roses in pots was quite a feature. We had a few hundred American Beauties that were just about right, but not half enough to satisfy the customer who wanted a rose for a dollar. What is more profitable? Instead of importing a lot of expensive azaleas grow Anne de Diesbach, even old La Reine, Jacque, Baroness Rothschild, Capt. Christy or almost any H. P., for they all throw up a glorious burst of bloom on their first endeavor. Peter Henderson said many years ago that the name hybrid perpetual was a misnomer, and among other great truths this was one. In our hot and often dry seasons they are not perpetual no more than is an aster. When I last visited the British Isles I expected to see roses by the million. As good a place as you could see them would be the Botanical garden at Manchester. A dear old man, with white hair and sincere piety, showed me around. I expected to see, particularly, the roses and they were a dismal failure, unlike the roses that we knew in our youth. Make up your minds that instead of buying azaleas at a considerable cost that roses in a 6-inch pot with two flowers open and two buds to come will sell at sight. How to just do this will appear in the columns of The Florists' Review a little later.

Cinerarias.

The cineraria as a house plant is a humbug of the first water and not worth any expression of an over-worked intellect. It's cheap, always has been, and although a fairly decent house plant too often succumbs to natural gas and society talk.

Metrosideros (Bottle Brush).

This is really an attractive plant and as the public is always wishing something new, I would advise placing an order for them. It is so novel and unlike anything else that it sells on sight.

Cytisus (or Genista).

It is not my nature to give a plant a bad reputation, but I have this to say, that it is one of the most unsatisfactory plants that you can palm off on a customer. If they will keep it very cool and very much wet, it may last for 48 hours and then the symptoms of dissolution appear. Now is the time to buy young plants of cytisus and plant them out for they lift poorly. Keep on growing them and never be afraid that you are pinching them too much. You can take the shears and clip them as the barber does your hair and it will do them good as it does you.

Mignonette—Violets.

Plants grown in a violet house all winter and were little sturdy plants were lifted about five weeks ago and put in pans. They sold well. Pots of violets sold well and there were not enough to fill the wants of everybody. The way to grow violets in pots is just so: When dividing your plants, or taking cuttings this spring, have several thousand more than you need. Plant in a cold frame end of May or early June. I say cold frame, but no frame is needed until the month of November, then they should be covered with glass. If the winter is what we usually expect, you will not pick violets after Christmas and not again till the middle of March, but they are the stuff from which you are to propagate, because they have not been subjected to any conditions adverse to their normal propensities.

There are three great days when you want violets, that is Thanksgiving, Christmas and Easter, and of course you want them at other times. For two of these big days we can accomplish this by the use of cold frames. You can have them in better perfection in a cold frame for Thanksgiving than any costly house, and certainly for Easter they will be just as prolific, just as sweet and will realize just as many dollars. The violet genus is above all plants the easiest to reproduce from transplanting, so you can lift the dormant plants in February and with judicious treatment have them a lovely gift for Easter. Wishing everybody had as good and profitable an Easter as the old man, I am, most respectfully, WILLIAM SCOTT.

Crimson Rambler Rose trimmed with Lace Ribbon.

THE FLORIST AND THE FLOWER SHOW.

[Read by George C. Watson, before the New York Florists' Club, April 11th, 1898.]

It gives me much pleasure to appear before the members of the New York Florists' Club this evening and tell them what I think of the relations that should exist between the florist and the flower show. I believe I can interest you for a few minutes on that subject without lugging in any of our Philadelphia wheezes about New York being such a sleepy Rip Van Winkle old town. Our friend Lonsdale and some more of his kidney tell me they always like to come to New York when they want a good rest, you know, but I guess that is only just their airy way of getting back at you fellows for some sweet things you have got off in days gone by about Philadelphia—the greatest city in the country—which I could easily prove to your satisfaction with facts and figures, if necessary, only I know that you know it in your hearts.

One thing I will mention, however, and that is that Philadelphia has the finest home of horticulture of any city in this country, if not in the world. Artistically the building is a dream of beauty both externally and internally, and it represents an investment of over half a million dollars. That is something for patriotic New Yorkers to ponder over and is respectfully submitted to the fourth estate. It will be useful stuck up on the editorial desk when the temptation to be witty is strong. But that splendid monument to horticulture, completed but a few years since, took its birth away back many generations ago among the ardent commercial and amateur florists for which Philadelphia has always been noted. These men of old were keen exhibitors. At first they had no home to invite the public to, but had to hire a tent or hall; then they got a modest structure, then a more ambitious one, and finally the present palatial edifice.

The question naturally arises: Does the florist of today reap any benefit from the exhibitions of his predecessor? I answer unhesitatingly, of course he does. Would the present generation be educated in horticulture to its present extent without the stepping stones laid for them by past generations? The commercial florist of today in Philadelphia and Boston and New York and other cities is being benefited by the

Crimson Rambler Rose with Genista Fragrans in Gilt Basket.

seeds that were sown long ago. Not that his predecessors thought much about posterity. What they wanted and what he wants is the applause and the dollars of the living. The flower show was recognized then as a powerful factor in educating the people in this most beautiful art of gardening, and with education came business. It's the same today. Grow things well and get the people to come and see them. The business will grow in its turn, and thrive amazingly in this sunshine of publicity. Look at the chrysanthemum! How many were sold previous to the time you commenced to grow and show them well a dozen years ago, and now look at the myriads of them that are being distributed every year. Look at the carnation, the rose, the lily, the azalea and many other flowers. Exhibitions have done much for all of them, and trade has been greatly stimulated and expanded.

All this seems to go without saying, but for all that, it is surprising to find many commercial florists of the present day who are lukewarm on the subject of exhibitions and who can only be induced to come forward and do their share when hired—that is either with hard cash in prize money or pieces of plate. It seems to me the feeling ought to be just the other way; a commercial florist ought to be so eager to advertise himself by showing his products to an admiring public that he would willingly pay handsomely for the space occupied and consider it a favor and a privilege to be allowed the opportunity.

Another attitude of a great many commercial florists at the present time is, in my poor judgment, wrong. That is to say because the admissions do not pay all expenses, including fat prize money, that the show is a failure. There is surely another criterion to judge by than the box office. A show may be very successful in every way and the public may crowd to see it and yet the expense of getting it up may be so great that the admissions do not cover it. But why should that be cause of despair and much talk about the show having been a failure, and flower shows don't pay, anyway, and all that sort of thing. I think that attitude all bosh. I believe flower shows pay if not one cent is taken in at the box office. And the better they are the better they pay. They pay for the time being and for the future. There is no measuring when their effect stops. They are like a stone dropped in the water. The circles keep on widening and widening and the whole trade reaps the benefit. I believe every florists' club ought to give frequent flower shows, three or four times a year at least. Don't say I am too busy. It is a part of your business. It gives you a chance to meet old customers and make new ones. It is advertising of the most effective kind. Business begets business, and to get business you must make a noise. There is no better way of making yourself felt than through the public exhibition. Experience teaches this, history proves it and common sense clutches it.

If the commercial florists in a community find the presence of a Horticultural Society in their midst let them rejoice. Instead of making a machine to educate their neighbors at great expense here is one ready to their hands and already doing the work. It does not take a house to fall on a man to make him see that, and the potentiality of such an institution for the furtherance of the business interests of the florists' trade. A florists' club can organize a flower show, can run it successfully and achieve great and lasting good, but the individual members can do more with less effort by assisting their Horticultural Society. The Horticultural Society is closer to the general public, who do or may garden for pleasure, being in fact a part of it, and is therefore more powerful because no one can say, "Oh, they have goods to sell." I want to dwell on that point. I think it important. Many will say, a florists' club can run a flower show just as well, nay, better than a Horticultural Society. As to that they may give a better display, but they will not have the same influence with the public. Take the American Carnation Society for instance. The devilish maliciousness of the individual who nicknamed it "the rooted cutting society" is an example of what poison can be injected by a lie that is not all lie and therefore much more deadly than a downright untruth.

On the whole, I think the florist can get the most good out of the flower show if he investigates it through the medium of an amateur organization, but I do not wish to minimize the power of a frank and candid trade show for

advertising purposes. I hope for a great awakening to the possibilities of expanding the flower business in this country by the concentration of attention on the matter of extending the market, increasing the demand. The selling of our product is considerable of a science, as many of our bright growers have found to their sorrow. Many have made the mistake of thinking that anything when well done will sell itself. Don't you believe it. You must first have your public educated up to the point of knowing a good thing when it sees it.

And, gentlemen, in conclusion, that's the nigger in the woodpile. There ought to be a great deal more attention paid to preparing the ground of the public mind, sowing the seed thereon, cultivating, weeding, training, watering it—day in and day out, keeping all the time at it and never letting up. If this thought could be thoroughly worked into the composition of the little army of 15,000 or 20,000 commercial florists in the United States do you doubt for a moment the immense expansion of the business and the honor, glory and profit to all concerned? I don't, for one, and that I take it is the interest the florist has in the flower show, and is the reason why I think all florists should support the same much more warmly than many of them now do. They're a good thing. Ask for them. See that you get them. And for heaven's sake get rid of that insane idea that it is the number of dollars taken at the box office that makes a show successful.

PHILADELPHIA.

A Glorious Easter.

It was a glorious Easter. This is the general opinion. Nearly everybody had a better Easter than last year, and nearly everybody is happy. Last year it was a growers' Easter, and this year it might be fairly termed a dealers' Easter. I do not mean by this that the growers are not content, but that the conditions favored the dealers.

The weather in the early part of the week was below freezing each night, and until Saturday continued remarkably cool for the season. This helped the dealers keep their blooming stock in nice condition, enabled them to deliver it without extra expense for wrapping, and kept the supply of cut flowers down and the quality up, to say nothing of being just right for the shoppers. The growers had more to contend with. The snow storm and cold on Tuesday made delivering plants slow and expensive. The warm weather preceding this week of cold tended to bring the crops of roses and carnations in too fast in many cases.

Prices were good, a little better all around than last year. This was partly due to the really excellent quality of nearly every class of stock; it was worth more and partly, perhaps I should say chiefly, to the demand, which exceeded the supply.

Lilies were very, very scarce. Other flowering plants benefited by this fact, but even other flowering plants did not hold out when good. A great many of the growers sold out clean. It is believed that most dealers did likewise, or so nearly so that what remains will be needed for this week's weddings.

There was some uncertainty about cut flowers early in the week. True, the weather and general business conditions favored good prices, and Secretary Rust, who is well posted, said: "There will be no surplus stock this Easter." Still it was said that S. S. Pennock had submitted his scale of prices to Pennock Bros., and that those astute young men had allowed him to leave without giving an order for fancy Beauties, preferring to wait and see.

With Friday came confidence. The dealers bought freely and prices were firm. Beauties brought $1 to $6 a dozen, and a few are said to have brought more; Brides and Maids, $8 to $12; carnations, $3 to $4, with fancies a shade higher; lilies, $10 to $12, a few selected for shipping orders $15; valley, $3 to $4; tulips, $4 to $5; daffodils, $3.

Lily Disease.

The club meeting held on Tuesday evening was devoted to the lily disease and proved most interesting. The stormy weather and busy season rather diminished the attendance.

President Harris delivered his paper and a general discussion followed, which was participated in by Robert Craig, Henry F. Michell, George C. Watson, Isaac Kennedy, George Anderson and others. The general opinion seemed to be that the trouble was caused by a mite which entered the bulb in Bermuda. It was suggested that various forms of insecticides should be tried. One speaker thought the bulbs ought to be packed in Bermuda for shipment in tobacco dust, with a little sulphur added, using a very tight box, in order that the fumes caused by the action of the heat on the packing material might destroy insect life in transit. A report from the United States Department of Agriculture at Washington says that they do not believe the insects can be killed without injuring the bulbs.

A motion that the club request its members to secure a written guarantee when purchasing imported stock was tabled, the idea being that it was inexpedient for the club to do this, as such a request could not be enforced. It seems to me the club missed a chance to be of service to its members. Such a request is merely a suggestion which, when brought to each member's attention, might save many a dollar.

Notes.

The greatest Easter Philadelphia has ever known.

It is said all the commission men sold out clean.

Violets were very scarce; doubles sold quickly; singles were not very good, as a rule.

Probably the best Beauties coming in are from Edwin Lonsdale's last new house. They are very fine and bring $6 a dozen.

The two largest Easter plant growers, Robert Craig and W. K. Harris, sold out clean, and could have sold many more lilies. J. W. Y.

CHICAGO.

The Easter Trade.

The leading retailers all report a very satisfactory Easter trade, in most cases considerably larger than that of last year. Nearly all noted a further increase in the call for plants.

Mr. E. Wienhoeber did a large business in both plants and cut flowers. He noted, though, that the call was mainly for the more moderate-priced plants and arrangements, and some of his most expensive baskets of plants failed to find customers. The plants and plant arrangements that had the call ranged from $1.50 to $5.00. Of course, many sales were made of more costly arrangements, but the great bulk of the sales were within the range of prices noted. He sold large quantities of pans of hyacinths and other bulbous flowers, dressed with crepe paper. He thought there was rather less call than heretofore for daffodils. He ran short of cut flowers last year and ordered an extra supply this time, with the result that he had some left on his hands, the oversupply being mainly of the higher-priced stock. Still, taking everything into consideration, he is well pleased with results.

Geo. Wittbold did a larger Easter trade than ever before at his North Clark street store, the sales of plants being especially large.

Charles A. Samuelson did a better business than last year, and noted a still further increase in the call for blooming plants. He also noted that the bulk of the sales of plants were of the more moderate-priced ones. He had an extra store and handled a large quantity of plants. Among especially effective arrangements noted in his store were short window boxes of dwarf grown lilies, half a dozen plants in a box, the box covered with green tinted crepe paper, and gracefully arranged baskets of Clothilde Soupert roses. Azaleas seemed to lead in expensive blooming plants. His window display attracted much attention. It was a gracefully arranged group of Adiantum Farleyense, the pots covered with green moss, and in the center a large cross of green galax leaves decorated with clusters of Cattleya Trianae. The store was a mass of blooming plants and arrangements of same in baskets and jardinieres.

In the window of W. J. Smyth appeared a huge cross of lilies among a mass of miscellaneous blooming plants, palms and ferns. His Easter trade was very considerably larger than that of last year, and he also noted a marked increase in the demand for blooming plants. Lilies led in demand, followed by azaleas, hy-

Mr. Geo. M. Stumpp, New York, among his Easter Plants.

brid roses, hyacinths, hydrangeas, and extra fine cinerarias. He thinks that hybrid roses in pots are a coming plant for Easter sales, as they seem to catch the popular fancy and sell at good prices. Tulips did not seem to sell with him, and he will not carry any another year. Hyacinths went well. His last year's experience made him cautious about preparing many expensive plant arrangements and his sales were almost entirely of those of moderate price, ranging generally from $3 to $5.

P. J. Hauswirth's Easter trade was fully equal to that of last year. He also noted an increasing call for plants, but the down-town stores find it difficult to provide the necessary space for handling. A new feature at his store is the utilization of what might be called an upper story show window. It wouldn't be noticed much from the sidewalk, but is sure to catch the eyes of passengers on the elevated road which passes in front.

H. F. Halle found Easter business fully as good, if not better, than last year. The supply was ample and no pickled stock was in evidence. Plant sales were large, lilies leading, as usual. The larger sizes seemed in best demand, such as sold at $1.50 each, and none sold at less than $1. Azaleas went well, especially the larger sizes. In hyacinths and tulips, the light colors sold best, and those in pans far outsold individual plants in pots. Daffodils did not sell well and he had a surplus. Call for palms was light, all seeming to desire plants in bloom. The addition of crepe paper materially helped the sale of plants.

A quantity of left-over spiraeas was noted at several places, and the opinion was unanimous that it was useless to attempt to make the spiraea an Easter plant. Buyers do not want it, and the growers had better save their effort and expense in growing it.

The unfavorable weather undoubtedly lost the retailers considerable transient trade, and had the weather been more favorable, sales would have been noticeably larger.

The Wholesalers.

All the wholesalers report an excellent Easter trade, from equal to last year to one-third larger. The supply was very good, under the circumstances, and everything salable seems to have been cleaned up except some lots of violets and adiantums. Some of the houses had quite large batches of these left over. The small demand for adiantums was a surprise, as was also an apparent falling off in the call for asparagus. Smilax went well.

Bassett & Washburn report the largest business in the history of the firm, as does also Kennicott Bros. Co., and demand has held up well since Easter. Reports were also obtained from E. H. Hunt, Vaughan, McKellar & Winterson, Reinberg Bros., W. E. Lynch, S. B. Winter, E. C. Amling, Rogers Park Floral Co., A. G. Prince & Co., and A. L. Randall, and one was a repetition of the other—good sales all around; wish Easter came oftener.

Various Items.

The McCormick greenhouses at Lake Forest have been torn down, and thus passes away an old landmark in the cut flower growing industry in the vicinity of Chicago. Fifteen years ago these greenhouses sent to the Chicago market about all the "fancy" roses the city could boast, "fancies" at that time including such varieties as Mermet, Perle and Niphetos. They were the first large three-quarter span forcing houses erected around Chicago, and the establishment was considered to be of enormous extent at the time, though the range of glass was a small one compared with many of today.

Mr. W. A. Kennedy, who rented the McCormick houses the last few years, has removed to Milwaukee, and has rented the Deuster greenhouses there.

Mr. John Cook, formerly with W. N. Rudd, at Mt. Greenwood, has rented the Saxon greenhouses at Downer's Grove.

The quarterly meeting of the Horticultural Society of Chicago was held last Saturday afternoon at the Sherman House, but there being no quorum, the meeting adjourned, subject to the call of the president. No use depending upon florists to attend a meeting on the day before Easter.

This Thursday evening (April 14) will be "Private Gardeners' Night" at the Florists' Club.

E. H. Hunt is improving, but is still unable to attend to business. O. W. Frese is also on the sick list.

W. Warnaar, representing Van Heemstra & Co., Sassenheim, Holland, was a recent visitor.

T. J. Corbrey has returned from California, and may resume business here.

ST. LOUIS.

The Easter Trade.

Easter trade in St. Louis was fully up to the expectations of all the florists and the weather was most favorable to the flower buyers. Flowers were not over-plentiful—that is, no glut. The commission men sold out clean and at top prices, claiming they could have sold more if stock could have been had. The bulk of the orders came in at the last moment and compelled the majority of the florists to work half the night, and some all night, in order to get them in shape for delivery early Sunday morning.

Harrisii plants were not plentiful, the supply being short of demand. Pots having from 3 to 4 blooms brought $1, and from 5 to 8 flowers, $2. Azaleas were in good demand, bringing from $1.50 to $3. Hydrangeas and callas sold well at from $1 to $2 each. The report is that this Easter more plants were sold than ever before.

Good, first-class roses were scarce and sold all the way from $8 to $10 per 100; seconds, $6 to $8. Carnations were in good supply and plenty of them to be had, only the white being a little scarce. The poorer grades

brought $2, while the best fancy sold at $6, the bulk selling at $4. Violets were very scarce and only a few Californias came in, and sold at $1 per 100. A few southern arrived from the south and were bought up at 35 cents.

Bulb stuff was very plentiful and, generally speaking, good in quality. Dutch hyacinths and tulips sold at $3 and $4; valley, very fine, $4; Von Sion, $3 and $4. Cut Harrisii reached the $15 mark Saturday morning and sold well; callas, $10 and $12.50, and plenty of them. Sweet peas went up to $2.50 per 100.

Everybody Satisfied.

The down-town as well as the West End florists are very enthusiastic over their Easter business, and it is safe to say that the bulk of trade done was far in advance of any previous Easter week. The majority of the florists had their windows handsomely decorated with hydrangeas, azaleas, palms, araucarias, Harrisii and calla plants.

Among the West End florists, Mr. Robert Ayers, of the Ayers Floral Co., reports business with them the best in years. Plants and cut flowers alike sold well, with lots of funeral work all the week.

At Weber's all hands were busy with plants, cut flowers and decorative work. Business was never better than this Easter.

Connon Floral Co. and Luther Armstrong did a tip-top business; had all they could do to supply the demand and realized good prices.

George Walbart and Mary Ostertag, the North Grand avenue florists, report business excellent and sold out clean. They both made a fine display in their large show windows with handsome plants and cut flowers; trade the best in years.

Robert Tesson, of Ellison & Tesson, reports business at their up and down-town stores great; trade better than ever at Easter time.

Ostertag Bros., Chas Schonelle, and Wm. Oughton, the Washington avenue florists, report business very satisfactory; could have done more had the supply been larger.

The down-town florists all did a great business. Riessen Floral Co. made a fine display at their two down-town stores. Mrs. Buechel reports that they were worked to death; best trade in years.

At Jordan's the display of Harrisii and palms was fine, and Mr. Kunz, the manager, reports trade in excess of last year.

Miss Badaracco, North Floral Co., and Krebs Floral Co. report that trade was fine and could not have been better in plants and cut flowers.

C. Young & Sons Co. were very busy, experiencing the best Easter in years. This firm had the finest lot of Harrisii plants in the city.

The South Side florists speak in the same terms. Fillmore, Schray and Beyer had good plant sales and almost sold out of Easter stock.

Gus Eggling and W. L. Hucke report a rushing Easter trade, with good prices, selling out early Sunday.

The North Side florists, near the cemeteries, Julius Koenig, Sr. and Jr., and H. Meinhardt, report that they were never busier than this Easter.

C. C. Sanders also had a fine trade in plants and cut flowers, averaging better than last year.

Notes.

Rudolph J. Mohr, late with Hess & Swoboda, Omaha, Neb., is now at the Missouri Botanical Garden. Mr. Mohr will remain in St. Louis and will make application for membership in the local florist club at its next meeting.

It is now a fixed fact that the chrysanthemum show this year will be held at the Coliseum, the directors having accepted our terms. The dates are fixed for November 14, 15, 16, 17 and 18. The committee is hard at work and the special prizes are coming in better than last year. This will make it the best and largest show St. Louis has ever had.

Joe Rolker, representing Aug. Rolker & Sons, New York, is in town looking better than ever.

At the bowling club Monday night the attendance was good and some good rolling was done. In the three games rolled Emil Schray was high man with 684; Carl Beyer second, with 576, and Kuehn third, with 559. High single score was by Schray, with 260, Beyer second, with 218; Kuehn third, with 202. Dr. Helwig and Fillmore both distinguished themselves by making 93 and 90 in one of the games.

J. J. B.

WASHINGTON.

Satisfactory Easter.

Easter day opened bright and warm, which cheered the boys who have worked so hard and have been under such a strain the past few weeks in preparing for this event. All seemed to have plenty and all shared alike the prosperity that followed. The week opened with a genuine snow storm, accompanied with high winds. The high winds continued until Friday, making it extremely difficult in shipping Harrisiis. The night temperatures on two occasions during the week fell to 22 degrees, and looked as if Easter day might be frosty, but fortune favored the florists this time and the day was perfect.

The trade in general was very good. High prices were not realized to any extent, few paying more than one dollar. The customers wanted roses for that price and asked for the best for that money. Large plants of azaleas, genistas and hydrangeas did not go very lively; like roses, they gave way to cheaper plants.

Expressions of Opinion.

The market people one and all had congested crowds about, without sufficient help to wait upon them. The accompanying interviews will tell the story:

Mr. Wm. Gude.—"The sale of plants was very much larger than at any preceding Easter. We had quantities and could sell cheap. Large flowering plants not in demand, though sold a few. Church work about as usual. We had about twenty clerks and found even this number inadequate to properly wait on the throngs who crowded the store. We did an immense business."

Mr. J. Louis Loose.—"My cut flower trade was excellent, realizing good prices. The demand was for fine plants, cheap ones not taking. All my ten and fifteen dollar plants are gone, while, as you see, my inferior ones are left. The demand for violets was enormous; I might say the same of carnations. I consider it my best Easter."

Mr. C. F. Hale.—"I don't think there were as many boxes of flowers sent out this Easter as on former years; their place seems to have been taken by plants. The demand was for plants ranging from one to two dollars, not exceeding that. Bulbous stuff seems on the decline. It does not take first place as it did formerly. Violets were inferior and I did not care risking sending them out."

Mr. Otto Bauer.—"As far as I am concerned I had a pretty good Easter. Could have sold double the quantity of violets. People did not want high priced roses; the demand was for cheaper stuff. Carnations were in great demand and the supply limited."

Mr. Blackstone.—"I had a large stock of violets and soon disposed of them. Trade good."

John Graver.—"Harrisiis went off like hot cakes. Carnations and violets sold well. Could not get good prices for roses; demand was for cheap flowers. Foliage plants not even called for. Tulips, jonquils, etc., good."

Robt. Bowdler.—"All the business I could handle, and supply equal to the demand."

N. Studer.—"Business the best we ever had."

C. Schellhorn.—"Sold out my roses early, realizing good prices. Plant trade immense."

Fred Kramer.—"Best Easter we ever had; shipping trade excellent. Sent flowers to Key West and even to Havana last week. Market trade good."

Phillips & Lewis.—"We had to hustle to wait on the crowds, and before night were completely cleaned out. Best Easter we ever had."

The demand for Easter lilies was good, and but few were unsold. Prices obtained averaged about twenty-five cents per flower and fifteen cents per flower, wholesale. There were several thousand more grown in this city this season than last, so that the supply was equal to the demand. W. H. K.

THE WASHINGTON MEETING.

Editor Florists' Review: I feel that I cannot allow to pass unchallenged the report of your Washington correspondent, in your issue of March 31,

Crotolaria Langenstrata.

as regards the entertainment of the executive committee of the S. A. F. in this city.

It appears that the florists of the District of Columbia who ignored the committee now feel slighted at not being invited to the meetings and entertainment. In all the trade papers appeared announcements that the executive committee would meet in Washington, March 15, and in those announcements suggestions were invited from any and all as to the work of the committee. It seems to me that it would have been only common courtesy for the florists who held aloof to have extended a hand of welcome to the members of the committee, and if they had a grievance, to state it to the committee, and not afterward state it in print.

As I personally made the arrangements for the entertainment of the committee, I am in a position to state that they were not made by "a certain government official." Being the brother of the president of the society, it seemed as though it would not be best for me to take the initiative, but after waiting till the Monday preceding the meeting, and finding no steps whatever had been taken, I felt forced to go ahead. My first step was to visit the leading members of the Commercial Florists' Club, including Mr. W. H. K., and ask their opinion in reference to entertaining the executive committee. They each informed me that they could not take any part, under the circumstances, nor could they be present at the banquet, giving various reasons.

I was thus obliged to go ahead without the assistance of these members of the craft, but I did secure the cooperation of Messrs. J. H. Small, Jr., Benj. Durfee, and Wm. Clark. No one was asked to contribute a single penny. Thus it will be seen that the statements of W. H. K. have no foundation in fact. That gentleman must have imagined some things and then taken them for facts. That "a government official steered the party" is untrue. That the florists were not wanted is not so. That there was any effort made to keep the florists in the dark is false. That they were approached on the eve of the banquet and asked to help defray the expenses is also not so. Stick to the truth and everything will be all right. ADOLPHUS GUDE.

Washington, D. C., April 6.

CROTOLARIA LANGENSTRATA.

As swainsonas are now popular attention should be drawn to Crotolaria langenstrata, seen in the illustration, generally known as the "yellow swainsona," little seen in our floral establishments. There are several species, but the one named is the best known in commercial circles. The color is a beautiful saffron yellow, slightly veined with deep red. The leaves resemble those of the clover, except that they are without veins. The habit resembles that of the swainsona, and it requires practically the same treatment. It is useful either as a pot plant or for cut flowers, and grows well planted out. It requires pinching twice before being allowed to flower, and does best in a temperature of 55 to 60 degrees.

Propagation is by either cuttings or seeds, the latter being produced quite freely, but like all perennials seedlings will not give flowers as soon as plants from cuttings. Of insect enemies red spider is the most to be guarded against. B.

BOSTON.

Review of the Market.

Easter week turned out all that could be desired as a successful business investment in the floral line, both for the wholesaler and the retailer. In the wholesale department the run upon roses, carnations and violets was immense, the latter in many instances were very poor, owing to the warm and sunny weather throughout March, but those that were anything like decent flowers were soon sold at good prices.

Carnations were never sufficiently plentiful to supply the demand. I heard one wholesale firm say on one day's sale that thirty thousand had been sent to them and early in the day they were crying a scarcity and in the evening could have disposed of forty thousand more, consequently the price was at all times in the week at the top notch.

Roses were also in great demand and scarce, although extra large shipments were made by some of the largest growers, but every evening closed with the cry of being sold out of most stock.

Lilies, both Harrisiis and longiflorums, were plentiful, but there seemed to be extra demand for church decoration and the many other useful purposes for which these decorative plants can be used at this season. A quantity sold showed the ravages of disease, to which this stock has been subject the last few years.

Notes.

The several proprietors of the leading retail stores vied with each other in making grand and attractive displays in their show windows, and the streets for many yards on each side of their stores were resplendent with floral beauty. The weather from about the middle of the week was all that could be desired, although the early part of the week made many look doubtful and glum, for Tuesday and Wednesday were very unfavorable days for distributing plants, grown under tropical temperature. However, the clearing weather brought a boom with it and successful results emanate on all sides.

Among the visitors to the Hub may be noted Mr. J. D. Thompson and James Hartshorne, of Joliet, Ill., looking for stock to fill a new range of ten large greenhouses over 200 feet long, now under course of erection at Chicago. C. H. J.

NEW YORK.

Among the Wholesalers.

Disappointment and disappointing was business from the standpoint of all the craft, and, as one remarked to me, Easter must now be relegated with New Year's, from a trade standpoint. The word "rush" did not enter into the market from the time the doors opened Monday morning till they closed Saturday night. It is all over now but the kicking, which will undoubtedly come from the grower, who has himself killed the goose with the golden eggs. As usual, there was a perfect famine in flowers Thursday and Friday, wholesalers running hither and thither to find stock, and none to be had, when good prices might have been realized, and then on Saturday all the flowers of Flowerdom dumped on the market, artificially high prices on the start, then a general slump and running to cover, with stock left on hand. Truly, the competition of flowers versus plants has been royal, but plants have come out a long way winner; it was essentially a plant Easter. The fact remains that while the retailer and plant grower prospered, the wholesale man and cut flower grower got left. There is a moral to all this; it is too apparent, however, to have to give any explanation; it is a bald and convincing fact.

Easter Prices.

While the following prices are the highest obtained for some stock, it must be understood that the average was much lower, and I must refer you to the New York market for same, as prices broke considerably after the day opened:

Beauties, of which there was an abnormal glut, the quantity being unprecedented, started at 75 cents for the finest long stemmed, but soon dropped to 50 cents and lower, with large quantities unsold. Maids there were in plenty; Brides, somewhat less, realized for select stock and extra graded $12 to $15 per 100, the general run being from $30 to $60 per 1,000. Meteors and all red roses dragged slowly, the Jack taking the place of the Meteor, being superior in color, size and perfume. The price was low, however, considering the stock, $4 per dozen for the top grade and as low as $10 per 100 for inferior.

There were a few Brunners sold for 60 cents, but the majority of good flowers realized but $6 per dozen; short stemmed, as low as $10 per 100. Very few Testouts came into the market, and $10 was the top price. Morgans and Cusins sold slowly at $6 per 100, while for Perles there was scarcely any demand.

Carnations, which came in larger quantities than expected, were pretty generally cleaned up, ordinary kinds, like Scott, Daybreak and McGowan reaching top price at $5 per 100, running down to $2.50 for inferior stock, while fancy varieties sold from $6 to $8 per 100.

Valley was a glut at the start, but cleaned up pretty good; $3 was gotten for some "extra select," while large quantities were sold for $2 per 100. Harrisii and longiflorums were in fair demand, with unexpected heavy shipments; they realized $6 to $10 per 100, with quite a lot of inferior quality left over from handling. There was no demand for bulb stuff outside of valley and Harrisii, and the bulk of tulips, narcissus and hyacinths is today laying in the ice boxes, unsold.

Purple lilac and mignonette went slowly and adiantum far exceeded the demand. Violets were erratic, a few fine ones selling for $1 per 100, but the bulk went for $3 to $7.50 per 1,000.

Later reports prove that there was a tremendous lot of stuff left over unsold by Monday morning and this most of the finest and most expensive flowers in the market, as American Beauties, etc.

Among the Retailers.

From the retailers' point of view, trade for Easter was very satisfactory. It was essentially a plant Easter of large proportions, with a lot of ribbon, crepe paper, and baskets thrown in. Many opened extra stores, branches and annexes, for the quantity of plants handled was prodigious, and stores were filled with them from cellar to ceiling.

Our illustrations will give a fair idea of the novelties handled and the way of dressing plants in this the Greater New York. The varieties of plants handled were much larger than in former years, and the Boronia elatior, a bushy plant, with aromatic foliage and pretty, deep pink flowers, somewhat resembling in shape lily of the valley, was very novel and attractive. Then there were heaths, epacris, gardenias, rhododendrons, genistas, azaleas, lilies and, last, but not least, the rose Crimson Rambler, an excellent decorative plant and a quick seller, besides lots of miscellaneous bulbous plants, etc., etc. I noted in one store also the variegated foliaged Lilium longiflorum eximium, rather odd, though apparently a very dwarf grower.

The florists pushed plants where and whenever they could, and this is why cut flowers suffered. They had bought their plants, and these had to be sold; if their customers demanded (this is a strong word, but it fits the case), why, they sent out their buyer or telephoned for stock. One of the largest florists in the city did not place any order for flowers at all; he just rested on his oars, so to speak, because there was stock in plenty, and he knew he could get it. He knew he had plants to sell—in fact, plants to burn.

Easter has come and gone, and it is a long wait to Christmas, and the retailer will have a chance to rest from his labors, although I presume there will be lots of weddings and society functions in the near future, unless, perhaps, war is declared next week.

Club Meeting.

At the regular meeting of the New York Florists' Club the smallest attendance was present since the new regime. This can be accounted for by Easter just passed and the members taking a well earned rest after their arduous labors and incidentally to count the shekels gathered in during the rush.

President Plumb was in the chair, and after the usual preliminary proceedings, nine members were unanimously elected and the following gentlemen nominated: W. C. Vanhorne, of the Vanhorne, Griffen Co., New York City; L. C. Bobbink, Rutherford, N. J.; G. Kettel, Seabright, N. J. The standing committee on exhibits made their report.

The Exhibit.

W. A. Manda, Orange, N. J., staged a new seedling, Begonia Rex, very distinct and without any zone, color dark green with silver blotches and markings; awarded a certificate of merit. Also Cobea scandens variegata and a hybrid foliage, Anthurium crystalinum by magnificum.

Mr. J. Carroll, Hemstead, L. I., showed a new violet, a cross between Marie Louise and Swanley White, of a very delicate lavender color.

Mr. J. N. May then introduced the lecturer of the evening, Mr. G. C. Watson, of Philadelphia, who gave a very interesting talk on "The Florist and the Flower Show," which appears elsewhere in this issue.

Mr. Watson brought out some excellent points and a general discussion, in which the advantages of Boston and Philadelphia as flower show cities were compared with New York.

An invitation from the New York

The Horticultural Buildings for Bronx Park, New York City.

Gardeners' Society to confer with regard to holding a fall show was referred to the exhibition committee.

THE HORTICULTURAL BUILDINGS FOR BRONX PARK.

We present herewith an engraving of the conservatories for the botanical garden at Bronx Park, New York City. They were designed by the Lord & Burnham Company, the well known horticultural architects, and will be erected under their direction by a local contractor, Mr. John R. Sheehan.

In all, there are thirteen houses, covering an area of forty-five thousand square feet. The central feature is a palm house one hundred feet in diameter and ninety feet high, from either side of which, running east and west, are two wings, each divided into two compartments, with other houses at the ends, as seen in the engraving. Running south from these are two other low houses that connect with two square ones with cut corners, and running east and west between these are two low houses with octagonal ends, thus making the houses enclose a large court, which is approached from the south. This court will be utilized for aquatic planting and other ornamental features.

The group of houses will stand upon a broad terrace and will occupy a commanding position. The architectural style is mainly the modernized Italian renaissance. When finished, this will be one of the finest ranges of glass in the country.

ROCHESTER, N. Y.

Review of Easter Trade.

Easter trade with the retailers was quite satisfactory on the average, but again there was a marked falling off this year in the public demand for cut flowers of every description, though the increased plant sales swelled the total receipts above the usual figures and our storemen do not complain, for they all were amply prepared to furnish any quantity of flowering plants and in greater variety than heretofore. Some good plants were left over, but most of these may be used to good advantage in the several large decorations which are in prospect during the week, so very little of this apparent surplus will go to waste. Azaleas were in evidence everywhere, some of them a little on the passee, but selling quite well after all. Specimens and half specimens did not move so readily as was anticipated. Plants worth from $1.50 to $2.50 were sure of finding a purchaser while anything larger than that or higher in price would only occasionally be called for, and it is mostly these sizes which were left behind. Roses in pots sold remarkably well and good prices were realized.

All the lilies were disposed of. This was the only article which could be called scarce, yet the supply was in reality as good and abundant as last year. Rhododendrons and kalmias sold only fairly well; quite a few of these are left in the houses. Lilacs were too plentiful. Hyacinths in pans, especially the larger sizes, were highly appreciated and other bulbous stuff found equal favor. Spiraeas and miscellaneous plants were quite plenty; a good many of them are on hand yet, while hydrangeas, though not at all scarce a few days ago, are now nearly all gone, excepting a few which are not fully developed.

In cut flowers the prices were kept a trifle above last year's figures, though the demand was not as brisk, only a few of our retailers had laid in as large a stock as usual for the occasion, but nearly every one had more on hand than was needed. Bulbous stuff, mignonette and violets were decidedly in excess. Roses and carnations sold fairly well, yet there was more on hand than could be used. People were inclined more than ever to expend their money purchasing a pretty plant of some kind rather than invest the same amount in cut flowers, which in a day or two have to be cast away, while a potted plant will continue in good shape for a week or even a month; they have learned that much from experience.

The weather was very pleasant and favorable for the delivery of goods, no extra wrapping to protect against frost was needed as in former years, saving much time and extra labor to our overworked storemen and their employes. K.

TRY AN ADV. in the Review if you have any surplus stock to sell to the trade.

COPYRIGHT 1898.

FREE FLOWERS AND PLANTS.

We note a tendency in some quarters to be sarcastic about the efforts of the Washington florists to stop the wholesale giving away of flowers and plants by the public greenhouses to parties with a political "pull." And we also note an attempt to cover up the iniquity by sweet sounding phrases to the effect that such use of the public property is really to the advantage of the florist in more widely disseminating a love for flowers.

The efforts of the Washington florists in the line indicated are to be warmly commended, and should be indorsed by every honest citizen. The keepers of public greenhouses have no more moral or legal right to give away their productions than the keeper of the mint has to give away the money coined.

And that the flowers and plants given away by public institutions are of any direct or indirect benefit to the trade is simply nonsense. It is the love of getting something for nothing that is disseminated, rather than a love for flowers. And the trade doesn't need any assistance from the government. Neither does it ask any government official or employe to commit a breach of trust in order to assist it.

The productions of the public greenhouses are for the benefit of the whole public, and not for those who happen to have political influence. And the growing in quantity of the usual commercial flowers in a public greenhouse is prima facie evidence of an intent of the official in charge to make an improper use of same, for in no way can the intent of the law be so contorted as to include the growing of cut flowers for the purpose of free distribution.

THE PRESSWORK on the last issue of The Review was accomplished with great difficulty, on account of the widespread strike of pressfeeders in Chicago. As a consequence, the quality was not up to our usual standard, and there was a delay in mailing part of the edition. The strike has now been adjusted.

ADIANTUM FARLEYENSE.

The well deserved title of "Queen of the Maidenhairs" has sometimes been applied to this lovely fern, and in truth it is one of the most beautiful of all ferns, and having been so extensively propagated of late years it has become so widely known that an extended description seems scarcely necessary in The Florists' Review.

It may be stated, however, for the benefit of the younger brethren, that A. Farleyense is a native of Barbados, and that botanists have decided it to be not a species, but a form of A. tenerum, the latter being a handsome, strong-growing species with much smaller pinnae than those of A. Farleyense.

Adiantum Farleyense.

There does not seem to be a very clear knowledge among the authorities as to the exact location from which this fern was originally brought, some stating that it was found at a place called Farley's Hill, and others that it has been named for the reputed discoverer, one Farley, and a decision will not be attempted by the writer, but the fact remains that whatever be its origin we have here one of the gems of the genus.

A. Farleyense is a warm house fern and enjoys moderate shade and plenty of moisture, and since its wants have been better understood has been grown very successfully by many cultivators. One of the chief essentials to its welfare is a strong soil, and some of the best plants I have seen have been grown in rather coarse turfy loam, with about one-third of dry cow manure, the latter being broken up into small pieces and thoroughly mixed into the soil.

When newly potted careful watering is needed to avoid souring the soil, but once established liberal supplies of water can be taken up. Careful ventilation is another step to success, for, though this fern requires plenty of fresh air, yet the young fronds are quite susceptible to cold draughts.

Division of the crowns is the method of propagation generally practiced, an old plant being shaken out and divided into almost as many pieces as there are fronds (owing to the multiplicity of the crowns) and these pieces being planted in light soil and properly cared for in a warm propagating frame will seldom fail to grow.

Seedlings of A. Farleyense have been reported at various times and places during the 30 odd years that it has been in cultivation, but it has never been the good fortune of the writer to see any, and while the indusiums are not infrequent on old plants, yet in but one instance have I found spores therein, and then failed in germinating them.

W. H. TAPLIN.

THRINAX PARVIFLORA.

The thrinax include some ten or twelve species of rather dwarf-growing palms, several of which have been in cultivation for many years, though but seldom seen among the stock of commercial places.

This fact, however, is not by any means owing to a lack of beauty or gracefulness in the genus in question, but rather to their comparatively slow growth as young plants, the commercial florist of the present day finding it necessary to place the most reliance on quick-growing crops, in order to utilize the space at his command to the very best advantage.

The species specially referred to in the present note, T. parviflora, and which we also illustrate in a moderate sized specimen, was introduced from Jamaica over one hundred years ago, but is still so little grown, in this country at least, that an order for one hundred plants of a given size would probably be declined by a majority of our leading palm growers.

T. parviflora is a slender growing plant, with much divided fan-shaped leaves, that ultimately attain a diameter of about two feet, and are supported on slender petioles that extend almost horizontally from the stem. The whole plant is unarmed, and the foliage is smooth and of good texture, bearing considerable exposure without injury. Some species of thrinax occasionally sucker from the base, but I have never seen T. parviflora develop that habit, its usual form as seen in commerce being that of a light-looking, single-stemmed plant.

The seeds of thrinax are rather small and roundish (about the size of a large pea), and germinate freely in a warm house, providing the seeds are fresh. The seedlings are slow in growth for the first two years, and are also susceptible to over-watering, but do not seem to gain much by being grown in a very high temperature, the latter condition furnishing better opportunities for the attacks of insects.

From the fact that this palm seldom grows more than ten to twelve feet high, it seems likely that in its native country it is overshadowed by larger species, and this gives us a hint in the matter of shading, a process that is beneficial to the plants in question, while in regard to temperature we find 60 to 65 degrees answers very well.

W. H. TAPLIN.

Thrinax Parviflora.

DREER'S NURSERY.

Riverton, the home for flowers, is too well known to give any detailed description of the extent and glories of the greenhouses and their contents. At the same time, a passing glance and a casual allusion to some of the most striking subjects and novelties to be seen at this model establishment would not be entirely out of order.

Mr. Always Busy Eisele is never too busy, however, to escort you through the labyrinth of glass and plants, and as you start off, Lieutenant Strohlein wishes you god-speed in case you should get lost in the forest of greenery and never return.

At the time of my visit, just before Easter, the packing shed was filled with orders, the demand for azaleas having necessitated an extra "shift" in this important branch. Palms there were by the acre, and azaleas, too, one solid bed of the latter measuring 250x 25 feet. The varieties grown for Easter were chiefly Empress of India, Vervaeneana, Bernhard Andreas Alba and Mme. Van der Cruyssen.

Always having had a reputation for ferns, it is only necessary it should be kept up, and many novelties are to be seen, the following the most striking:

Adiantum Clowesii, a variegated form of Adiantum Sanctae Catherinae and Adiantum lineatum, a variegated form of Adiantum Macrophyllum; both very unique. Adiantum Victoriae Eiselanum, a selected form of Adiantum Victoria, is sure to find favor as a jardiniere plant. Adiantum Versaillense, a crested and tasseled form, with pendant-drooping fronds. Adiantum Lambertianum, a dwarf of compact growing variety, like Adiantum gracillimum, and a possible hybrid between it, and Adiantum cuneatum, are also to be seen.

Pteris biaurita argentia, a dwarf form of Pteris argyraea and likely to prove very serviceable as a jardiniere plant. Pteris Wimsettii is a very distinct variety, like Pteris serrulata cristata, with the habit of Owardii, but more crested, and the pinnae more prominent on the fronds. Pteris serrulata voluta is a variety with a peculiar drooping habit, giving one the impression at first sight that it is wilted.

Polystichum coriaceum, a distinct and useful variety, either as specimen or jardiniere, was noted. Asplenium obtusilobum, a dwarf, compact variety, has a future before it, as it is of hardy constitution and very pretty.

Dracaena Godseffianum is particularly distinct, with its aucuba-like foliage. It is easy of propagation and will doubtless prove a useful commercial variety. Nicotiana collosea variegata will prove an acquisition to the bedding plant collection. The va-

riegation is very distinct and handsome, the leaves at maturity forming a striking contrast.

Of the newer varieties of Begonia Rex, Princess Charles of Denmark was the most striking, with its "zones" of soft pink and darker background. Sander's Masterpiece is an excellent dark variety.

"Down where the water lilies grow" are to be seen several novelties and Victoria Regias in their infant state. Mr. W. H. Neptune Tricker, who presides over the mermaids in this department, was building an elaborate rockery for the display of this interesting class of plants when your correspondent called, and volunteered the information that it takes "rocks" to build anything of that kind; as we agreed, there was no argument on this point.

We have had the chrysanthemum r(age), we have had the carnation r(age), but the dahlia will next command attention. Mr. Eisele informed me they had sold more dahlias thus far than for any previous four years, and the report seems to be pretty general.

I was sorry I did not meet Mr. W. F. Dreer, to congratulate him on the excellent appearance of his stock, and so I take pleasure in assuring him this way from an unbiased standpoint.

A. RECA.

BUFFALO.

The Easter Trade.

The first days of the week were cold and bleak, but bright, then Thursday, Friday, Saturday and Sunday seemed to vie with each other as to how beautiful they could be. Poor Thursday was not in it, Friday held a full house, Saturday was four aces and Sunday made them all lay down. Never in the recollection of the oldest florist (and we can remember the battle of Waterloo) has such perfect weather prevailed. It was not only comfortably warm, but better still, there was not enough air stirring to divert the industrious bee from his direct course while seeking nectar from the first opening blooms of spring.

It is slightly premature for me to say just what the business was, and what I would say would be decidedly prejudiced by my own experience, but the "dicky bird" says there never was an Easter like this. In another column will be found my impressions of what we ought in future to prepare for this day, which has now become "a great day." Jew and Gentile, patriot, patrician and plebeian, Presbyterian and Megatherian all seem alike to celebrate this day, and when it is accompanied with climatic conditions such as we have just experienced it is enough to make you embrace the man to whom you loaned ten dollars last week.

Cut flowers were simply not in the race. John Dunlop's roses were here and his Bridesmaids had three feet of stem, the flowers were seven inches long and weighed half a pound, but even this quality did not attract the public nearly so much as a pretty plant. Here is a sample order verbatim, and it fills the bill better than any abstract account I can give:

Sandringham Hall, Suffolk, England.
My Dear Mr. Scott:

Send two dozen of my best friends in America a nice plant each, not to exceed two dollars in cost, lilies preferred. Draw on me after the Darby.

ALBERT EDWARD, P. of W.

There was nothing like it, and he that didn't do well or feel well is a turned down page that will never be opened again, unlike Gray's immortal "Elegy," or Robbie's "Tam O'Shanter."

Violets were really the only flowers that were short in supply. One florist was several thousand oversold on violets and another that we know well had to substitute long-stemmed orchids in place of them.

A fuller report of the Easter trade will appear next week. I have only this to say now: That a pretty, inexpensive plant was in greatest demand this Easter.

W. S.

Carludovica Atrovirens.

CARLUDOVICA ATROVIRENS.

Though frequently considered among palms and grown with them, yet this handsome foliage plant is not a palm, being more nearly related to the pandanus family. The species illustrated has been in cultivation for many years, but does not appear to have become common in the trade on this side of the ocean, and as a matter of fact is seldom met with outside of private collections.

C. atrovirens is a stemless or nearly stemless plant of bushy habit, the leaves of which are bifid, plaited somewhat like those of a curculigo, and very dark green, as indicated by the specific name.

This plant grows freely in a warm house, and is not hard to please in the matter of compost, but makes more rapid growth in light, rich soil with good drainage, the latter point being the more necessary from the fact that an abundant supply of water is needed for its welfare.

Propagation may be effected by seeds when these are obtainable, but more often depends on division, as C. atrovirens produces suckers freely, and by

The Right Cypress for Greenhouse Material.

Have you heard of Cypress Greenhouse Material that has not been satisfactory? If you have it does not follow that Cypress is not the best lumber to use. There is White Cypress, Yellow Cypress and Red Cypress; there is Cypress that grows on the high lands and Cypress that grows in the swamps.

All of these different kinds are not suitable for greenhouse purposes. Do you know which kind is best and do you know that kind when you see it? If not you would better buy from those that do know and will deliver exactly what they sell. We introduced Cypress for greenhouse construction and pushed it to the front. We know all about it. For fifteen years we have made a specialty of furnishing it, and during this time we have built up a reputation that we can not afford to jeopardize. We send out the best only.

Write for Circulars or Estimates.

Lockland Lumber Co.

LOCKLAND, OHIO.

CATTLEYA LABIATA!

Fresh imported plants of this free growing and flowering variety, at $50.00 per case of 50 plants, or $90.00 per 100, every eight good bulbs to be counted one plant.

Just arrived in fine condition, ONCIDIUM VARICOSUM ROGERSII, $1.50 each; $100 per 100; 25 at 100 rate. Lælia purpurata, expected to arrive by next steamer from Santa Catharina. Cash or satisfactory references required from unknown parties.

ADOLPH A. SACHSE, ORCHID COLLECTOR **Newtown, L. I., N. Y.**

washing out the roots these suckers may be separated from the parent plant without difficulty, and soon become established plants.

The carludovicas are said to be natives only of tropical South America, where a number of handsome species have been found, one of which, C. palmata, possesses additional interest on account of its leaves furnishing the material for the so-called Panama hats, those luxuries of summer dress that are unfortunately beyond the purse of the average florist. But we may be permitted to grow a plant of Carludovica palmata, and by exercising the imagination we may see the patient South American native selecting one large young leaf, carefully removing the stiff veins or ribs from it, then slitting it into narrow strips and finally plating it into a shapely head cover without separating the strips at the stem end. Such ingenuity deserves a proper financial reward, but in all probability the larger portion of the profit is secured by the European or American hatter, who ultimately retails the product.

W. H. TAPLIN.

FLORICULTURAL NOMENCLATURE.

The nomenclature committee of the Society of American Florists is desirous of laying before the society any cases of misnaming or double naming of plants handled by the American trade, which ought to be considered by the society. Any cases coming under the jurisdiction of this committee should be reported to the undersigned, not later than the 1st of July, with full indication of the circumstances and the parties involved.

WILLIAM TRELEASE,
Chairman.

Missouri Botanical Garden,
St. Louis, Mo., April 1, 1898.

SYCAMORE, ILL.—John Gustafsson has leased the Partridge greenhouses, but will not take possession till June 1.

WANT ADVERTISEMENTS.

SITUATION WANTED—By a thoroughly practical gardener and florist to take charge of private or commercial place where wages would be commensurate with results; responsible references. Address A. M., care of Florists' Review, 56 Pierce Bldg., N. Y. City.

WANTED—A first-class grower who knows enough to run a place on business principles, to buy one-half interest and take full charge; must thoroughly understand the business. If dissatisfied with his purchase any time within one year he can have his money back. For particulars address A. H., care Florists' Review.

SITUATION WANTED—By a first-class grower of roses, carnations, violets, etc.; 12 years' experience and can furnish best of references. Address Practical care Florists' Review.

SITUATION WANTED—By experienced gardener: single, 25; in private place; understands care of greenhouses, fruits, everything in general; best of references; California preferred. Address P. Hanson, box 251, Mamaroneck, N. Y.

SITUATION WANTED By practical, up to date florist and gardener; private or commercial place, eastern and western experience; first-class references from well known parties. Address A. M., care Florists' Review.

FOR SALE: 1 dwelling house, 2 greenhouses, 17 x 150 newly built; well located and good home trade, on st. car line and near a city of 300,000 population. For particulars address P. O., care Florists' Review.

SITUATION WANTED—By A1 grower of roses and other cut flowers and plants, as working foreman; has held similar positions in Chicago; best of referenccs. Address E. C., care Florists' Review.

SITUATION WANTED—By a first-class florist; single, German. 36 years of age, with 20 years' experience in growing roses, carnations and general stock; can furnish best of references. H. C., care of Florists' Review.

SITUATION WANTED—By florist and gardener; good grower of roses, carnations, mums and general stock. Only those in need of a good man and are willing to pay fair wages need apply. Address K. K., Florists' Review.

FOR SALE—Six greenhouses, about 14,000 feet of glass; well stocked; wholesale and retail town of 4,000; no competition; less than 100 miles from Chicago; two railroads; good seed trade. For particulars address A, care Florists' Review.

WANTED—Six or eight good men for potting and assisting in the greenhouses; fair wages and steady employment given. Do not write, but make immediate application at greenhouses in Hinsdale.
Bassett & Washburn, Hinsdale, Ill.

SITUATION WANTED—An experienced florist (of 20 years) and wife wish a situation to run a flower store or work in greenhouses as makers up of florists' designs. Best of references. Man a total abstainer.
Address Florist, P. O. Box 256, Tuscola, Illinois.

WANTED—Two good greenhouse assistants; please give experience, references, etc.; wages, $9.00 per week. Address J. A. Peterson, 105 E. 4th St., Cincinnati, Ohio.

WANTED—Gardener for private place near Chicago. Call at 552 Dearborn Ave., Chicago.

SITUATION WANTED—By thoroughly practical all round gardener. Capable of taking entire charge of a gentleman's private place. Exceptional references as to character and ability. Address Gardener, care of Florists' Review, 105 Hudson Street, New York City.

SITUATION WANTED—By a competent florist and gardener, 14 years' experience in growing cut flowers, tropical plants, cyclamen, etc. Also a first class designer and decorator. Capable of taking charge of place of any extent. Age 30, single. R. S., care Florists' Review.

SITUATION WANTED—By first class rose and cut-flower grower who understands the business in all its branches and is thoroughly capable of taking full charge of large plant. Am employed at present but have good reasons for wishing to make a change. Unquestionable references. Add. 320, care Florists' Review.

SITUATION WANTED—By expert grower of plants and cut flowers. Competent in every department. Seeks a situation where he may have a chance to make his services worth more than in his present place. Can surely advance his employer's interests if given suitable opportunity. Address S. D., care Florists' Review, Chicago.

WANTED—A working foreman, must be an A 1 rose grower, American preferred, but must be able to furnish the best of references. No fakes need apply. The plant is backed by wealth, therefore, will have none but the best. A good salary will be paid to the man who can prove his ability. In writing, send copies of recommendations and address. Address L. T., The Florists' Review.

WANTED—At once, good florist for greenhouse work. $20.00 per month, with board. Advance in wages if satisfactory. Hillsdale Floral Park, Hillsdale, Mich.

WANTED—An industrious, energetic married man with no children. Man to work in rose and violet houses, wife as packer of cut flowers, etc. Wages, combined. $45.00 (forty-five dollars) per calendar month and two rooms free. None but those who have had experience need apply. Anchorage Rose Co., Anchorage, Ky. Chas. Rayner, Manager.

AN UNPARALLELED SUBSCRIPTION OFFER.

EVERY one to whom this issue of the FLORISTS' REVIEW is addressed, and who fills out, signs and returns the accompanying subscription blank, accompanied by $1.00, within 30 days from date, will receive not only the FLORISTS' REVIEW for one year but also a certificate entitling him to the earnings on one-tenth of a share of stock in the company formed to publish the paper. The shares will be of a par value of $10.00 each.

Why do we make such an unparalleled offer? It is very simple.

You will have an interest in the success of the paper.

You will see that you can buy everything that you want to just as good advantage from advertisers in the FLORISTS' REVIEW as elsewhere and at the same time benefit yourself by increasing the earning power of your certificate.

This mutual arrangement cannot fail to bring to the paper a heavy advertising patronage, and as a result the stock represented by your certificate will earn good dividends.

And the more you buy of advertisers in the FLORISTS' REVIEW (always mentioning the paper) the larger your dividends will be.

You will get a better paper than has yet been published in this field, and a share of its earnings. Please let us hear from you by early mail.

Florists' Review

When Writing Advertisers.

SOCIETY OF AMERICAN FLORISTS AND ORNAMENTAL HORTICULTURISTS.

OFFICERS.

Pres., Wm. F. Gude, Washington, D. C.; Vice-Pres., A. Donaghue, Omaha, Neb.; Sec. Wm. J. Stewart, 67 Bromfield St., Boston, Mass.; Treas., H. B. Beatty, Oil City, Pa.

"NEXT MEETING."

The fourteenth annual convention will be held at Omaha, Neb., August 16, 17, 18 and 19, 1898.

The Trans-Mississippi and International Exposition will be held in Omaha, June to October, 1898. F. W. TAYLOR, Supt. of Horticulture.

OMAHA, NEB.

Easter trade has been very brisk and the weather was all that even florists could wish. Lilies sold from $10 to $15, according to quality, all the best ones being disposed of by 4 o'clock Saturday afternoon. Azaleas, spiraeas, cinerarias, hyacinths, etc., sold at good prices. Roses brought from $1 to $1.50, carnations 50 to 60 cents per dozen. Bulbous stuff did not meet with so good a demand as in former years; it seems evident that the carnation has crowded them out. Flowers of all kinds were plentiful.

Some of the leading grocers handled lilies, much to detriment of the florists, as they were sold for 5 cents per flower, being satisfied to realize 25 per cent profit. Some of these grocers consider it a novel addition to their business, apparently not realizing that a florist could not exist on 25 per cent profit. J. J. H.

DETROIT, MICH.

The Easter rush is over again for a year and the florists all wear a smile a yard wide. There was a good supply of everything but Harrisii, carnations and violets. Roses were of good quality and in sufficient quantity.

Holtznagle cut some very fine Brunners. Breitmeyer & Sons had a few plants of Crimson Rambler rose which sold like hot cakes. Sullivan says he could have disposed of more azaleas of medium size and that bulbous stock was a drug, but is well satisfied with sales in general.

The Floral Co., Ferguson and Taepke all report sales larger than last year. Rackham was the only grower too late with his Harrisii, but expects them for Decoration Day. RAG.

IF YOU HAVE anything to sell to the trade, offer it in an adv. in The Review.

IT WILL BE to your advantage to mention The Florists' Review every time you write an advertiser.

YOU CAN BUY all your trade supplies to the very best advantage from advertisers in The Florists' Review, and at the same time advance the interests of your paper.

Always mention the Florists' Review when writing advertisers.

Jadoo Fibre Grows Prize-Winners

Grand New Violet "La France."

STRONG VIGOROUS GROWER.
EXTRA FREE FLOWERING.
RICHEST COLOR.

Of the many new Violets introduced in the past few years this, the latest introduction of the foremost French specialist, is unquestionably the **BEST.** It has been thoroughly tested by Mr. Supiot, the Violet expert, who pronounces it "perfect," and flowers which we have exhibited during the past few weeks have been much admired. In vigor of growth, freedom of bloom, and in size and coloring it is superior to all existing sorts, and will soon supercede them. Only a limited stock will be offered this season, and orders will be filled in strict rotation

Price, $1.25 per dozen; $10.00 per 100.

HENRY A. DREER, 714 Chestnut Street, Philadelphia, Pa.

A GOOD ANTISEPTIC.

As a good many florists suffer more or less by lacerations from the thorns of roses, more specially during the holidays when the rush is on, a friend of mine who has been in the hospital from blood poisoning, the result of the above, says that the doctors told him in future to use this precaution:

Get a bottle of corrosive sublimate tablets, costing 25 cents, from any drug store. Dissolve one in one pint of water and bathe the hands for several minutes with same; this is an excellent antiseptic, but deadly poison for inward application, so care must be used in handling and leaving the tablets where they might prove dangerous. B.

HUNT'S REVIEW OF THE CHICAGO MARKET.

The entire past week, beginning Wednesday last, has been one continual hustle—orders upon orders from all quarters. The business done, as predicted by us two weeks ago, far exceeded all previous years here for past six seasons.

Stock was mainly good. There was a noticeable absence of pickled stock, not that there was none at all, but the percentage was smaller than the most hopeful expected.

The main shortage as expected developed on carnations and Harrisii—both at times being far short of demand and going at high prices, Harrisii Saturday going to 18 cents with everything counted.

Close of business Sunday noon found wholesalers as a rule completely sold out and while in a rather collapsed condition physically, mentally in a happy frame.

The installation of the new board of aldermen Monday kept local business lively and even Tuesday was only a minor edition of a day of Easter sale. Beginning with to-day (Wednesday) business will quiet down in all probability and suffer as usual probably from the customary reaction.

Carnations are still short crop. Violets of good quality also are somewhat shy, all other stock in good, fair supply, in some lines even in overstock.

The outlook for a good spring business is hopeful and a more healthy tone has not prevailed at this period for years.

Always Mention the....

Firefly for Easter

Produced more good blooms than any other Carnation on our place. Bright scarlet and blooms continuously from early to late.

$10 per 100; $75 per 1000.

GEO. HANCOCK & SON, Grand Haven Mich.

New Forcing Rose.

Mrs. Robt. Garrett, Hybrid Tea.

Rich, soft pink buds, very long, flower extra large, delightfully fragrant, rivaling Bridesmaid in color, but larger and much more productive. A sturdy vigorous grower. A money maker and a triumph of American skill. The best firms in the country are investing in it. It has won numerous prizes and elicited the most favorable comment from critical judges.

Price, strong plants, from 2½ inch pots, $25.00 per 100. In lots less than 1000 $225.00 per 1000.

Orders booked now, delivery March 15th, 1898. Correspondence solicited.

ST. PAUL, MINN.

The Easter Trade.

Easter trade was good. The weather was perfection itself, stock was good, prices moderate and customers plentiful; and what was more to the point, every one bought more freely and larger orders were given than for several years. In cut flowers, carnations for once were more in demand than roses, selling at the uniform price of 75 cents per dozen at retail, a few fancy going at $1. The supply was short of the demand and several thousand were shipped in from eastern points. Roses also were in good demand, retailing at $1.50 to $2.50 per dozen. One feature of the trade this year was the small demand for white roses, other varieties selling more readily.

The supply was about equal to the demand, though large shipments came in during the week; one Chicago firm sending here and to Minneapolis over 10,000 choice blooms. Beauties were in good demand with a good stock to select from, most of it coming from outside. Violets were in great demand with the supply somewhat short at the end of the week. The local growers all had good crops of violets and stock was of good quality considering the lateness of the season. Cut lilies were in excellent demand and more good flowers were disposed of in this manner than ever before. Bulbous flowers were plentiful and in good demand, the end of the week finding stock pretty well exhausted.

As a whole cut flower stocks were never better, even shipped in blooms being in elegant shape, consequently a smaller number of kicks than ever.

In the plant line lilies, as usual, were most in evidence and most in demand. Azaleas, as usual, sold well, Van Der Cruyssen being the favorite variety. In the plant line, as in cut flowers, people are disposed to prefer bright colors. Hydrangeas and cinerarias sold readily, while spiraeas went at sight. Hyacinths sold fairly well while other bulbous stock in pots and pans was a drug in the market.

Lilies retailed at 20 to 25 cents per bloom, azaleas $1.50 to $5 each, spireas 75 cents to $1, hyacinths 15 to 25 cents per pot. Some pans of lilies, 3 to 4 plants to a pan, were noted, but sold slowly. The best selling lilies were medium sized, 3 to 6 blooms each.

CHARLOTTE, N. C.—E. J. Bush recently added a fine rose house. The demand for roses increasing necessitated a home supply as far as possible. Mr. Bush is building up a snug business, and at the same time paying close attention to the pretty park under his charge.

IF YOU want to buy you will find it to your advantage to buy of the advertisers in The Review. If you want to sell, you will find it to your advantage to advertise in The Review.

VIOLETS—Princess of Wales, well established plants, 2½-inch pots, $3.00 per 100.

G. EISELE,

11th and Jefferson Sts. PHILADELPHIA, PA.

CLEVELAND.

Resume of Easter Trade.

Although at this writing it is still too early to get any very definite and detailed information as to the business done at Easter, there can be no doubt, from the general statements made, that on the whole it has been very good. Cut flowers sold well and plant sales cut fully as great a figure as at any former Easter time.

Reports so far as received conflict somewhat in the details, some being under the impression that this outsold that, while some one else claims the reverse to be true. Only a little more time to allow the smoke of conflict to clear away can justify more than general statements.

Carnations sold well and were short in supply with many. Two or three report enough to fill all orders. Lilies, both cut and as pot plants, were in good demand. Azaleas sold well, although so far as reported there seems to have been a sufficient supply in all sizes.

On the markets there were numerous quantities of good stock offered and trade there appears to have been satisfactory, a condition which favorable weather undoubtedly had much to do with. There was no frost and no wind to destroy stock, and while the day was cloudy, only a very little rain fell for a short time in the afternoon and then just enough to lay all the dust. It is very possible on the whole that there may be no great increase over the best previous year in most instances, but the probability is that total sales have not often been exceeded heretofore. NEMO.

PITTSBURG.

Easter trade surpassed all expectations. The prospects Saturday morning were not encouraging, a drizzly rain set in and continued at intervals all day. In spite of the inclemency of the weather, business keeps up very brisk. The amount of business done will exceed that of last year by a good percentage.

The usual Easter display, which was opened Easter Sunday at the Phipps Conservatory at Schenley Park, is the finest Pittsburg has ever seen. It is estimated that fifty thousand people viewed the exhibit last Sunday.

The flower exhibit at the Allegheny Conservatories far surpasses the Easter openings of former years and the handsome collection was much admired by many thousands. T. P. L.

HARTFORD, CONN. — One of the greenhouses of Alfred Whiting was partially destroyed by fire April 3. The loss is estimated at $1,500.

Extra select stock at Kennicott Bros. Co., Chicago. All flowers in season at lowest market rates.

WE HAVE PLEASURE IN OFFERING TO THE TRADE THIS SEASON FOR THE FIRST TIME ONE OF

The Finest Novelties in Chrysanthemums

—EVER SENT OUT—

...MRS. O. P. BASSETT...

It will only be necessary for us to state that **This is a Yellow Mrs. Henry Robinson** to ensure for it a large sale. It is a sport from Mrs. Henry Robinson, with which variety it is identical in every respect except color, being a delicate primrose yellow, deepening toward the center of the flower. It has been thoroughly tested, and is a novelty of sterling merit. One of the most eminent eastern growers who has tested it states that it is one of the best things in Chrysanthemums sent out in some time. Every Chrysanthemum grower will want it. **A Yellow Mrs. Henry Robinson** will be a money-maker, and a fine exhibition variety as well. Plants now ready for delivery. We have also fine stocks of the other finer introductions of the year—**FRANK HARDY, MRS. H. WEEKS, AUSTRALIAN GOLD.**

Price, $3.00 per dozen; $20.00 per 100.

Wm. H. Chadwick, $6 per doz. The Yellow Fellow, $3 per doz. Pennsylvania, Autumn Glory, Solar Queen, Black Hawk, Quito, Thornden, $5 per doz.; $35 per 100. Boundless Snow, Mrs. C. H. Peirce, Miss Gladys Vanderbilt, $3.50 per doz.; $25 per 100.

We offer also all the best of the **Novelties for 1897,** and the **Best Standard Sorts.** Send for our wholesale list and large descriptive catalogue, giving full list of varieties and prices. We have a very large and fine lot of Novelties in Cannas for 1898, also best and latest introductions in Carnations, Dahlias, Strong Field-grown Roses and other Hardy Plants, a large and fine collection of Palms and other Decorative Plants, etc., etc.

We will be pleased to send our wholesale list and descriptive catalogue to any one who may not have received them.

LOUISVILLE, KY.

Ky. Society of Florists.

The Kentucky Society of Florists held their regular monthly meeting at the store of Mr. Fred Haupt, at which it was decided to hold a fall show next November. Messrs. Jacob Schulz, W. Mann and Jos. Coenen were appointed a committee to prepare rules and premium list. A meeting will be held April 14 at the establishment of Jos. Coenen & Co. to adopt rules and premium list. After the meeting, refreshments will be served.

Notes.

Heavy frost and snow on the 5th and 6th inst. killed all of the peaches and most of the plums and pears. Business is inclined to be dull, but with an upward tendency with the approach of Easter. Lilies and carnations are very scarce.

The writer recently paid a visit to the establishment of G. Thompson & Sons. This firm has been in business since 1872, and have at present twenty houses stocked with a large variety of plants, which were in fine condition. One house of cinerarias in 6-inch pots was grand—immense blooms, and in such variety of colors! The business is at present looked after by George Thompson, Jr., Mr. Thompson, Sr., having retired after a well-earned rest. His brother John was appointed Superintendent of Parks last fall, and is out of the business at present. They contemplate rebuilding several of the houses on a more modern plan this summer. KY.

SPRINGFIELD, MASS.—The Easter trade was very satisfactory all around, and several florists report the best trade in their business experience. A novelty was Crimson Rambler roses in 8-inch pots, two to three feet high, and loaded with bloom. Carnations were off crop and in consequence were scarce and high priced.

TERRE HAUTE, IND.—Easter trade was about 25 per cent. larger than last year, the sales of plants being especially large. Not so many large orders as formerly, but large number of small ones.

ELGIN, ILL.—E. H. Ricker has obtained an injunction against the Ricker National Nursery Co. restraining it from making any moves whatever. W. H. McGregor has been appointed receiver of the nurseries. A suit for the dissolution of the partnership has also been begun.

SPRINGFIELD, ILL.—The governor has named April 22 as Arbor day for Illinois this year.

THE LILY DISEASE.

The press of Bermuda is endeavoring to awaken the lily growers there to the fact that the bulb-growing industry of Bermuda is threatened with extinction, and the board of agriculture of the islands has published suggestions to growers that, if followed, will do much to mitigate the disease. The Bermuda Colonist of March 12 prints a long editorial on the subject and makes its warning very emphatic. It quotes from a recent issue of The Review a report of the aggravating conditions American growers of bulbs have had to meet, and sets forth in most convincing terms the fact that such conditions will cut seriously the sale of bulbs.

Improved Sectional Heater.... For Water or Steam

Below will be found a few of the points claimed for this boiler:

Simplicity of Construction. No joints inside the boiler.
Sectional Headers to correspond to each section of boiler.
Sectional Ash Pit to correspond to each section of boiler.
Maximum amount of vertical circulation of water.
Minimum amount of friction.

The heating surfaces in firebox are so arranged that the hot gases must strike every part before entering combustion chamber.
Direct or Indirect Draft, as conditions may require.
Smoke Box can be placed on front or back of boiler.
Maximum amount of heating surface exposed to the direct action of the fire in a given space.

FLORISTS' REVIEW

COPYRIGHT, 1898, BY
FLORISTS' PUBLISHING CO., 520-535 Caxton Building, CHICAGO.

Vol. 1. CHICAGO AND NEW YORK, APRIL 21, 1898. No. 21.

HEUCHERA SANGUINEA AND ITS VARIOUS USES.

This is one of our most useful hardy perennials in the whole list. It is a constant and profuse bloomer from spring until fall, is equally well suited for the borders or the front of shrubbery, and will make a delightful show when planted in a bed by itself, where even in midwinter it is not without attraction, because the evergreen foliage assumes then a variety of bright and bronzy tints and colors, which are so acceptable during the dreary winter months when our flower beds generally are devoid of all cheering features. If we can not have brilliant flowers at this time, let us endeavor at least to provide for the missing color by the free introduction of just such things as this heuchera.

A corner in the store of Mr. E. Wienhoeber, Chicago, at Easter.

Although a comparatively new plant it has found its way rapidly into all collections, and is not a rare plant now; its merits were recognized quickly among all lovers of hardy plants, but as yet few of our florists have paid much attention to the subject of using it, either as a bedding plant or for cut flower purposes, for both of which it is admirably adapted. A native of Mexico, but hardy as an oak tree with us, no protection is required in the severest winters (we have grown it for twelve years). The foliage is roundish cordate, with serrated lobes, slightly pubescent, especially along the leaf stalks, which latter spring from the low, stout crown tops in closely crowded circles, the leaves forming a compact mass about eight inches in height. From the axils an uninterrupted succession of paniculate flower stems are produced all summer, 15 to 24 inches in length, which are loosely set with charming little deep coral red flowers, bell-shaped and very graceful in appearance. These flowers last for a long time in water and are admirably adapted for narrow, tall little vases, and may be used to advantage in any instance where a light and graceful effect is to be produced. They are not bulky flowers, which would make a grand show in large decorations, but are dainty, beautiful and attractive when used in the right place.

We can have them at any time in summer or in fall, and by taking up a few plants in autumn and placing them under glass, we may have them also in winter. For this purpose we may either use the undivided clumps or single crowns, but in the latter case we must start operations earlier, because good spikes can not be expected from imperfectly established plants; therefore the crowns should be potted singly in three or four inch pots in September, and set in a convenient place where every encouragement for root formation must be given so that we may have well rooted plants any time when we get ready to take them in. A side bench, in which chrysanthemums were grown, may be used. The temperature of a carnation house suits them well, but a little more heat does not hurt; still when

grown too warm the stems get weak and flowers are pale. If it should be desirable for some reason to keep the plants in pots, repotting and an occasional feeding must not be neglected; otherwise there will be no trouble in their successful cultivation; ordinary common sense treatment is all they require.

In spring the old plants can be planted out again, and will in a short time bloom as freely as those left in the border all winter. Well established single crowns are perhaps preferable to the clumps. We get better and larger spikes from these and can plant them closer in the bench, but good results are also obtained from carefully lifted old plants if their roots are not mutilated in the operation. For spring sales it makes a good salable pot plant, and we have found that there is a ready sale for all we have to offer. We also have used some in veranda boxes for the past few years with entire satisfaction. Most people who had them once are so delighted with them that they ask us to put more of these tall red lily of the valley in their boxes another year. As to the propagation of these plants, there is no difficulty whatever; they divide freely and single crowns planted in spring will have made five or more side growths before fall. Most of these growths having roots attached to them may be again removed if stock is still to be increased.

Seed sowing is not always successful. The seedlings come up all right, but are liable to damping off in the seedpans or boxes before they are large enough to handle, yet under the right conditions and with a little precaution success may be insured. Sow the seed thinly in shallow, well drained pans filled with sandy soil; cover the seeds slightly with clean sand, keep in a shady place until all are up; then remove to an airy position and by degrees allow them more light. Always guard against overwatering and keep as cool as possible. Do not attempt to force a quick growth after the little plants are pricked off in boxes; let them alone until five or six new leaves are formed; then pot off into thumb pots and in a few days after they will be so far established that we need have no further fear of their damping. These little plants will have to be planted out some time during summer, selecting a favorable moist or cloudy day for this performance. Some of them at least will flower in the following season, even if it be late in autumn, for their growth is rather slow at first. As to soil they are not fastidious exactly, but stiff, moisture-retaining ground should be avoided, while in very dry situations their flowering period is cut short. In a well drained, sunny position, and in moderately enriched soil, they probably do better than in shaded situations, but I have seen good free blooming plants under trees where we would not expect such gratifying results.

The plants are slow to grow in height, but after being four or five years in the same place the crowns will have elongated six or more inches above ground, which gives a neglected, straggly appearance to the plant. Dividing and deeper planting is the only remedy to rejuvenate the stock in all such cases. A more vigorous growth and larger spikes follow this change. Whenever possible this operation should be performed very early in spring, so as not to retard their free flowering too much. Fall division is not to be recommended, especially when we cannot do it early enough to allow ample time for the formation of plenty of new roots.

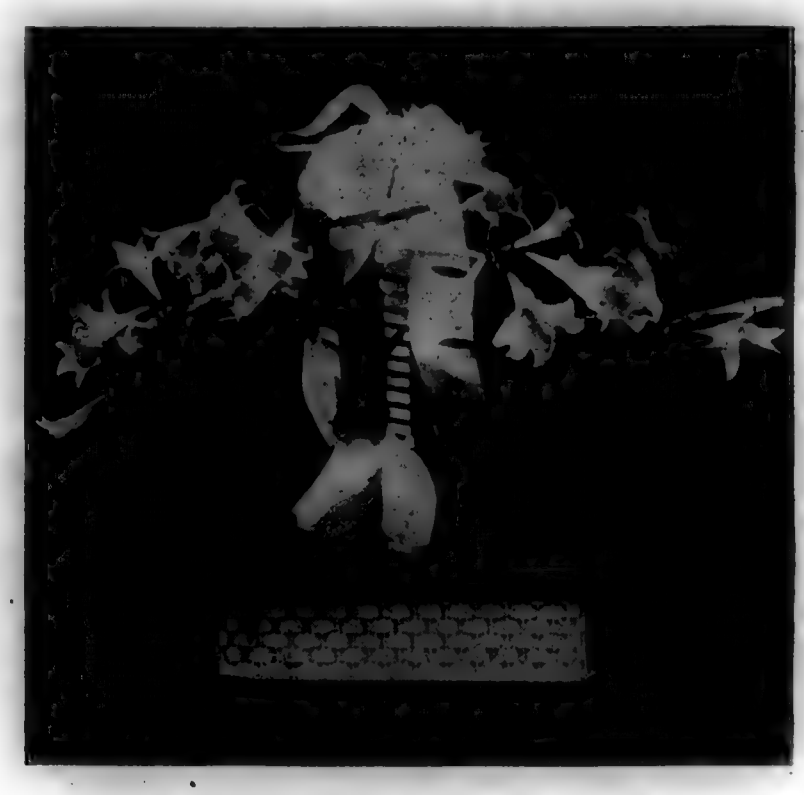
Violets in basket trimmed with blue ribbon. Arranged by Thorley, New York.

A few years ago a pure white variety was introduced, identical with the parent in every respect but in color. While we have not had it long enough to express an opinion of its merits, we have confidence in its future, but one year's favorable impression will not warrant the expression of a final judgment in this matter. The same holds good with the lately introduced H. sanguinea robusta, which may or may not be an improvement on the older variety. At the end of another season we may perhaps be able to say something more definite in connection with these plants. K.

WATER LILIES FOR FLORISTS.

Florists, to be successful in any particular branch or line of business in this competitive age, must be, to use a common expression, live, progressive and aggressive men. Prices range low, margins are small, growers holding stock ever desirous of turning the same into cash, yet reluctant to step down in prices, knowing full well that a step upward afterwards can only be hoped for, seldom if ever realized.

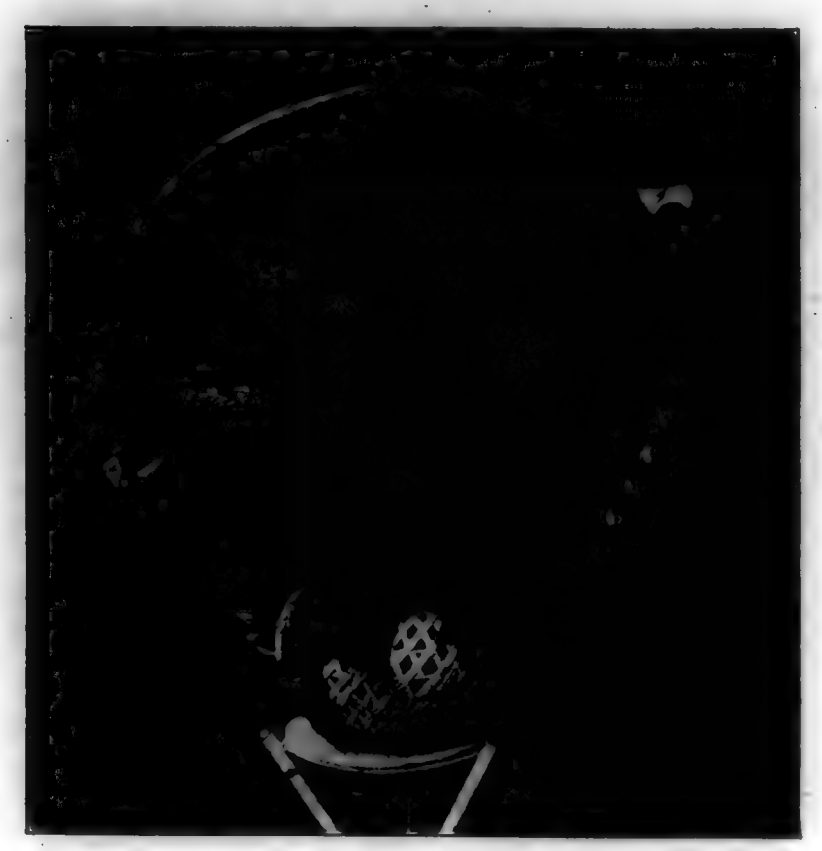
Growers of decorative plants for the garden in general should lead in the line of goods that are best adapted for embellishment of the flower garden. They should show what is best adapted for gardens and grounds of both the mechanic, the farmer or the merchant millionaire. Florists are too conservative. It is the same line of goods offered year after year, annuals, alternanthera, coleus, cannas, geraniums, etc., with a few novelties, occasionally new varieties or names, but no radical change or departure from the style of "bedding." There are some indications of a change, but in many places scarcely perceptible, far from becoming general, but a change there will be, and a welcome one it will be when time is fully ripe, and the florist who is alive to the fact will benefit by it.



There is in some sections a very noticeable increased demand for hardy perennial plants. These are destined to become the most popular flowers for the masses of flower loving people who can grow flowers, and among them are classed hardy water-lilies and other aquatic plants, sub-aquatics and such as delight in a moist soil. The florists' garden should be a model one and should advertise his stock as much as do the windows of a dry goods or milliner's store.

Aquatics are ever increasing in popularity, yet it is surprising to find numbers of persons who have never seen a colored water-lily or know what a night blooming water-lily is. Florists should be alive to the fact that these are popular plants, the coming plants of the future, and there is money in it if handled judiciously, either as plants or cut flowers, and will lead to sales of other stock. A few well grown plants are a great attraction, and will certainly pay well for the investment.

To commence with, a good plan is to have a small artificial pond, about ten or twelve feet in diameter; this will suffice for three or four water-lilies and some lotus, with a few minor plants. The shape may be circular, oval, oblong, or whatever may suggest itself to the grower, according to location and other circumstances. A background of flowering shrubs, ornamental grasses and hardy perennial plants make a good setting to the pond, where, if the latter is artificial, all traces of masonry should be obliterated. The depth of water to grow most water-lilies in is an average of twelve inches. A pond may be made two feet deep. This will give ample



Hydrangea trimmed with crepe paper.

By Rosary Co., New York.

accommodation for the plants, either grown in tubs or boxes or soil placed in the bottom to the depth of ten or twelve inches, and twelve inches depth of water above the crowns of the plants. In either case the soil should be covered about an inch deep with sand before filling up with water. A section of the pond should be walled off in which to grow the lotus, as they are rampant growers and should not be confined to the limits of a tub as nymphaeas. Plants of both nymphaeas and nelumbiums will do moderately well in tubs plunged in the ground or standing on the surface, but they do not compare well with those that are submerged in a tank or pond where the water surface affords a much better and larger development of leaves, and consequently flowers.

A pond ten feet in diameter will afford accommodation for four plants of nymphaeas, either planted out or grown in tubs or boxes. These may be all hardy varieties, but as the hardy varieties do not embrace all the colors some tender varieties may be included, and the four plants may each be a separate color, namely, red, white, blue and yellow. With two exceptions, no class of plants embrace these four distinct colors. Nelumbiums are supplied in three colors in various shades—no blue.

The soil for nymphaeas and aquatics generally should be fibrous loam, inclined to be heavy, two-thirds, and thoroughly rotten cow manure, one-third. Plants to furnish a pond ten to twelve feet in diameter can be bought now for a mere trifle. Four

nymphaeas, as before stated, and two nelumbiums will be sufficient for a pond twelve feet in diameter, involving an outlay of about $2.00. These will give greater satisfaction and pleasure for the amount expended than treble the amount for any other kind of fancy bedding plants on the same space, as well as being a drawing card for the florist.

Such a pond as above described will not afford a heavy cut of flowers, but where such is needed a much larger pond will be needed. The season for planting is rapidly approaching. Hardy nymphaeas may now be planted; nelumbiums, latter end of the month or early in May, and tender varieties toward the end of May, according to sectional localities, earliness or lateness of locality. WM. TRICKER.

Riverton, N. J.

CARNATIONS

PLANTING OUT.

Indications are for an early spring, and that means a chance for an early planting out in the field. I would suggest to those who have plants in a suitable condition to plant out, and the ground in the proper condition to receive them, not to hesitate and plant. In my last notes I called attention to this matter, and dwelled especially on the importance of having the young plants in the proper condition for the transfer, ready for the first favorable opportunity to plant.

I will now say a few words concerning the preparation of the ground in the field. Of all things avoid ploughing, spading or working the soil in any way when wet. It should never be worked unless it is so dry that it will break and pulverize. It may be sufficiently damp to ball in the hand, but not so damp that it can not be broken and pulverized again to the same condition. If ground is worked when too wet, it is spoiled for the whole season, with corresponding results. On the proper condition of the soil when worked and on the thoroughness and judiciousness with which this work is done, depends much the retention of moisture in time of drouth. A liberal supply of well rotted stable manure, some wood ashes, and if the soil is deficient in lime this may be added and ploughed under. Horse manure is best for heavy soils, while cow manure is better for light soils. If bone meal or other commercial fertilizers be used, I would prefer to sprinkle them over the ploughed ground and work in with the harrow. If one possesses enough land for rotation every season, the ideal ground is some sod or clover turned under the fall before. As to the kind and texture of soil, I consider a sandy loam the best for summer culture, although carnations are grown in all kinds of soil, but different soils require different treatment, and every grower should know best how to till his particular soil. I desire to add that as it does not require a farm, and in most places not even an acre, to grow plants, it is well-spent labor to put the ground in the best possible condition.

Distance in planting differs much, subject to the mode of cultivating, either with horse or hand cultivator. Having enough land to plant far enough apart to allow cultivating with the horse, I prefer hand cultivating and use the Gem hand cultivator. We plant in rows 18 inches apart and 12 inches in the row. Every fifth row is omitted, so the field appears in beds of four rows each. In planting care should be taken not to plant too deeply, for nothing is more inviting to stem rot than deep planting. I also would caution not to plant when the ground is too wet, for it is harmful to plant and soil, as can be noticed when dry weather follows. We find the young plants imbedded in a lump of dry, baked soil, while the surrounding soil will remain comparatively moist. To break these hard lumps is equal to a replanting, for it cannot be done without injury to the plant, and if dry weather continues the plant is virtually shut off from moisture.

When transplanting much care should be taken that the young plants are well watered before planting; this especially when from pots so the little ball is well saturated with water, and when the plant is of sufficient strength and height, remove the heart, or, in other words, top it, by pulling or breaking it out. It is a great waste of strength and time to allow the young plant to form a bud, and should never be permitted. FRED DORNER.

FUMIGATING CARNATIONS.

Does smoking carnations freely injure the foliage and yellow the buds? Is there any system of fumigating with nicotine which is really practical and also harmless to the plants?

R. W. M.

Fumigating with tobacco stems will not injure the foliage or blooms when the smoke is not too strong, but it will leave the unpleasant tobacco odor on the flowers and render them nearly unsalable.

We use the Rose Leaf tobacco extract, prepared by the Louisville Spirit Cured Tobacco Co., Louisville, Ky. It can be bought in any quantity, from a pint can to a five-gallon can. Direc-

Bottle Brush (Metrosideros) trimmed with crimson ribbon in celluloid basket. By Thorley, New York.

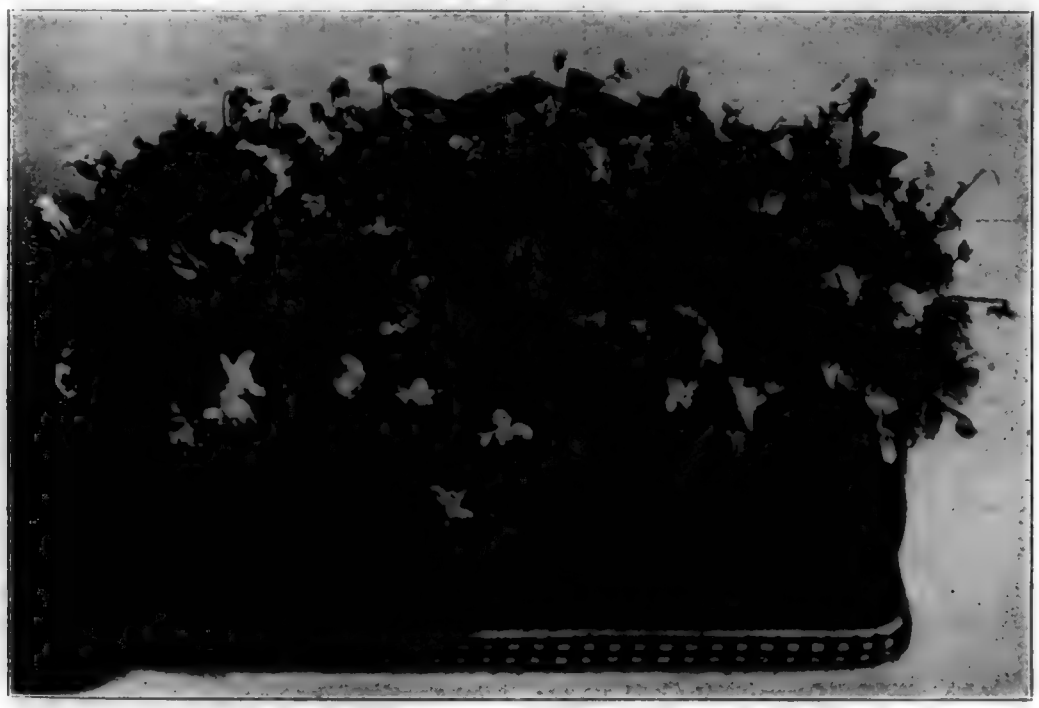
tions as to the various methods of using accompany every package. We have found this the most effective and the cheapest insecticide. It is entirely harmless to plant and bloom, but very destructive to insect life, and it will leave scarcely any odor on the flowers. This is not smoking, but a vaporizing of the nicotine, and this explains its harmlessness to the plants.

FRED DORNER.

CARNATIONS NOT OPENING.

I send some samples of Scott carnation which you will notice are affected by what seems to be a fungoid growth that prevents the flowers from opening. Albertini, Jubilee, Armazindy and Daybreak are growing in the same house, but have never shown any signs of the trouble affecting Scott. About two weeks ago I first noticed that the flowers did not open and for the last ten days I have not seen a perfect flower on Scott. All other varieties are doing finely, and so did Scott up to two weeks ago.

The temperature is 50 to 52 degrees at night, 60 degrees on dark days and 70 to 75 degrees with sunshine. Have given plenty of fresh air and the plants have never been syringed overhead. I vaporize nikoteen occasionally and have not used any fertilizers or liquid manures for some time. Can you tell me the cause of the trouble?



R. W.

The flowers received do not show any fungoid growth, and I think the trouble must be due to other causes. When a bench becomes dry at the bottom and this remains unnoticed, especially during several bright, warm days, the trouble described may result. The buds that are just showing color are more apt to be affected than the open or half open blooms. It will occur only when exposed to the bright sunshine. R. W. says that other varieties growing in the same house are unaffected, but varieties differ, and especially in the absorption of moisture from the soil. The water supplied to the whole house alike may have been sufficient for the other varieties, but not for the Scotts, and the latter have become dry at the bottom without being noticed, which made them unable to withstand the effect of a sudden burst of sunshine at this time of the year. This is a reminder to at once put on a light shading, which is really necessary at this season to preserve the flowers and prevent their dwindling in size. The best shading is white lead and kerosine, mixed very thin. Put it on with a good whitewash brush, over the whole glass and not in streaks, but apply it as thin as possible. It will break the sun's rays, but will not wholly obstruct them. The glass will have the appearance of being milky. This wash is more expensive than the lime wash, but it will last longer and answers the purpose much better, by being and keeping more transparent.

FRED DORNER.

Violets, Erica Fragrans and Adiantum in hamper, with lace ribbon. By Thorley, New York.

Marie Louise Violets and Small Ferns in fancy basket. By J. H. Small & Sons, New York.

VIOLET NOTES.

Another Easter has come and gone, and like last year with us the demand for violets was greater than the supply. Unlike previous years, the last two years have seen the poorest trade directly after the holidays, remaining so for a week or two, then commencing to pick up, and growing better till Easter, which practically closes the season. Of course, if you have taken proper care, in shading, ventilating, etc. (as previously mentioned), you will still be picking fair violets, which meet with ready sale at the reduced prices at which they can be sold for the balance of the season.

The preparation of your field for growing next year's stock of plants should now have attention. If we can have just what we prefer, we like to take a piece of sod land, a good stiff sod, covered thickly with well rotted manure (the well rotted part I would emphasize well), free from sticks, straw, stalks, etc. Then we want a man that knows how to plow with a good team and plow, so that the sod and manure are turned under entirely and smoothly. But if we cannot have this, we prefer a field where a sod was turned under last season, and which received good cultivation, and is free from stubble, manuring this and proceeding as with the other. We do not like to use horse manure if we can get other kinds, unless it is two or three years old, or the land is inclined to be cold and damp; then it is well enough, unless the season is extremely dry.

I should also say that we have found it important, if possible, to have the field so located that it can be watered if a continued dry spell oc-

curs. This is the more necessary when we have a season like last year, which was wet till late, when the dry spell came on. We had one piece that we made no attempt to water, as it lay rather more moist than the others, and owing to the rains nearly all summer and the nice appearance of the plants we did not realize in time that we should have watered them. Had they grown dry all summer they would not have suffered so quickly, but having grown freely all season, they were softer than they otherwise would have been, and so felt the change more quickly. The result was it hardened them up quickly, giving them a severe check, from which they took a long time to recover, and part of them received a good dose of red spider as a consequence of the check.

The moral of all this is that when you think your stock is the best is the time the violet growers' motto, "eternal vigilance," is perhaps most imperative. Certainly we shall cause rain of our own to fall on our violets this season if nature fails us, if only for a short time. R. E. SHUPHELT.

Heath and Epacris in fancy basket and silver jardinieres. By Stumpp, New York.

RECOLLECTIONS OF EASTER.

The Easter of '98 will long be remembered by the florist, not only for the perfect weather which prevailed, but as a considerable advance on any previous year in the general use of our and nature's products. Fifteen years ago the florists in large cities, or, for that matter, any city or community, looked forward to church orders as the coveted part of the business. Not only the order from the church, but many elaborate designs as memorials were sent by members of the congregation, and these decorations were largely confined to one or two denominations. Beautiful as all this was, there has been a great change; it has become our greatest season of all the year. The day is one of gladness to all classes. Apart from its sacred associations, Easter is the awakening from the sleep of winter to the life and animation of spring. Kindly greetings and an exchange of some remembrance are now becoming almost universal, at least in our land, and who is more the beneficiary of this Christian custom than the florist? Many another business gets an impetus at this season, but none relatively more than our innocent calling.

It has increased from year to year, and never were there as many plants and flowers sold as the Easter just past. Fashions come and go, and come again. The Easter card had its day, but it is hard to believe that such an appropriate, guileless gift as a pretty plant or bunch of flowers can ever drop from popular favor. As previously mentioned, I believe all florists will agree with me that we dispose of more of our products at Easter than on any one day or week of the whole year. Long may it be so and ever increase, and may we all be deserving of the kind patronage of generous people.

He is a dull man who does not profit by the experiences of the past; and what are they? To the writer, some of them are as follows: The public, our patrons, expect, and reasonably, too, that every plant delivered to a friend should be neat, tasty and, however inexpensive, at least attractive. The days of dirty flower pots are some time past, and now the days of the bare pots are past. I am not an advocate of the florists' stores being ribbon counters, but the naked earthenware pot is not the thing to accompany the beautiful plant. If our patrons wish to pay for several dollars' worth of ribbon to adorn a lilac, let them have it; they will pay for it. Usually those most willing to indulge in the abnormal are more able to pay. The crepe paper as a covering for the plebeian flower pot was very generally used, and even for the inexpensive 25-cent hyacinth it greatly enhanced their appearance in the eyes of those who were receivers. This is a tax additional to former expenses, but the increased business and an improved way of conducting it will easily pay these little charges.

It will largely depend on your taste, your promptness, your general neatness and the all 'round condition in which a plant arrives at its destination.

About your future orders: To digress one moment—a clever and good gardener may have watched over a plant for months, studied temperature, parasites, and care in every way, and when his pets had reached perfection and he had realized a good price for them, they were ruined by some careless delivering of an ignoramus. The man who sees that the orders are carefully packed and started right on their destination is quite as valuable as the man who sells them.

The most important impression I received this past Easter was that an exchange of gifts is getting now to be so general that, even with the wealthy, unless they can "remember" all their friends with a plant or box of flowers at a moderate cost "per head," they will slowly discontinue this most amiable practice. Among the very wealthy a big price is often paid for a large and handsome plant, but it is so rare that the general florist need care little if he has to disappoint his customer in this respect. He cannot supply everything, even if he kept a department store.

While not in the least discouraging is the importation of plants from Europe that we can properly use, yet undoubtedly too much dependence is placed on these plants, and not near enough to acceptable, moderate-sized plants that can be easily produced at home, and are much better relished by our patrons, especially those whose pockets are not bursting and who always will be in the majority.

Take notice that azaleas had but a very moderate sale and lilacs and several other of these bulky plants went slowly. I have no wish to lower the business, but it is a fact that the plant that sold from 50 cents to $2 had the call, and the dollar plant was certainly the favorite, even with the well-to-do. The lily held its own, even a stronger favorite than last year, and there is not the slightest reason why it should not remain the emblematic flower of Easter. Grow more yourself and depend less on costly importations. I have in mind several things

Boronia Elatior trimmed with pink and white ribbon, in celluloid basket.
By Stumpp, New York.

that sold so well this year that I shall grow them in much increased numbers for another year, and if I know how, the readers of The Review shall know as much as I do.

WILLIAM SCOTT.

MISCELLANEOUS SEASONABLE HINTS.

Poinsettias.

If you have not already started your poinsettias, do so at once. It is not late, however, for cuttings struck months after this will make most acceptable plants. Our old plants have been stored away just as they were knocked out of the pots and placed in flats, in dry soil, under a dry, warm bench. The wood will now be ripe and hard. Shake off the old soil, cut back the stems to the sound part; usually an inch or so is dried up; pot into 4-inch pots, and start them growing in a light, warm house. You will get plenty of breaks, which, when 2 or 3 inches long, make the best of cuttings. They root easily in an ordinary cutting bed, but should neither in the sand nor the first week or two after potting be allowed to wilt for want of water or shading. But remember that after the young plants are once well rooted in the pots, not a particle of shade at any time should be given.

It may be entirely immaterial about cutting many cuttings at or just below a joint. In the poinsettia I much prefer the cut should be close to a joint, and when taking the cutting from the old stem, leave at least one joint of the young growth, from which you will get another crop of cuttings. Those propagated as late as August made last winter our best plants, for the earliest propagated were spoilt by mismanagement, while the plant, after flowering, can be treated almost like a dry bulb; it is very different when in full leaf, and in the successive shiftings that you give it the roots must be disturbed as little as possible.

Lilies.

Since the great clear-out of Easter, we have to shift and spread out many of our future crops. The lancifolium lilies should now be shifted from the 4-inch pots in which they were started to a 5 or 6-inch, their flowering pot. A cool, airy house suits them best, and a little shade, and if kept free of aphis by regular fumigating, will well repay the room and labor, especially Lilium l. album. They make a handsome bunch, and we have them in July and August, when white flowers are scarce.

Smilax.

The flats that were sown in January or February should now be potted off into 2-inch pots. They will do in any shady corner, and I have seen the little plants thriving beneath a bench, but the better place you give them the stronger and better they will be. About June 1, those for your own use, at any rate, should be shifted into a 3-inch; then they will be stout plants to plant in the new bed very early in July. The difference in results between a spindling little plant and a stout one in a 3-inch would be one crop worth at least 15 cents per string. A strong plant set out in July will easily produce four crops by the following June, if grown in a temperature of not less than 60 degrees at night.

Geraniums.

In February we took off the tops of a good many thousand zonal geraniums and put them at once into 2-inch pots. A very small loss has occurred, and they make better plants than those put in the sand. Just as soon as well rooted, they should be shifted into a 3, or, better still, 3½-inch pots. They make fine bedding plants and come in finely after your 4-inch autumn struck plants are disposed of. Why I mention these simple operations is that several seasons we have been guilty of leaving these spring-struck geraniums starving till the middle of May, and then shifted them. They would then almost stand still. They were stunted, and you had ceased firing, and when you do that, there is a halt for a short time in the growth of all the soft wooded plants.

Pelargoniums.

We have rather a large and fine lot of these showy plants. I may be allowed to say this, as they are not for sale except at home. They are broad and stout, with leaves like small rhubarb. You cannot see the pots, which are 5-inch, and the buds are just showing color. Cool and almost dormant as these plants have been in the days of winter, in spring they begin to grow, and when flowering must have plenty of room and abundance of fresh air, and in damp, rainy weather, during the months of April and May, must never be without fire heat. When in full bloom, one cool, damp night will ruin them, and their petals will drop, rotting the leaves in a few hours, and your work of months is ruined in one night. Greenfly is very fond of them, so smoke often till the flowers are open, then mildly, or the flowers will drop. It's a pity the pelargonium is not more popular and profitable. The wonderful flowers and more durable qualities of the zonal type have taken its place, but it is a real good window plant.

Cannas and Caladiums.

You should not lose a day, now, in getting all of these into 4 and 5-inch pots. Much room has been saved for the past two months by having these in flats, crowded together and growing in some light, rich soil. We are tearing them apart and putting the strongest cannas in 5-inch and others in 4-inch pots. The caladiums must have at least a 5-inch, for they are great to root. There is an annual increase in taste for bold or sub-tropical gardening, in which cannas take a leading part, and you are not likely to be overstocked with them. Remember that coarse as the caladium is, it is truly tropical, and will not grow unless kept warm. The canna will grow moderately in a lower temperature. Papa canna is a grand variety and no longer expensive; all should have it.

Chrysanthemums.

You should endeavor to put in a large batch of cuttings just now. With the help of fire heat, and daily watering of the sand they will root very quickly. Cuttings rooted now will make just the plants to put on the bench the middle of June to make your plants for lifting in September for pots, but what is of more consequence they will, if kept growing, be fine plants to put on the benches at the end of June for your main crop of flowers. If you have a nice lot of Bonnaffon or Jerome Jones propagated two months ago, as they should have been, and they are growing strong, don't pinch them, because the tops would make "such nice cuttings." Let them grow, and even if you have to put them into 4-inch pots for a month, it will pay you over again. You should manage to get the two varieties mentioned, also Ivory and Mme. Bergman, planted by the middle of May, if you expect or want to get A1 flowers, with good stems. Young chrysanthemums that are in 3-inch pots will do very well in a cold frame, far better than in a close, stuffy house.

Asparagus Plumosus and Sprengerii.

Several weeks ago I advised the sowing of both of these. Sprengerii is one of the most useful plants we have; its beautiful fronds or branches are going to considerably affect the demand for Maiden Hair ferns; then again, it is so durable and adapts itself to a bench, a pot, or a hanging basket. Plumosus has proved this winter with us of the greatest value as a plant for fern dishes. So well is it adapted for that purpose and so satisfactory to the purchaser, that we have been frequently asked of late to refill a fern dish with a Cocos Weddeliana and nothing else but A. plumosus. They are bushy little plants, sown last July, but to have them of useful size in November they should be sown not later than this date. If one-third of your stock of small plants for ferneries is composed of Asparagus plumosus nana, you will be fortunate. Where the nana comes in I don't see, as it would grow thirty feet high, if allowed, and does in the lofty houses of Mr. Wm. Elliott.

The Use of Hot Beds.

Some readers may think it's rather late to talk about hotbeds, but it's not. It would be to start growing cucumbers or lettuce, but for the next five or six weeks it's just the place to induce a healthy, free growth on many plants; it is the genial warmth that the roots get when plunged, or the ammonia in the atmosphere — most likely both. Certain it is that many plants will grow with more freedom and vigor than it is possible to obtain in any greenhouse with the greatest care.

Here is a list of what we are just now plunging in three or four inches of soil on top of eighteen inches of stable manure, evenly and firmly made: Tuberous rooted begonias, that were started in flats about five weeks ago; just the place to prepare them for bedding out at end of May; some tuberoses that were also started in flats several weeks ago, and which you will be asked for at bedding-out time; the variegated and bronze geraniums; alternantheras of all kinds, the only place for them; mignonette, three little plants in a 3-inch pot; they are always wanted; lemon verbena, sweet alyssum (of course, only the double), verbenas, rose geraniums, ageratum, and others.

I don't approve of putting the zonal geraniums in a hotbed; they make such a rank growth that although attractive enough to your confiding patron, are very liable to stand still when bedded out later on, and that would redound to your discredit. These homely structures are not only a help to the plants, but give you much more bench space, so scarce an article till you begin to bed out.

An Omission.

My notes last week were written under an exuberance of animal and mental spirits, produced by the charming weather of Easter, and were very incomplete. I started to say something about mignonette, but never reached it with my pen. A friend was kind enough to make very flattering mention of it in a contemporary. Certainly I have never grown anything that pleased me more, but there were only a few score of them—500 would have about filled the bill. It is a long way off preparing for them, yet they were a long while growing, and must be, to do them right. A friend remarked to me: "Seventy-five or even fifty cents was a mighty good price to get for a 4-inch pot of mignonette, but they took a long time to grow." Not any longer than we give to a geranium —from September to perhaps June 1— and then are doing well to get $12 per 100. The seed of this mignonette was sown the middle of August, and when large enough, carefully potted into 2-inch pots. In December they were shifted into 3-inch, and the middle of February into 4-inch. They were pinched several times, the last time at the last shifting. The whole secret was a low temperature. They were never out of a violet house till sold. You could grow them in half the time with more heat; tnen they would be drawn up and useless. They were about 8 inches high and 10 inches broad. The variety was obtained from John N. May some years ago, and good spikes selected for seed every season. I still think it is a grand variety, and bids "defiance" to them all.

WILLIAM SCOTT.

BALTIMORE.

Easter Report.

Taken as a whole, Easter trade was very satisfactory. A few days of sunshine and mild weather had the happy effect of opening stuff up and restoring lost color and vigor, thus making the local supply more plentiful and of better quality than expected. This favorable change came too late, however, to entirely satisfy the demand, and as our market was taxed to its utmost, Washington, Philadelphia and even New York received and responded to a good percentage of our orders.

The retailers all did as much business as they could conveniently handle. Every one has reported "as much, if not an increase over last year's sales."

A glance at the store and window decorations confirms the fact that they never have been more tastily decorated than at this season. The storekeepers seem to have tried to outrival each other in this particular.

Crimson Rambler was the talk of the town and sold well at novelty prices, while laurels, ericas, acacias, genistas, scores of azaleas, lilies and the common blooming stuff in general were as much in demand as ever. Fancy dresses of crepe paper, ribbon, etc., added much to the attractiveness of these plants, and in many cases helped to sell them.

Brunners, Jacks and Meteors were the red roses. Beauties, being somewhat poor, were not sought after. Carnations were the favorite flowers, and many thousands were disposed of at $1.00 and $1.50 per dozen. Violets were miserably poor. Many of our retailers refused to take orders or even to handle any, while those that did are now wishing they had not touched them. The chief complaint was that they did not keep twelve hours after picking before turning to water, and were too rank for use.

The markets on Easter Saturday evening presented a sight which is seldom seen outside the domains of a flower show. Most of the stall holders augmented their supply of stock by double the usual amount. This, however, proved a well taken precaution, as the streets were unusually crowded

and an immense business was done. This week at the markets bedding stuff, such as geraniums, coleus, etc., has taken prestige over bulbous stuff, and trade has again settled down to the usual run.

Notes.

At the last regular meeting of the Gardeners' Club, April 1, our financial secretary, Mr. Wm. Paul Binder, tendered his resignation, owing to press of private business.

We have just passed a week of weddings. Several large events are now booked for the later part of the month.

C. F. F.

NEW YORK.

The Wholesale District.

The usual toboggan of prices after a holiday, and the relapse of the market into "innocuous desuetude," is no exception at this writing; the aftermath, so to speak, has simply been sickening—the worst in the remembrance of the "oldest inhabitant," and that is saying heaps. The possibility of war has been no mean factor in this, either. As usual, the luxuries suffer first.

American Beauties, which seem to have been an endless chain of late, are still coming in in abnormal quantities, and range in value from 10 cents to 20 cents each, more being sold at the former figure, 12½ cents being a good average for really fancy stock.

Brides, Maids, Morgans, Cusins, Meteors, etc., there are in plenty, and range in price from $5 to $50 per 1,000. The quality of the roses leaves no room for complaint. Brunners are very fine and command fair prices. There is a considerable shortening in Jacques, however, but the price is low.

Carnations are not so plentiful, and are about the most salable stock; in fact, they will show an excellent average for the season. There are times, however, even when this stock goes begging.

All the Harrisii "that didn't quite get in for Easter" is now flooding the market, and prices are almost what you can get. This applies a good deal also to all bulbous stock.

As to violets, the less said about them the better, prices running all the way from $1.50 to $4 per 1,000, and practically no demand. Since every Tom, Dick and Harry has taken to wearing them, the "four hundred" have almost ceased to buy.

Sweet peas are getting quite plentiful, while orchids and smilax are getting scarcer daily, though it is almost time the new crop of the latter was coming in.

Seed and Bulb Trade.

All the seedsmen report a heavy increase in business, 20 to 30 per cent in some instances. There has been plenty of life to the trade and indications are that it will be way ahead of last year. This is indeed good news, as this department has suffered greatly the last three or four years. Prices, however, have averaged low. The backbone of the mailing and shipping is broken, however, now, and the "counter" trade is almost at its height. The recent cold snap checked this considerably, and so it has come now all of a rush.

The spring bulb trade, too, has been very satisfactory, Japan goods selling remarkably well. Many are booking heavy orders for fall bulbs, and the men on the road are making a very satisfactory showing.

Retail Trade.

Recent interviews with the above confirm my statement of last week that plant sales at Easter were enormous, with very little stock left over.

As usual, after Lent, there is a general revival all along the line, though not so marked as in former years. There are many weddings and social functions, however, that are happening, and the future is bright if that word bugaboo war did not stare us in the face.

Various Items.

Lost!!!—The firm of Polykranas & Slavropoulis, of Columbus avenue. There are many wholesale men and plant growers who would like to know their present address. It seems they have left for parts unknown, leaving many bills unpaid.

There are many instances in history, fiction and prose of patriots leaving their trades and going to war. Who shall be the first Cincinnatus to start for the front or open a recruiting office! Victor Hugo mentions one specially, and who returned afterward "to spend his days peacefully in the art of gardening," so surely there must be some affinity.

ST. LOUIS.

Florist Club Meeting.

The regular monthly meeting of the Florist Club was not so well attended, owing to the fine weather and all the growers being too busy to leave their work. This was our yearly rose meeting and quite a number of local and outside growers exhibited some fine stock.

Among the exhibitors from outside of the city were the American Rose Company, Washington, D. C., who sent Mme. Chatenay and Golden Gate. H. Weber & Son, of Oakland, Md., staged that fine pink rose, Mrs. Robert Garrett.

Among the local growers in and around St. Louis were J. F. Ammann, Edwardsville, Ill.; E. W. Guy, Belleville, Ill.; F. J. Fillmore, Max Herzog and Robert F. Tesson.

The report of the chairman of the executive committee showed that the special prizes to date for the next show were as follows: Special prizes from private persons, $800; Shaw prize, $500, making a total to date of $1,300. The old committee made its final report. The special prizes still out from last year were turned over to the club and the books ordered turned over to the committee of finance for this year. The chairman of that committee is Mr. C. C. Sanders.

Rudolph Mohr, late of Omaha, made application for membership.

Report on Exhibition.

The chair then selected Messrs. E. W. Guy, J. W. Kunz and J. J. Beneke to act as judges on the roses on exhibition, making the following report: Mme. Chatenay, good color, improvement on La France and worthy of certificate; the members were much impressed with this rose.

Golden Gate did not seem to take so well, the color not being very good.

Mrs. Robert Garrett, extra good flower and excellent color. This rose has already taken the club's certificate at the last show.

The American Rose Co. also had on exhibition a fine vase of seedling carnations, some of them very good.

Mr. J. F. Ammann and E. W. Guy showed a vase each of finely grown Perles.

R. F. Tesson and J. F. Ammann, a vase each of Brides and Maids of excellent quality.

Mr. Tesson's vase of Carnots, Kaiserin, Wootton and Cusin were especially fine.

Frank Fillmore and Max Herzog each had a vase of mixed roses, consisting of Brides, Maids, Perles and Woottons, that were well grown.

The next meeting of the club will be held on Thursday, May 12, at 3 p. m. This will be an exhibition of miscellaneous flowers and all members who have a surplus should contribute and make it interesting, and should also attend the meetings more regularly. I am sure everybody can spare a few hours once a month to attend same.

A Bad Glut.

The early part of the past week is marked by the worst glut of many seasons, and with the fine warm weather we are having just now the prospect is favorable for the glut to remain over this week. The best of stock could be bought at almost any price. The fakir is having the best of it and is selling good stock on the street at any price; not only roses and carnations were selling for almost nothing, but every other flower as well.

Bulb stock is very plentiful and lots of it was sent to the dump pile. Harrisii are down to $6 and $10, and ferns are about the only scarce article in the market. Smilax is now in good demand.

Notes.

The floral decorations at the funeral of Adolphus Busch, Jr., son of the millionaire brewer, were large and elaborate, and every florist in town had one or more designs. The rush for white flowers Saturday and Sunday was great and was considerable relief to

the commission men, as they were stocked up to the brim with flowers of all kinds. The Riessen Floral Co. had the bulk of the trade, having to work all night Saturday. They counted 100 designs of all descriptions. Jordan Floral Co., Aug. Schuerman, C. Young & Sons and North Floral Co. were also very busy.

The attendance was somewhat better at the Bowling Club Monday night, and some of the old faces showed up once again. The usual three games were rolled and some good scores were made. Beneke was high man, with 572; Kunz second, with 558; John Young third, with 549. The high single score was by Beneke, with 224; Kunz second, with 214; Kuehn third, with 200. Mr. Duncan Finlayson was a visitor and rolled with the boys. Next Monday night will end the April series and the race for the average medal is between Kuehn, Beneke and Kunz. Anyone who wishes to win the high score medal will have to beat 266, by Emil Schray. J. J. B.

CO-OPERATION.

If you are in the trade and are not yet a subscriber to The Florists' Review, send in your name and one dollar now and you will receive not only The Florists' Review for one year, but also a certificate entitling you to the earnings on one dollar's worth of stock in the Florists' Publishing Co.

Why do we make such an unparalleled offer? It is very simple.

You will have an interest in the success of the paper.

You will see that you can buy everything that you want to just as good advantage from advertisers in the Florists' Review as elsewhere, and at the same time benefit yourself by increasing the earning power of your certificate.

This mutual arrangement cannot fail to bring to the paper a heavy advertising patronage, and as a result the stock represented by your certificate will earn good dividends.

And the more you buy of advertisers in the Florists' Review (always mentioning the paper) the larger your dividends will be.

You get the best paper in the field and a share of its earnings.

Send in your subscription now. Address the Florists' Publishing Co., 520-535 Caxton building, Chicago, Ill.

NOW in course of preparation, The Florists' Manual, by William Scott. It will cover the whole field of commercial floriculture, the articles arranged alphabetically, so that reference may be quick and easy. It will be a whole library in itself. Price only $5.00. Send in your order now to the Florists' Publishing Co., 530-535 Caxton building, Chicago.

TORONTO.

Satisfactory Easter.

Not having returned home until the Tuesday after Easter, I am unable to give particulars of the Easter trade here, but, judging by the beaming countenances of those whom I have met, I should say that it had been above the average. Times are certainly improving all over Canada; we are on the up grade again, and though the grade may be light, still it is up, and people feel that it is safe to loosen their purse-strings a little. It is sincerely to be hoped that we shall have no more booms, to be followed by their inevitable consequences.

Personals.

The jovial, genial and well beloved gardener, Joseph Graham, late of the Asylum, has been moved to the Government House, and will for the future preside over the gardens and greenhouses there. I don't quite know, but I have an idea that "Joe" will not altogether appreciate the change, although the salary is larger, and it is decidedly a step-up, but having been at the Asylum for so many years and having made so many improvements, both in the gardens and greenhouses, he had become a part of the institution. He had collected a very large number of plants, too, and took great pride in them. If anybody had lost or wanted some particular variety of anything, "Joe" was sure to have it, and was always willing to give or trade cuttings. Every one will wish him luck in his new sphere.

Fred Brown, who succeeded Mr. Arnold in his store on Queen street, appears to be doing very well, and is more than keeping up the reputation of the stand.

A Visit to Vancouver.

Floriculture in Vancouver, B. C., is very little behind the times. It is a difficult climate in which to grow flowers during the winter months, there being so much dull, wet weather. Carnations and roses were being grown on the bench, but, it seemed to me, not with any great success, the difficulty being to get the bloom on when it was most wanted. Roses, of course, they must have, but I think the most profitable way of growing them will be either in pots or on solid benches. I am doubtful if carnations can ever be made much of a success, any more than they can in England. There are, however, any amount of other flowers which the climate there would just suit, and I was rather surprised that other things were not being tried.

The two principal places were Messrs. Walker & Robinson and the Vancouver Floral Co. (managed by Mr. Pont, formerly of Winnipeg). Both have nice, clean, well ordered places, and appear to be doing a flourishing trade.

It was very pleasant to see again all the flowering, evergreen and coniferous trees and shrubs which any one who has lived in the old country is so familiar with; hollies, boxes, ivies, cupressus, biota, retinospora, thuja, etc., in endless variety; all the tea roses flourishing out-doors and many herbaceous plants almost unknown in these parts. The climate is about the same as it is in Devonshire, England.

As to the mountain scenery, this is hardly the place to attempt a description; it is indescribable, anyway, and must be seen to be believed. Words are entirely inadequate to express the grandeur and magnificence of it.

Now is the time to take it in, while the rates are low and you have your Easter pile in the bank.

Stanley Park, at the west end of Vancouver — 950 acres, nearly surrounded by water (tidal)—is a very beautiful place, in quite a natural state, with the exception of a road around and paths through it. The trees are principally the Douglas fir and Thuja gigantea, and they are gigantic to eastern eyes. The ferns, mosses and lichens found there in great profusion are very fine. It was here I fell in with a Mr. T. Selwood, one of the good, old-fashioned English gardeners, and many, long and very pleasant were the horticultural talks we had together. Mr. Selwood said he had not talked orchids for years and years. E.

BUFFALO.

Easter Business.

The notes I sent you last week, Mr. Editor, were taken or impressed with too much haste and excitement to be of value. Since then, time has given me an opportunity to get acquainted with the facts. It is within bounds to say that the bulk of the business must have been at least 25 per cent. more than at any previous year. I base this on the strength that there were more to do it and all pronounce an increase.

It is the verdict of all that expensive plants were not the thing this year. Moderate-priced plants sold better than Easter eggs, and very poor was

the person who did not indulge in one for friend or self.

The weather allowed plants to be handled at our public markets, and an immense quantity were there disposed of. They were, of course, a little more costly than at any of the greenhouses, but did not seem so because "we bought them on the market." If anyone disagrees with me that the business was not a substantial advance on last year, it must be simply his own experience, and that has no general result, as the world is guided by the inexorable law of "the survival of the fittest."

A few expressions from the boys will give you a better idea than any lengthy account, for it was their spontaneous expressions before they knew I was interviewing them:

W. J. Palmer, Sr.—"I tell you, it was all right, but I thought lilies were not quite so sought after."

W. J. Rebstock—"Business fine; entirely satisfied, but found large plants were wanted in small quantities."

W. Belsey—"I never had such an Easter; ran short of supply. My late cyclamens were a hit."

S. Anderson—"Plants were rather too much favorites to please me, as I was better fixed on flowers. However, it was all we could ask."

Rebstock's Annex No. 1 and Annex No. 2 (as well as some other annexes of our experience) say in unison: "What with rent, clerk hire and sundries, you are just as well without them."

W. A. Adams: "I was all right, my boy; sold out to a leaf, and that's more than most can say. Of course, it was a good Easter, but I am so tickled over getting into old man Scott's place at 479 Main street that I have no time to talk, unless you'll come across the street."

Charles Keitch—"We do not feel quite the rush of Main street, but found the demand for a pretty plant or an acceptable bunch of flowers far exceeded previous years."

Mrs. Newlands—There I could find only Mr. Wasson, Mrs. D.'s manager, who expressed himself thus: "We did first rate, you bet. Everything went clean. Say, Bill, there isn't much in azaleas. Never mind, we have an awful good lot of geraniums."

J. Pickleman—"Oh, yes, of course, Mr. S.; why shouldn't I? I had three thousand longiflorum and Harrisii all in full flower, all in good condition, and sold them well, largely on the market; fetched a good price, first-rate. Hope business will keep up." No, thanks, John; I have other people to see.

Mr. Buxton—"I never yet saw such a demand for plants and flowers, and although the great demand was for something moderate, it was more profitable to me than an expensive plant. I am much encouraged."

Thrall, the Florist—"Sacrum parentibus et amicus."

J. Stafflinger—"You bet, I was kept hustling; best time I ever had."

Henry Millatt, of dignified mien, says: "I had an elegant business and more than satisfied, yet I find, Mr. S., as you say, that costly plants are not the thing. Give me a plant for a dollar and I'll sell lots of them."

I have heard the ladies on the East Side all did a good business, as they deserve, for they are a good, sweet lot, and if I forget their names at this moment, I expect shortly to visit their establishments and thoroughly write them up.

In conclusion, I visited in the far southeastern section of our city Mr. Henry Buddenborg. He has a territory all to himself, and the population tributary to his store and greenhouses is about as large as Lancaster or Erie, Pa. Stylish as is his appearance, he is most affable in manner, and wished me to say that his sales and demand this year warranted him in adding largely to his facilities for future production. It is just as well to mention here that Mr. H. is wonderfully helped by a rosy, good-natured, clever, industrious little wife, who largely counteracts his philosophy.

Then we called in on the wholesalers, and Sebastian Pickleman, active manager of the Florists' Exchange, said: "We have handled more flowers than we supposed we would. Violets we were sadly short of, and carnations could have been sold in much larger quantities." Mr. Kasting I did not find at home, but Mr. Fred Maspholind Stokes, his factotum, said: "I had no idea this was such an event. What a business we could have done if we could have supplied all of our out-of-town orders."

Then a brief interview with Dan'l B. Long, who is now getting to be almost a patriarch among the boys, ever ready to help them and ever ready to pick up crumbs that fall from the poor florist's table. If Dan don't turn out the greatest floral artist south of the arctic zone, I miss my guess.

On my way home I called on Philip Scott, who runs 479 Main street, and asked the same question: "How was business?" "Get out of here, quick, and ask the old man," was the answer: and the old man says "Amen" to all the above and 3 per cent. added.

Various Notes.

The beautiful, unique and only hotel of its kind on this continent, "The Niagara," closed its doors this week. It is the property of Mrs. G. H. Lewis, and as a residence hotel was not paying. It will doubtless soon change hands and be reopened. It is a monument to the enterprise and almost philanthropy of the late Mr. Lewis. Overlooking Lake Erie, where she pours the waters of the great lakes into the Niagara river, its situation is simply sublime. Many of the leading florists of this country, and a few of others, will remember this majestic but quiet place of repose. The bar was in the basement.

On Sunday, the 10th, about 6:30 p. m., something, most likely spontaneous combustion, started a fire in the basement or cellar of Mr. S. Anderson's store. W. J. Palmer & Son's large store is next door. It only burnt a small hole in the floor, but terribly damaged the contents of the stores of both Messrs. Palmer and Anderson. We hear that losses on plants, flowers and fixtures have been amicably settled by the insurance companies, and if they got post-Easter prices on unsold stock, a little smoke is not an unmixed blessing.

No drummers this week, except Mott, and he has become almost a resident. W. S.

BOSTON.

Mass. Hort. Society.

At the weekly exhibition of the Mass. Hort. Society, John Mutch, gardener to J. E. Rothwell, was awarded a silver medal for Cypripedium niveum grandiflorum, a very handsome and extra large white flower of good substance. A first class certificate of merit was won by the same exhibitor for Cyp. T. W. Bond, a cross between C. Curtisii and C. hirsutissimum (a seedling sent out by Hugh Low & Co.), a flower of exquisite color and marking. J. E. Howard exhibited a fine seedling of Amaryllis vittata and was awarded a gratuity. H. A. Wheeler also received a gratuity for a finely grown and well flowered Crimson Rambler rose.

Trade Conditions.

Business is very quiet, but the calm after the storm was to be expected, and all will now have time to cast up their accounts.

Club Dinner.

Although late in the season,, the Florists' Club has decided to hold its annual dinner on May 3. The dinner will be served in Horticultural Hall. Tickets may be had from Mr. Chas. J. Dawson, the secretary.

Park Improvements.

Mr. J. A. Pettigrew, superintendent of the Boston park system, is very busy with a large force of men planting trees and shrubs and improving the old and new grounds. It is said that over 100,000 trees and shrubs will be planted this spring.

The Public Garden.

City Forester Doogue has been beautifying the Public Garden with hyacinths, tulips and narcissus that had been grown in pots. These, with the pansies and daisies, make a charming display.

A Summonsed Party.

On April 14 C. W. Hoitt, of Nashua,

N. H., entertained a select circle of friends, all more or less interested in horticulture, among whom may be noted many of the old guard of Boston and district. The invitation was in the form of a subpoena summons, and was by all reports well responded to. The Boston guests were met by their genial host and many other friends. An electric car had been chartered to convey the party to the many places of interest in the vicinity of the old township, which occupied about two hours, after which they were guided to a substantial repast, to which all did ample justice. The dining room was handsomely decorated with palms and cut flowers very effectively arranged. The summonses brought forth some able replies from many of the guests as well as several replies by letter.

New Greenhouses.

Mr. Oakes Ames, of North Easton (Carl Blomberg, gardener), is about commencing the erection of four more greenhouses, three entirely for growing orchids and one for palms. It is reported that Lord & Burnham have the contract. C. H. J.

PHILADELPHIA.

Easter Report.

Now that the smoke of battle has lifted, as writers who delight in metaphors would say, it is possible to see more clearly over the field. It seems that Easter business was better than last year; that the increase was chiefly in blooming plants; that cut flowers from out of town, especially carnations, were sent in too late on the Saturday before Easter. Many more carnations could have been profitably sold on Friday or early Saturday morning which had to be carried over until Easter Monday, because not received until the last moment. Satisfaction is general. Of course, some murmurs are heard. Mr. A. bought 'steen too many Crimson Ramblers and Mr. B. wishes he hadn't become so thoroughly convinced lilies would be scarce. But bless you, they'll come out all right in the end.

Prices fell on Easter Monday, roses about 25 per cent. and carnations 50 per cent. Last week's quotations are about as follows: Beauties, $1 to $4.50 a dozen, the quality excellent; Perles, $4; Meteors, $4 to $6; Brides and Maids, $4 to $6, a very few specials said to bring $8; Carnots, $4 to $6, a few $8 to $10; Brunners, $2 to $5 a dozen; the latter are mostly Anderson's, and while the price has remained the same as during Lent, the blooms are thought even better value for the money; carnations, $1.50 to $2, a few $3; violets are becoming rarer; valley, $3 to $4; Von Sion, $3; lilies, $8 to $10; adiantum, $1 to $1.50.

The weddings have used many flowers, but the warmer weather has so increased production that the market is heavy at times.

Plant trade is of course quiet.

Horticultural Meetings.

The Germantown Horticultural Society's meeting on Monday evening was rather slimly attended. President Edward Neville occupied the chair for the first time since his election and was warmly welcomed. The garden competition has not attracted much attention so far, but the plan will be tried probably on a small scale. Among the plants exhibited were a fine specimen Azalea Madame Van der Cruyssen and some small plants of Kalmia latifolia from Albert Woltemate.

My account of the spring show of the Pennsylvania Horticultural Society has been criticised. It is said that the paragraph conveys the impression that the show was a very fine one. I think the criticism is just. What was shown was of good quality but the show was very small. The florists cannot be expected to do much at this season. If a spring show is not well supported by the private places it can hardly be representative.

Expressions about Easter Business.

The Review desired expressions of opinion about Easter from prominent growers, wholesalers and retailers. It was impossible to ask more than a few, but the replies given may be fairly taken as a guide to the general feeling.

In each case a member of the firm or their foreman was asked:

"Did you have a good Easter?"

"Yes, sold everything," Wm. K. Harris.

"Could have sold two thousand more lilies," Robert Craig & Son.

"Not an Azalea left," Henry A. Dreer.

"First rate; never better," Robert Scott & Son.

"Cleared up pretty well," Samuel S. Pennock.

"Would have been even better had stock come in time." Edward Reid.

"What do you want to know for?" This Americanism from Albert Woltemate who afterwards added, "Better than last year."

"Very good," Edwin Lonsdale.

"Plants led cut flowers," William Bergen.

"Good," Pennock Bros.

"Really good, but room for improvement," Robert Crawford, Jr.

"Excellent," J. J. Habermehl & Sons.

"Good business," Smith & Whiteley. The full force of this can best be appreciated when it is remembered that though this firm seem to the casual observer to dispose of a good share of stock, the junior partner has heretofore always shaken his head mournfully and replied: "I don't know how things are with others, but with us they are very slow."

"Pretty fair," Stokes & Coeleur.

"Excellent," Charles H. Fox.

"First rate, though some stocks were unsold," George Craig.

"Very," David Cliffe.

Notes.

At the April meeting of the Gun Club George Anderson broke 25 targets straight at known angles.

Large quantities of exquisite arbutus are offered on the street. One of the fakirs was asked the price and said it was "ten cents a bunch in the morning." What do you suppose he meant? J. W. Y.

WASHINGTON.

Now that everyone has had a chance to look over his Easter trade it is the opinion of one and all that they did pretty well. All are satisfied with their efforts and there are no "if I had done so and so I would have, etc." Everyone seems to have had just enough to satisfy their trade, without having a surplus, or not enough. It was neatly planned.

The present week has been extremely quiet. Spring blossoms are appearing on the streets, such as cherry, peach and a few apple blossoms. Several of the stores are exhibiting some fine rhododendrons in pots, which are very showy.

The Commercial Florists extend their thanks to the Review for the able editorial of last week on the free distribution of flowers by the government. W. H. K.

THE WASHINGTON MEETING.

Editor Florists' Review: In reply to Mr. A. Gude, who, in his article in The Review of April 14, asks me to "stick to the truth," I would say I try to do so at all times, and he has known me long enough to know that I do.

I have nothing to change in the article I wrote concerning the meeting of the executive committee of the S. A. F. in Washington last month. Upon interviewing all who were approached by Mr. Gude, I find they agree with me that my statement was as they understood it. W. H. K.

PITTSBURG.

Business is keeping up well. A fair demand for cut flowers and the usual amount of funeral work allows no accumulation of surplus stock. Bulbous stock in this vicinity is about exhausted except lilies; this will have a tendency to increase the demand for roses and carnations.

Visitors last week were Messrs. W. F. Kasting, Buffalo, N. Y.; H. Zyp, of H. Zyp & Co., Uijgest, Holland.

At a recent visit to the greenhouse of Mr. Wm. Lauch, Carrick, Pa., your correspondent found everything in fine condition. "How was the Easter trade with you?" "Very good; better than ever." Mr. Lauch is one of the largest growers of carnations in western Pennsylvania.

The next meeting of the Pittsburg and Allegheny Florists' and Gardeners' Club will be held Monday night, April 25th. T. P. L.

WANT ADVERTISEMENTS.

SITUATION WANTED—An experienced florist (of 20 years) and wife wish a situation to run a flower store or work in greenhouses as makers up of florists' designs. Best of references. Man a total abstainer. G. Y. C., care Florists' Review.

SITUATION WANTED—By young man, in retail flower store, ten years' experience. Capable to take full charge. Address W. W., care of Florists' Review, 56 Pierce Building, New York City.

WANTED—Young florist for greenhouse work; steady place for the right man. Garfield Park Floral Co., 1688 West Madison Street, Chicago.

FOR SALE—A well established flower store in one of Chicago's busiest streets at a reasonable price. Address E. Kitzinger, 867 Milwaukee Ave., Chicago.

WANTED—Good young florist for store and greenhouse. Address H. N. Bruns, 690 W. Van Buren Street, Chicago.

WANTED TO RENT—Greenhouses in good working order, by experienced grower, or will run place on shares. Writing, give particulars. C. B. A., Florists' Review.

FOR SALE—At a bargain, 4,000 feet of glass, well stocked, with seven-room dwelling, barn and stable, everything in good repair, in a fast growing city of 40,000. A fine chance for a young man with push. For particulars address E., care of Florists' Review.

SITUATION WANTED—By experienced gardener: single, 25; in private place; understands care of greenhouses, fruits, everything in general; best of references; California preferred. Address P. Hanson, box 251, Mamaroneck, N. Y.

FOR SALE: 1 dwelling house, 2 greenhouses, 17 x 150 newly built: well located and good home trade, on st. car line and near a city of 300,000 population. For particulars address P. O., care Florists' Review.

SITUATION WANTED—By A1 grower of roses and other cut flowers and plants, as working foreman; has held similar positions in Chicago; best of references. Address E. C. care Florists' Review.

SITUATION WANTED—By a first-class florist; single, German, 36 years of age, with 20 years' experience in growing roses, carnations and general stock; can furnish best of references. H. C., care of Florists' Review.

SITUATION WANTED—By florist and gardener; good grower of roses, carnations, mums and general stock. Only those in need of a good man and are willing to pay fair wages need apply. Address K. K., Florists' Review.

FOR SALE—Six greenhouses, about 14,000 feet of glass; well stocked; wholesale and retail town of 4,000; no competition; less than 100 miles from Chicago; two railroads; good seed trade. For particulars address A, care Florists' Review.

WANTED—Two good greenhouse assistants; please give experience, references, etc.; wages, $9.00 per week. Address J. A. Peterson, 105 E. 4th St., Cincinnati, Ohio.

SITUATION WANTED—By a first-class grower of roses, carnations, violets, etc.; 12 years' experience and can furnish best of references. Address Practical care Florists' Review.

WANTED—A first-class grower who knows enough to run a place on business principles, to buy one-half interest and take full charge; must thoroughly understand the business. If dissatisfied with his purchase any time within one year he can have his money back. For particulars address A. H., care Florists' Review.

SITUATION WANTED—By expert grower of plants and cut flowers. Competent in every department. Seeks a situation where he may have a chance to make his services worth more than in his present place. Can surely advance his employer's interests if given suitable opportunity. Address S. D., care Florists' Review, Chicago.

WANTED—A working foreman, must be an A 1 rose grower, American preferred, but must be able to furnish the best of references. No fakes need apply. The plant is backed by wealth, therefore, will have none but the best. A good salary will be paid to the man who can prove his ability. In writing, send copies of recommendations and address. Address L. T., The Florists' Review.

WANTED—An industrious, energetic married man with no children. Man to work in rose and violet houses, wife as packer of cut flowers, etc. Wages, combined, $45.00 (forty-five dollars) per calendar month and two rooms free. None but those who have had experience need apply. Anchorage Rose Co., Anchorage, Ky. Chas. Rayner, Manager.

Clear Cypress Greenhouse Material.

This *with us* means the best growth of Cypress Lumber and the best grade of that growth; and from this grade all the sap—bright sap, which only experts can detect—as well as stained sap, knots and other defects cut out. Others do not equal our quality if they do beat our prices. It is not hard to see the reason: You can not buy gold dollars at fifty cents each. Experienced growers know that the best is not too good and cheapest in the long run.

Write for Circulars or Estimates.

Lockland Lumber Co.,
LOCKLAND, O.

SOW NOW

PRIMULA SINENSIS FIMBRIATA,
(or CHINESE PRIMROSE.)

ENGLISH "GIANT EXHIBITION PRIZE" STRAIN.

A unique strain adapted for every purpose, but especially valuable for Florists. This seed has been saved by the most experienced grower in England. Madam Salleroi, from flats, $1.25 per 100; $10 per 1000; same from 2½-in. pots, $2 per 100; $18 per 1000. Above are rooted cuttings, except where noted. Cash with the order.

J. E. FELTHOUSEN, Schenectady, N. Y.

CHICAGO.

The Market.

The usual after Easter conditions prevail. There is an abundance of all stock and prices rule very moderate, an occasional large lot selling at rates considerably below quotations. Still, up to date, there have been no serious gluts and the average of sales has been satisfactory for the season. Quite a number of belated lilies are seen and the demand is very light. Beauties range in price from 50 cents up to $3 a dozen, and tea roses from $2 to $5 per 100, according to quality. Carnations range from $1 up to $4 per 100, and occasionally a few extra fancy, such as Mrs. Bradt, go as high as $6, but the great bulk of the stock goes at rates near the lower quotation.

Club Meeting.

The private gardeners did not turn out very liberally at the last meeting of the Florists' Club. They missed an interesting paper by Mr. Edgar Sanders, entitled "Facts and Fancies of an Old-Time Gardener." Mr. Sanders began at the beginning, starting with the experiences of Adam as a gardener, but working quickly up to more recent times. He told many interesting anecdotes of the experiences of the old-time gardeners in this country, and concluded by calling upon Mr. John Reardon, gardener to M. A. Ryerson, who described the products and handling of the greenhouses under his charge. Mr. Reardon has been very successful with fruits and vegetables under glass, as well as with flowers and plants. Mr. P. N. Neiglick told many interesting bits of his experience when a private gardener in Europe.

The adjourned session was held in a new bowling alley, which is full regulation. Most of the boys are out of practice and the scores wouldn't look well in print.

Various Items.

Mr. Fred Heinl, of Terre Haute, Ind., is in the city.

Walter Heffron, has taken his new position with E. C. Amling.

James Hartshorne has returned from the east. The building of the new greenhouses at Joliet will begin in July.

HUNT'S REVIEW OF THE CHICAGO MARKET.

The market has not at this writing recovered from the bad turn that seized it Wednesday last. Immense quantities of flowers, especially roses, have been put on sale, and while the greater part has been moved through legitimate channels, it has only been through the medium of very low prices. Saturday several large funerals helped to clean the market up in pretty good shape. Smilax continues scarce, violets are nearing the end of their season, as also are the common ferns; valley in only fair supply; Harrisii, so scarce at Easter, are now positively not wanted. Lilac of fine quality is arriving in quantity now.

We look for an improved condition of the flower market from now on. Prices will not be high, but we think stocks will be moved at fair figures.

FORCING BULBS.

We have closed contracts with some of the best and most reliable producers for our stock of

Roman Hyacinths, Tulips, Dutch Hyacinths, Von Sion Narcissus, Paper White Narcissus, Valley, Harrisii, Longiflorum, Azaleas and all leading Forcing Stock.

Give us a list of your wants and we will quote same. Don't forget that we are strictly in it on SUPPLIES OF ALL KINDS,

SEEDS, BULBS AND CUT FLOWERS.

VAUGHAN, McKELLAR & WINTERSON, 45, 47 and 49 WABASH AVENUE, **CHICAGO.**

GRAND RAPIDS, MICH.

Easter week opened raw, cold and uninviting, carrying a chill to the hearts of the craft, but Friday dawned mild and springlike, dispelling all dread of the wrapping of plants, incidental to cold weather. The volume of business was in excess of last year; the stores sold out close. Crabb & Hunter's special plant sale was a success. The greenhouse trade was more than satisfactory and presages a good spring trade.

As predicted, carnations were scarce and retailed for the highest price ever known at Easter, 50 to 75 cents per dozen. Roses were about equal to the demand; price $1.00 to $1.50 per dozen. Bulb stock was plentiful and materially helped out the cut flower sales. Tulips were 50 to 75 cents per dozen; narcissus, 60 to 75 cents; violets, 15 cents.

Most of the churches were elaborately decorated, using up cut and potted lilies, tulips and narcissus. The demand for potted plants is on the increase. Lilies are the most popular, and sold out close. Colored azaleas sold readily, while white were not in much demand. Genistas sell poorly and hydrangeas are on the decline.

The few lilacs offered by the stores found a ready sale. Tulips, hyacinths and narcissus in pans at 25 to 75 cents each sold out clean, and many more could have been disposed of. Cinerarias, although on the decline, still have a hold on popular favor. Very little attention is now given the once popular Calla, and it is grown in but limited quantities.

The demand for flowers the past week has dropped to the normal conditions prevailing previous to Easter week; business good, supply adequate, quality of carnations the best during the winter. Those benches of carnations which were off crop at Easter are now beginning to give an account of themselves, increasing the supply materially, and from now on to Decoration day will be plentiful. Roses are beginning to feel the effect of the warm weather and violets are poor.

The following prices prevail: Carnations, 25 to 50 cents per dozen; roses, 75 cents to $1; Harrisii and callas, $1.50; valley, 50 cents; violets, 15 cents.

J. LOUIS LOOSE, Washington, D. C.

Please mention the Florists' Review when writing advertisers.

HORNELLSVILLE, N. Y.

The origin of many good things is a mystery. This is the case with W. A. Wettlin, who possesses a double petunia, which deserves wide recognition. It is a pure white flower, averaging 4½ inches across, highly scented and of a robust habit, very free, a grand florists' flower.

Commenting upon Easter business, Mr. Wettlin was highly gratified with results. Blooming plants of any kind sold well, particularly a fine batch of hybrid roses in pots. His grower, Carl Sackmann, was as a Meteor amid the Daybreaks, of which there were abundance just at the right moment, and Scotts by the hundred, but not a bloom left on Easter Sunday.

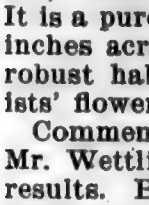
Amongst a general well grown stock I noted particularly some pretty plants of Rex begonias, including that exquisite variety, Lucy Closson; also a few perfect specimens of Polystichum setosum, which is a gem of the first water among ferns, when well grown, as are these plants. W. M.

PROVIDENCE, R. I.

Easter business was most satisfactory, is the unanimous verdict.

T. O'Connor was kept rushing for several days ahead with his big staff, watching the Easter stock, with the result that he had a splendid lot, both of flowering plants and cut bloom.

E. J. Johnston could have sold many more azaleas, the demand being unprecedented.



Geo. Johnson & Son were on hand with a fine lot of lilies, and I understand F. Macrae and W. Hazard were right in line with lilies and carnations.

M. Sweeney and W. Flanagan had a good run, both on plants and cut flowers, for church work.

W. Appleton, Jr., does a big business in this branch.

W. Butcher, who has been sick, was able to attend to the extra demand, and "Little Rhody" says all is O. K.

W. M.

EMPRESS the Rich New CRIMSON GARNATION.

Perfect in color; always in demand. Good stock now ready, $10.00 per 100, $75.00 per 1,000, or $2.00 per dozen. Strong plants from soil. All the leading varieties.

GEO. HANCOCK & SON,
GRAND HAVEN, MICH.

New Forcing Rose.

Mrs. Robt. Garrett, Hybrid Tea.

Rich, soft pink buds, very long, flower extra large, delightfully fragrant, rivaling Bridesmaid in color, but larger and much more productive. A sturdy vigorous grower. A money maker and a triumph of American skill. The best firms in the country are investing in it. It has won numerous prizes and elicited the most favorable comment from critical judges.

Price, strong plants, from 2½ inch pots, $25.00 per 100. In lots less than 1000 $225.00 per 1000.

Orders booked now, delivery March 15th, 1898. Correspondence solicited.

Peat $1.20 per bale, quality A No. 1.

Z. K. JEWETT & CO.,
SPARTA, - - WISCONSIN.

ELMIRA, N. Y.

While writing these notes I am inhaling the delightful fragrance from a bunch of Grove P. Rawson's famous violets gathered during my visit to his extensive plant, bearing evidence of the recent scrimmage consequent at Easter, which proved a most successful and satisfactory period all around.

Long ere dawn those exquisite Daybreaks and Scotts were distributed to help out those who had fallen by the way, and this happened to many carnationists. Roses helped to some extent, but even this fine stock took second place in demand.

Violets sold by the thousand, and while an exact count of the crop was not obtained the number was enormous. Notwithstanding the recent trying weather the yield is most pleasing, decreasing somewhat in size, but in color and fragrance fully equal to midwinter production; the plants are very healthy. I looked closely for a spotted leaf as I had a wager staked upon the result, but failed to find one and lost thereby.

The Fisher carnation is largely grown for summer use. It really is at its best now, but will continue to yield particularly when sash is taken off. I noted a grand house of Kaiserins in first crop for summer use. Of a batch of 20,000 geraniums double-pink Frances Perkins and Apple Blossom are pre-eminent. Peach Blossom is a single and should be in every collection. Sam Sloan is the favorite scarlet.

In looking over the cut in the subterranean refrigerator, my eye lit upon a mum, but it was not either Chadwick or Yellow Fellow. These will be manifest in due season and strongly, judging by the orders placed and inducements offered to compete for the premiums. Whoever wins the wheel should be envied; it's worth trying for.

Hoffman Bros. report a larger decorative demand at Easter than usual. They are equal to all emergencies, with capital stocks of both plants and cut flowers. The seed department is in full swing and the rush of planting fruits is a sure sign of spring. They possess a healthy stock of all that adorns the outside, and sweet to the palate.

Ed Hoffman is so rushed that h's trusty rifle has become rusty, so that in case of war some little preparation would be necessary; but with us he does not believe his assistance will be required just now anyhow. Wait until the dull season before acting. W. M.

WILLIAMSPORT, PA.—Good stocks and abundant to fill the big stock of orders, is Evenden Bros.' report of Easter business. There is a "ring" of satisfaction in such a tone.

SUNBURY, PA.—C. E. Rossiter reports a good Easter. His stocks, particularly roses and carnations, were in excellent shape.

NOW READY, 1898 TRADE LIST.

ABOUT JADOO.

At the recent exhibition in New Orleans Mr. Harry Papworth won nineteen first prizes and two second prizes with plants grown in Jadoo fiber and watered with Jadoo liquid. His palms, ferns, crotons and dracaenas were especially fine. Mr. Papworth is a firm believer in Jadoo.

Referring to his experience, Mr. W. N. Craig, Taunton, Mass., says: "We have tried ferns, pandanus, crotons, dracaenas, cypripediums and some other plants in pure Jadoo, and all are doing finely. For seed growing when finely sifted, it is admirable; the seeds germinate more quickly than in ordinary composts, there is no trouble with green scum or weeds, and far less danger of the soil becoming dry. We have noticed disparaging remarks on Jadoo from some growers who have used it, but our experience runs in an entirely opposite direction."

Wm. Robertson, gardener to J. W. Pepper, Jenkintown, Pa., says: "Of course, Jadoo is a new thing, and I had to learn how to use it to get good results. I would say that strong feeders after having been in Jadoo for some time require an application of Jadoo Liquid occasionally to restore plant food used up. In some cases I use pure Jadoo, and in others I mix loam with it. If those that use Jadoo want the best results attainable with any compost, my advice to them is to pack the material as firmly as possible about the roots, and use good judgment in watering so as not to overdo it."

Alex. McLellan, the well known gardener of Newport, R. I., writes: "I believe Jadoo is of great value, if used intelligently. Among the plants that I have found to do well in it are those having fleshy roots, such as alpinias, hedychiums, cannas, anthuriums, and among the ferns the nephrolepis do well. Adiantums I find do well in a compost composed of two parts fibrous loam to one part of Jadoo. In fact, that will answer for most stove and greenhouse plants. In preparing the Jadoo it should be rubbed through a sieve of one-half inch mesh, so that it may be thoroughly incorporated with the soil. A batch of dracaenas (cordylines), potted off about the first of October, 1897, one-half of the plants in ordinary potting soil which had been composted with cow manure and bone meal, the other half into Jadoo Fibre, using half a size smaller pots, both lots having been stood side by side and watered only with clear water, today, April 6th, it is found that those grown in Jadoo Fibre are not only larger, but of a better color, with a further advantage of being in a smaller pot, which is a great advantage when small vases are to be filled."

Extra select stock at Kennicott Bros. Co., Chicago. All flowers in season at lowest market rates.

WE HAVE A LARGE STOCK OF

HYDRANGEA OTAKSA...

in 6-inch pots which needs room. They are very strong plants that should be spaced, but we are crowded for room and cannot give them the space that they require. In order to work off a block of them quickly, we offer them for the next week or ten days at a special price. They are now coming into bud, and should give from two to three flowers each. They will make first-class plants for spring sales or Decoration Day. If we could give them sufficient room, they would be worth $6.00 per dozen next month, but as we are crowded for space, we offer them for immediate shipment at only.... **$3.00 Per Dozen.** **They are a BARGAIN AT THIS PRICE.** If you can use any Hydrangeas, now is the time to buy them. Speak quickly if you want them. We have a large stock of larger sized plants, assorted sizes, which we will be glad to quote on application.

We have just received a large importation of

CYCAS REVOLUTA....

in the finest possible condition. The stems are medium sized, six to twelve inches in height (most desirable size), and the stock is the true long-leaved variety. **Price, $10 per 100 lbs.** We will be pleased to quote special prices for large lots.

We have also just received a large importation of

STANDARD AND PYRAMIDAL BAY TREES

extra large plants, seven feet high and four feet in diameter. We offer these for the next week or ten days at a special bargain—**$15 each, spot cash.** Regular price, $20.

WE HAVE FINE STOCKS of all the newer and choicer introductions in Cannas, Chrysanthemums, Dahlias, Carnations, large stocks of Monthly pot-grown Roses, strong dormant hardy Hybrid Perpetual and Climbing Roses, Crimson Rambler, etc. Also an exceptionally fine stock of Palms and other Decorative Plants, especially large Arecas, Araucarias, Ficus, Latanias, etc. If you have not already received our Wholesale List, we will be glad to mail same on application.

ERIE, PA.

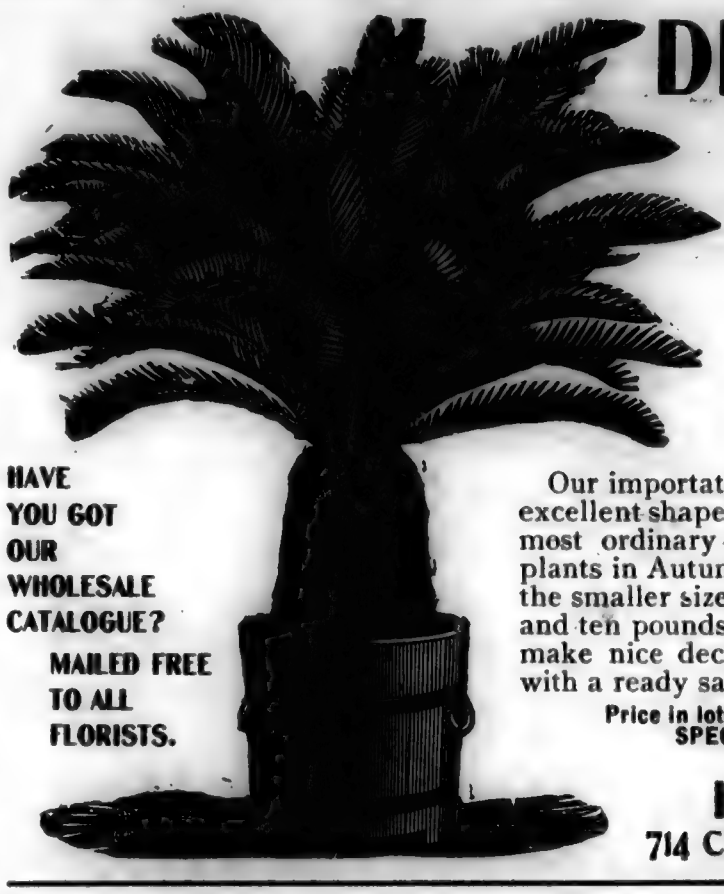
One of the best selling plants at Easter was Bougainvillea Sanderiana. Henry A. Niemeyer had a fine lot of this pretty plant and sold entirely out; other stocks sold well. He has a house of pot grown maidenhair ferns in 4 and 5 inch pots that are hard to beat; expects to dispose of the majority with a capital batch of spiraeas at Decoration day.

Roses and carnations are in excellent trim. The new kinds, Snow Queen, Rob Roy and Uncle Sam, are doing nobly, the latter needing a few stars to complete "Old Glory" represented in the divine flower. I think all should try a few plants of each of these varieties.

Two houses, 22x100 and 22x125, respectively, have recently been added, composing a substantial and most convenient range of glass. A large decorative business is done, two big houses alone being devoted to plants for this branch.

I expected to find Henry Tong at Ashtabula, where he recently purchased a plant consisting of four houses, each 20x165 feet, in addition to several acres of land. He intends to grow a general stock and cater to local retail patronage. Hitherto smilax has been the sole crop. He will continue the management of the Massasauga gardens here, where he has raised such excellent stocks, especially grapes, notably the variety Madresfield Court Muscat.

I noted a capital thing in a batch of sweet peas grown in pans, with say four stakes on the outer edge and occasional bands of twine (Friend Scott would suggest raffiia). These are about three feet tall, stocky, just showing buds in abundance, and will be sold upon the market at doubtless a popular figure.



Mr. Tong's pet carnation, named Lizzie Tong, is a beauty, much superior to Mrs. Bradt, being freer and more delicately marked, with the sweetest clove scent; a continuous bloomer, not a cropper, undoubtedly the finest fancy of its class upon the market today. W. M.

CORNING, N. Y.

As busy as the proverbial bee is A. H. Woeppel with Easter wedding orders. Never had such a rush, nor had such fine stock, particularly roses, Brides and Maids. Two houses were recently added for carnations, with a handsome palm house running the entire length of his frontage, giving a handsome effect and must attract an increasing patronage.

IT WILL BE to your advantage to mention The Florists' Review every time you write an advertiser.

WE HAVE PLEASURE IN OFFERING TO THE TRADE THIS SEASON FOR THE FIRST TIME ONE OF THE

Finest Novelties in Chrysanthemums

EVER SENT OUT

MRS. O. P. BASSETT

It will only be necessary for us to state that this is a **YELLOW MRS. HENRY ROBINSON** to ensure for it a large sale. It is a sport from Mrs. Henry Robinson, with which variety it is identical in every respect except color, being a delicate primrose yellow, deepening toward the center of the flower. It has been thoroughly tested, and is a novelty of sterling merit. One of the most eminent eastern growers who has tested it states that it is one of the best things in Chrysanthemums sent out in some time. Every Chrysanthemum grower will want it. **A Yellow Mrs. Henry Robinson** will be a money-maker and a fine exhibition variety as well. Plants now ready for delivery. We have also fine stocks of the other finer introductions of the year—**FRANK HARDY, MRS. H. WEEKS, AUSTRALIAN GOLD.**

Price, $3.00 per dozen; $20.00 per 100.

Wm. H. Chadwick, $6 per doz.

The Yellow Fellow, $3 per doz.

Pennsylvania, Autumn Glory, Solar Queen, Black Hawk, Quito, Thornden, $ 5 per doz. $35 per 100.

Boundless Snow, Mrs. C. H. Peirce, Miss Gladys Vanderbilt, $3.50 per doz. $25 per 100.

WE offer also all the best of the **Novelties of 1897** and the **Best Standard Sorts.** Send for our wholesale list and large descriptive catalogue, giving full list of varieties and prices. We have a very large and fine lot of **Novelties in CANNAS** for 1898, also best and latest introductions in Carnations, Dahlias, Strong Field-grown Roses and other Hardy Plants, a large and fine collection of Palms and other Decorative Plants, etc., etc. We will be pleased to send our wholesale list and descriptive catalogue to any who may not have received them.

GO-OPERATION

IF you are in the trade and are not yet a subscriber to the FLORISTS' REVIEW, send in your name and one dollar now and you will receive not only the FLORISTS' REVIEW for one year, but also a certificate entitling you to the earnings on one dollar's worth of stock in the Florists' Publishing Co.

Why do we make such an unparalleled offer? It is very simple.

You will have an interest in the success of the paper.

You will see that you can buy everything you want to just as good advantage from advertisers in the FLORISTS' REVIEW as elsewhere and at the same time benefit yourself by increasing the earning power of your certificate.

This mutual arrangement cannot fail to bring to the paper a heavy advertising patronage, and as a result the stock represented by your certificate will earn good dividends.

And the more you buy of advertisers in the FLORISTS' REVIEW (always mentioning the paper), the larger your dividends will be.

You get the best paper in the field and a share of its earnings.

Send in your subscription now.

Vol. 1. CHICAGO AND NEW YORK, APRIL 28, 1898. No. 22.

Easter Basket of Lilies, Azaleas, Hyacinths and Ferns.
Arranged by Mr. E. Wienhoeber, Chicago.

SPRING BLOOMING PERENNIALS.

The past winter has been remarkable for its mildness; not one of the many species of perennials, even those of a rather tender constitution, have suffered in the least, neither from frost nor by too much moisture, and everything has started vigorously quite early in March, much earlier, in fact, than they are accustomed to show any signs of growth in this latitude. At the end of March we very seldom can boast of having anything in bloom in our borders, excepting perhaps the little scillas, snowdrops, puschkinias, chionodoxas, crocus and other bulbous plants, but hardly any of the real so-called herbaceous plants show any inclination to flower until well along in April.

This season, however, was an exception and a surprise to many of us. The English primroses and their hybrids were out in full flower on the 20th of March. Aubrietias were then quite well advanced, with many of their little flowers fully opened out. Arabis albida was also beginning to look gay and bright, and the rarer A. rosea was well studded with its numerous rosy lilac flowerheads. Megaseas made a decided show with their bright pink spikes, rising from among the well preserved, shiny, large leathery leaves. The charming, free blooming hepaticas were ready to burst open with hundreds of their variously colored buds, the large flowering single white being about the very earliest one among them. Erythroniums in several colors were well developed and are perfect as ever today (April 19).

The first week of this month brought on several days and nights of severe hard frosts. We feared serious and permanent injury to such things as were well advanced, but no great amount of damage can be noticed on any of these plants now; though for a few days some of them were drooping and looked as if they never would put up their heads again, all look today as bright and cheery as ever before, covered with a profusion of flowers and with perfect, unharmed foliage.

Other spring flowers have come out since, such as the yellow calthas, the whole of the phloxes of the subulata section, and P. amoena, a great many

varieties of primulas, the pretty Iris pumila, nearly all the violets. Anemonella thalictroides is well set with pure white anemone-like flowers. It is decidedly ornamental, planted in clusters left undisturbed for a number of years, the same as the hepaticas. Sanguinaria is out in great shape, Alyssum saxatile compactum is a perfect sheet of gold, and Doronicum causasicum and D. austriacum have opened many of their yellow flowers within the last week, the former a few days ahead of the other. Pulmonarias are at their very best, and will retain their present appearance until a few successive real hot days may spoil their beauty. Mertensia virginica is a great attraction when planted in good-sized clumps or patches. The peculiar luster in the blue flowers nas a magnificent effect in the border, near or among the snowy dwarf phloxes. Waldsteinias have sent up many of their flower stems among the softly tinted young foliage, opening their yellow, bright flowers quite freely within the last few days, and the dwarf light blue Polemonium reptans is fast approaching full development.

A large number of other spring blooming, hardy plants are in bud and will be out in a week or so, two to three weeks ahead of an ordinary season, perhaps, but not lacking in their usual vigor or freedom of bloom. Our borders will therefore presumably present a gayer appearance during the month of May than we might generally expect at that time. The early bloomers will be there, in addition to the later flowering species, and combined they are sure of creating grand effects.

Spring flowers in the garden are more highly appreciated because our beds were for months without color. We welcome the opening of the first little, modest snowdrop with far more enthusiasm than we do the first appearance of the beautiful rose in June, when flowers of many kinds are not at all scarce. We wait eagerly for the opening of the comparatively insignificant little blossoms of the Tiarella cordifolia, while later on the stately, large clusters of bright colored phloxes receive but a passing notice.

A special place for these early spring flowers might be provided in many city gardens; under the shelter of a fence or building would be a good situation. It can be arranged with but a small outlay, and the pleasure derived from such a little border or bed will undoubtedly be far greater to a majority of flower lovers than the most gorgeous display in a large bed of summer blooming bedding plants could afford them. Moreover, there is no difficulty in the care of these hardy things; they may be left alone for some years without dividing or replanting, and when they do need this, we do not sacrifice next spring's display when we perform the operation soon after their flowering period is over.

It is surprising how few people think of preparing a corner for hardy early spring flowers; most of them are contented with the regulation bed of tulips or hyacinths, which in turn and due time are replaced by bedding plants for summer and early fall blooming. Along the fences they usually have a border planted with flowering shrubs, between and in front of these would be an ideal place for the

Acacia Drummondii, trimmed with yellow ribbon. By Stumpp, New York.

dwarf early spring flowers, but until very lately we seldom could induce people to try the experiment. For the last few years, however, a demand, though limited as yet, has sprung up for such early hardy things which are suitable for planting in front of medium sized shrubs, proving to some extent that their introduction has, in a majority of cases, been entirely satisfactory and is appreciated by neighbors and visitors who were given opportunity to view such plantings while in bloom.

Undoubtedly this existing demand will from now on grow more rapidly. Every indication points in that direction, and it is well if our florists or growers are prepared to furnish a full line of at least the most desirable hardy perennials, if not a more complete collection, which not everybody can afford to plant and keep up in proper shape and condition.

J. B. KELLER.

VIOLET NOTES.

In this section this week (Saturday, 23rd inst.) has been so damp and cold, and, in fact, has rained off and on, that we have been unable to do anything to our violet ground towards making it ready to put out the plants. We like to get out our violets fairly early, as we usually have a dry period in May, and if we can get them out in sufficient time to have them take hold before that comes, it is much easier to care for them, and there are not so many vacancies, owing to their dying off.

The one great trouble in getting them out early is the fact that too often the ground is too damp to work to advantage. I would prefer to put out the plants late than have the soil worked when in too wet a condition. We use a Planet Junior hand cultivator, as we prefer it for several reasons. More plants can be grown on a given piece of ground, as one can plant closely, and then, too, a hand cultivator is too large, taking up too much space, and not admitting of close work, with consequently increased trowel work.

The distance apart to plant must be regulated more or less by your cultivator. We plant about twelve inches apart in the rows and from four to six rows, the same distance apart, leaving a space of two rows. We like to plant as deeply as possibly, at the same time keeping the crown well above the soil, so that there is no danger of its being buried by heavy showers.

Of course, these articles are needlessly explicit for old violet growers, but they are not intended for their special edification, except inasmuch as they show how our methods may vary in attaining the same results in different localities and with different soils, etc. They are especially intended to help those who have paid no particular attention to their culture in the past, and those who have a small house in connection with their other houses.

Another point about which we are particular is to immediately firm the soil with the toe when planting, throwing a little loose dirt over this with the trowel. If the violets have been pricked out in flats, we have one person who loosens them, cleans off any superfluous leaves, leaving only about two developed leaves and any signs of runners that may begin to start. Do not allow many to be trimmed in advance, or the sun to shine on the roots, or the wind to blow on them, as it only takes a short time to seriously injure them in this way.

R. E. SHUPHELT.

IT WILL BE to your advantage to mention The Florists' Review every time you write an advertiser.

CARNATIONS

VARIOUS QUESTIONS.

1. Will you please explain just how to wire a carnation bed 110 feet long and 17 feet wide with your overhead system? What supports do you have at the ends, sides, and in the bed? Do you run wire between each row of plants, and how far from soil, and will that keep them off the ground? Also, the kind of wire and what it costs?

2. In growing the finest grades of carnations, what fertilizer would you prefer if you had your choice of cow or horse manure?

3. What is the best shading material to put on the glass for summer that will come off without trouble in the fall? X. Y. Z.

---

1. In regard to wiring the above carnation bed, this question is rather a surprise to me, for I never heard of beds 17 feet wide, unless a solid bed, and the plants planted in beds with walks between. But it is probable that he means 7 feet wide. Being uncertain as to this, I will explain how we wire our raised benches, and leave it to X. Y. Z. how he can best adapt it to his purpose.

I infer from the way the questions are asked that X. Y. Z. has no clear idea of the principles of our system. These overhead wires, with the corresponding twine netting, are not for the purpose of keeping the plants off the ground, but are only a support for the flower stems.

To keep the plants off the ground, we use the A shaped wire netting between the rows across the bench. This wire netting, when bent in shape, is six inches high. Five or six inches above the netting, according to short or long stemmed varieties, we stretch the wire lengthwise, fastened on a firm support on each end of the bench.

This support is constructed of three-quarter or one-inch pipes set in the ground and fastened to the bench with clamps. We generally use two tiers of these wires, the second six or eight inches above the first, and construct these supports with two crosspieces at the desired distance, one above the other. We stretch the wires eight inches apart, irrespective of the number of plants in a row, as they are merely for the support of the flower stem. Every fifteen or twenty feet light wooden supports are placed under the wires, to hold them up to the desired height, and the wires fastened to them with double pointed glazier's tacks. Between these wooden supports we use a very light piece of lath, only strong enough to hold the wires at the regular distance apart, to prevent their drawing together when the twine netting is put on. These laths are notched at the end to hold the two outer wires and the others are fastened to same with a glazier's tack.

For the twine netting we use the common cotton twine, running diagonally across, and recross the bench until the other end of the bench is reached. The twine is run six inches apart, and fastened to each wire by winding it around once, and on the outer wires where the turn is made twice, so when completed the whole forms a netting of diamond-shaped squares, with ample space for the flower shoots to grow through them.

The A-shaped wire netting is six inches high, and six inches above this, or one foot from the ground, are the wires stretched lengthwise, and six or eight inches above them a second tier, if desired. At our place we find a second tier necessary. The wire used is No. 15 and will probably cost for a bench 110x7 feet 60 cents—20 pounds, at 3 cents per pound, for one tier.

2. In the preparation of soil for the benches, we prefer cow manure, but well decomposed. For liquid manure we invariably use fresh cow manure. In field culture on heavy soils, horse manure has the preference; in sandy soils, cow manure. Generally, horse manure is stronger and much quicker to act, but is very liable to burn when not attended to, and its most nutritious elements are lost. Otherwise, when attended to during the time of decomposition, to prevent its burning it is equal, if not better, than cow manure.

3. In regard to shading, I refer X. Y. Z. to my last notes in an answer to R. W. This shading prepared of white lead and coal oil is probably not so easily removed as a lime wash, but it can be removed with little trouble after a whole summer's exposure, and the early frosts will aid greatly in accomplishing this work.

Rhododendron trimmed with Asparagus Sprengerii and Ribbon. By Stumpp, New York.

THRINAX PALMS.

Editor Florists' Review: In your issue of April 14, page 813, Mr. Taplin writes about Thrinax parviflora as a useful florist's palm. We wish to confirm his remarks about it as being handsome and useful and state that

it grows taller than he supposes, averaging 15 to 20 feet in full-grown trees here in Florida, where it is native.

It is extremely graceful, having slender, bending stems and shining leaves of particularly neat appearance, but it is so very slow in growth that many are discouraged with it. We have grown it for several years, and sent it out to hundreds of customers, and find that the larger ones give satisfaction. Ten-year-old specimens are in 4-inch pots, and even with frequent change of soil and every advantage in heat and situation, make but trifling growth. This species grows very abundantly on the lower Florida keys and forms dense groves near the beaches.

There are also two other species, the T. argentea and T. excelsa, which are just as common in the same region. The argentea is the smaller of these two sorts and has more elegant leaves, richly covered on the under side with a thick, silvery coat. The excelsa is much larger than either parviflora or argentea, having a trunk four to six inches thick and reaching a height of 25 feet. All sorts are of extremely slow growth. There are miles of narrow, sandy beaches backed with these various Thrinax palms, forming beautiful views, rising up from dark blue water, views which the average American never even dreamed of as belonging to our own "fair Florida."

In this connection I wish to state that the following palms are all native to Florida: Sabal palmetto, S. Adansonii, Serenoa serrulata, Chamaerops hystrix, Pseudophoenix Sargentii, Oreodoxa regia, Thrinax parviflora, T. excelsa, T. argentea, T. Garberi, Cocos nucifera, an unnamed slender palm we have found in the Everglades, and possibly one more species of thrinax, making thirteen well-defined species, contained under at least eight genera.

E. N. REASONER.

Oneco, Fla.

MISCELLANEOUS SEASONABLE HINTS.

Advising Customers.

There is often a great misunderstanding with your uninformed customers about when to plant out many of their summer flowering plants, many of them leaving the planting of "their flowers" until the end of May. It is your duty to educate and cultivate knowledge among those who by neglect of their education do not know the gardening art as you who are to the manor born. I am a little late even now on some things, but a reminder for those who have been negligent even if it benefits only one will be of service.

Hardy Plants.

As soon as the ground is dry you should plant gladiolus. If you grow them in a small way, 6 inches apart in the rows and the rows 1 foot apart will do very well, planting in drills 4 inches deep. If you grow them in large quantities and have to cultivate between rows with a horse, then throw out a shallow drill 2 feet apart and 6 inches deep and cover the bulbs with a hoe. The gladiolus does not make much growth till warm weather begins, and if you live in a latitude where frost is likely to appear at the end of September, you may as well plant them all now, for there will be plenty of stragglers continue flowering till frost comes. If you do not get frost till early in November, then you can reserve your last planting till the first of June.

Hollyhocks should be planted now or before. Don't say these majestic plants cannot be grown here, for they can. Our experience is they delight in a heavy soil, with a large quantity of animal manure. Two years ago we had a lot, and of course nobody wanted them. This year there is quite a call for them, and of course we are without them, and it is something you cannot buy. It is entirely out of season for me to tell you now how to have them, but they should be sown in August or September and wintered over in cold frames. Even with pansies the great majority of people do not ask for them till we have hot weather, when the pansy, like all the viola family, prefers to make leaves and not flowers. Tell your customers now is the time to buy and plant pansies. Pansies should now be in full bloom, and May is the month to enjoy them.

Herbaceous plants should, of course, be divided several weeks ago, but still not too late. Your customers will ask you for Ampelopsis Veitchii, which is so overdone in some cities. You should have dormant plants and plant at once. Never mind how small they are if they have two or three live eyes and good roots they are better than plants with 3 feet of vine, for all the growth begins at the bottom.

Carnations.

With all due deference for that most worthy of men from the Hoosier state, allow me to say, without any divergence from his most excellent advice, which I believe is given with as much candor and sincerity as my own, that I advised in the autumn that you "strike" a few thousand cuttings of the leading varieties of carnations. I said Daybreak, Portia, Scott and Alaska was a good selection (although these are by no means the pick of the flock today), and get them into 3-inch pots by the first of March. Whether you have them in that size or not is not of great consequence, only plant out a thousand or more, and plant them in one bed. You can pinch them once and then let them flower. By August they will be in flower and what a blessing to you, and will pay for disbudding just as much as those grown inside. The latter end of July and all through August and September and even October is when there is a great scarcity of carnations. Why I said plant them all together is because let it be a bed of a thousand given over to flower and not at all interfering with your plants that you want to lift for winter flowering.

Spiraea Astilboides.

A friend from Wisconsin wishes me to impart my knowledge of how to keep this plant in order so it can be forced another year, or what to do with it. It is so absurdly cheap nowadays that the very best answer to these inquiries is, "throw it away." More than forty years ago I can remember that Spiraea japonica (it had no alias in those days) was grown from year to year in the same pot and flowered profusely, but can you afford to water a plant all summer and store it away in a frame till forcing time for 5 cents? If so, your time is not worth much, and then it would not be half so good as a freshly imported plant. The spiraea is one of the most hardy plants of which we know, and if room permits can be planted out. It makes a very acceptable hardy border plant and flowers in June.

WM. SCOTT.

INSECTIVOROUS PLANTS.

Plants that obtain their nitrogenous food from insects were the subject of an exhaustive talk by Mr. A. Herrington at the last meeting of the Morris County Gardeners' and Florists' Club at Madison, N. J. He described in great detail the different means by which the several families of this class of plants achieve the same object, illustrating his remarks with specimens and large drawings. The droseras or "Sun Dews," a genus almost world-

Group of Sarracenias.

wide in its distribution and showing much variation of form and habit, were all uniform as to their methods of capture. The little tentacles or hair-like appendages of the leaves secreted a viscid matter, and any little fly or insect that happened to alight thereon was assuredly stuck and its doom sealed.

The independent and collective movements were explained whereby the capture was conveyed to the center of the leaf and there bathed in a fluid of a nature analogous to that of the digestive fluids in the stomachs of animals. In proof of this, he cited and related some of Darwin's extensive experiments, showing that not only the soft bodies of small insects, but meat and cartilage could be digested, and all the animal matter extracted from bone, so that only its mineral constituents remained, which crumbled to dust when touched. Darwin actually arrested the process of digestion upon some leaves with which he was experimenting by adding a grain of carbonate of soda to the secretions of the leaf glands. The carbonate of soda was then neutralized by hydrochloric acid and the digestive process recommenced.

Venus' Fly Trap (Dionea muscipula), a native of North Carolina, was next described — a veritable plant marvel that closed its leaves with electric rapidity, as its leaf surfaces were dry, with no secretions to assist in catching. Only after the insect was entrapped did secretion begin. Then the leaf glands poured out the essential fluid to ensure digestion of the captured food. The nepenthes, sarracenias and darlingtonias, with their quaint and capacious pitchers, were catching insects in different ways, but with the one set purpose, whilst yet other methods of capture, as seen in utricularias, pinguiculas and aldrovandas were briefly described.

Of extreme interest botanically, there was also a commercial aspect that might appeal to some of those present, for not a few of these plants were highly ornamental. Large collections of nepenthes were maintained in European gardens, but nearer home there was much available material in the sarracenias of the eastern states and the darlingtonias of the west. These plants were beautiful as well as singular; they could be easily and cheaply collected in large quantities, and should find a ready sale if put upon the market in an attractive manner as nice, well-grown plants in pots, or, better still, broad, shallow pans.

A BACTERIAL FERTILIZER.

Under the name of "alinit" a new manure has been recently introduced. The discoverer of this material is Herr Caron, of Ellenbach; and alinit in its present form is the outcome of four years' experimental investigations on the bacterial flora of different soils, resulting in the isolation of a particular bacillus, upon the presence of which would appear to depend to an important extent the fertility of certain soils. Caron has, according to Nature, already obtained striking results on an experimental scale with crops from soil treated with pure cultures of this bacillus—Ellenbachensis alpha, as he has called it. Alinit is sent out as a creamy-yellow powder, of which the nitrogenous constituents have been ascertained to be 2.5 per cent. Its closer investigation has been made the subject of memoirs by Stoklasa, of Prague, and also Messrs. Stutzer and Hartleb. The bacillus is contained in this powder in the form of spores, and on cultivation is found to belong to the well-known aerobic group of bacteria known as the hay bacilli, resembling very closely the Bacillus mycoides so frequently found in soil, and the Bacillus megatherium. It appears to grow easily upon all the usual culture media. Before its precise place amongst bacterial fertilizers can be determined, many more elaborate and carefully conducted experiments must be carried out.—Gardeners' Magazine.

EFFECT OF SOILS ON COLOR.

We are familiar with the effects of different soils and chemicals on the color of flowers of Hydrangea hortensis. Through the insertion of iron nails, iron rust, steel filings, common alum, green vitriol, into the pots or root-runs of hydrangea, the colors of the flowers are more or less changed from purple to blue. It was never, however, made very obvious why solutions of common alum favored the change to blue more than sulphates or salts of iron. At the last meeting of the Botanical Society in Edinburgh, Dr. Aitken read an interesting paper on the color of flowers as affected by the character of the soil in which they grow. After referring to the generally known fact in relation to the hydrangea, Dr. Aitken quoted Mr. Barr, the greatest of our daffodil growers, as testifying to having noticed that daffodils possessed a much deeper tint when grown on some soils than when grown on others. It has also been noticed by other cultivators that on some peats hydrangeas come blue without either alum or salts of iron, and that daffodils and other bulbs are considerably modified in color. Mr. Barr had sent three samples of soil to Dr. Aitken, who analyzed them, and exhibited

the results of his analysis. The palest daffodils, having a sulphur-yellow color, were grown on the poorest soil, and the deepest colored were grown on the richest of the three soils, but it did not appear that the differences of color were due to the abundance or otherwise of any one constituent of the soil.—Gardeners' Chronicle.

Lilies, Heath, Azaleas and Hydrangeas in basket, trimmed with white ribbon. By J. H. Small & Sons, New York.

PHILADELPHIA.

Supply and Demand.

The Easter season of festivities is practically over; the market for cut flowers has consequently fallen away, and prices are much lower than one week ago. The quantity of stock is enormous; much of it remains unsold. It is unlikely that conditions will improve for the next six weeks, until the final busy days in June, when any really good stock usually finds ready sale. To have it really good then is the rub.

Fine Beauties are more plentiful, probably, than ever before. The best are extra fine, and are quoted at $4 to $5 a dozen. One can, however, by jingling two shiny half dollars together, get a dozen pretty good blooms every now and then. Brides and Maids, when nice, bring $3 to $4, occasionally more; Meteors about the same; carnations, $1 to $1.50; sweet peas 50 cents to $1.50; valley, $3 to $4; mignonette, $1 to $2, generally small; pansies, 2½ cents a bunch of about a dozen blooms. Von Sion in small quantities is coming in from out-doors and brings $2 and $3; Emperor, $4. Arbutus is plentiful and has fallen in price.

Quite a lot of palms were sold during the past week. The growers are busy getting their stock in shape for summer growth.

Penn. Hort. Society.

The Pennsylvania Horticulural Society meeting was held on Tuesday evening. The Dreer prize for pansies went to Wm. Robertson, gardener to J. W. Pepper, of Jenkintown. The Michell prize, for hyacinths, was awarded to Jno. McCleary, gardener to Wm. Weightman, of Germantown; second, to Jos. Hurley, gardener to Jas. M. Rhodes, of Merion. There were also exhibits of vegetables. H. T. Clinkaberry, gardener to C. G. Roebling, of Trenton, N. J., showed a new hybrid laelia, which received a silver medal, and a certificate of merit for Laelia elegans was awarded to Alphonse Perical, gardener to Mrs. Geo. B. Wilson, of West Philadelphia.

Notes.

The Florists' Club team has made a great record in the Bowlers' League, and now has a chance for first place.

The club is to have a benefit at the Walnut Street Theater next month. The play is "The Telephone Girl." There is also to be a shad dinner at Wissinoming in May, with other festivities besides to fill out the day.

It is not true that any of the commission houses are to become bureaus of immigration.

H. C. Faust is sending in some well flowered yellow daisies.

M. B. Bunker, of Boston, and William Edgar, of Waverly, Mass., were in town last week.

The growers of bedding plants are very busy getting everything in shape for the fateful May 10.

A rose grower came home a bit discouraged from his morning in town. His foreman urged him to see the proprietor of a certain store he had passed one evening and noticed an unusually fine display of Jacks and Brunners. The rose grower went to the spot indicated and found everything as described, excepting in one important particular—the roses in that window were the kind that don't fade!

J. W. Y.

A VISIT TO THOMAS CARTLEDGE.

Come with me in fancy, this bright Sunday afternoon, the third in April, out over the wondrously straight line of the Pennsylvania to Holmesburg Junction. There waits a solitary trolley which plies back and forth between the railroad and the Bristol pike, where the Frankford trolley line runs still further out of town, passing Academy road.

At the corner of this road and the pike, on one side of the street, is the old Brown estate; on the other is the property of ex-Senator Porter; on the right and on the left a picturesque, old-fashioned house with tall pillars and broad veranda; a pretty stretch of lawn in front, with trees just showing signs of life, and seated on the porch a family party. One of the group rises and comes forward to the gate. It is Thomas Cartledge, the man who has brought the firm of Pennock Bros. to their present high position, and better still, has won the respect and admiration of all who know him, by his uprightness and kindliness.

Azalea trimmed with ribbon, covered with Nun's Veiling. By Stumpp, New York.

Mr. Cartledge had a number of visitors this sunny afternoon. He chatted about the unusually pleasant month just passed (there was but little of the lion about this March), about the old Macalester place recently bought by Mr. Porter, who is erecting

Prize-winning group of Ferns at New Orleans. All grown in Jadoo Fibre or watered with Jadoo Liquid.

a costly wall thereon; about the high standard of The Review, and about his son's hunting dogs, so pleasantly that the time slipped quickly away. Good-by was said with the fervent hope that the warm spring weather will bring back health and strength to Mr. Cartledge, in which wish all his friends will join. J. W. Y.

PRIZE-WINNING FERNS.

The accompanying engraving is from a photograph of the prize-winning group of twelve ferns in twelve varieties exhibited by Mr. Harry Papworth, gardener to Mrs. T. G. Richardson, at the recent spring show of the New Orleans Horticultural Society. Referring to the group, Mr. Papworth writes:

"The large plant in the center is Nephrolepis davallioides furcans. The largest adiantum is A. fragrantissimum (on the right). On the left is a fine specimen of Dennstaedtia davallioides Youngii. This is the finest plant of the twelve, but did not photograph well. All these plants were grown in Jadoo Fibre. The small plant in front is Adiantum Farleyense grown in soil and watered with Jadoo Liquid. This is really a fine plant, though it appears small by comparison with the others. On the ground is a specimen of Davallia bullata. The plants on the other side of the group are A. Bausei, A. Fergusonii, and A. cuneatum elegans. On the right is a plant of Asparagus Sprengerii in a hanging basket. This was grown in Jadoo Fibre and won first prize.

WHEN you write an advertiser, always state that you saw the adv. in The Florists' Review.

ROCHESTER, N. Y.

Condition of Trade.

Weddings, receptions and various social events created a lively demand for flowers during the week, but the supply has been over plenty and prices have dropped to a much lower point. Roses, which a week ago brought readily $12 per 100, were sold at $3 and $4.00, and plenty of the poorer grades would not bring more than $2.00, retailing at all prices. In some stores, cards were up, declaring war in roses; good quality was offered there at 50 cents per dozen, while the inferior article was still below that figure.

Bulbous stuff is very cheap and slow to sell, loads of it coming in daily. Carnations also are decidedly abundant. Violets are about over in our neighborhood, excepting the old double English, which is in its prime at present and brings from 50 to 60 cents per 100. Sweet peas are excellent and quite plentiful, but they also have declined in price; 60 cents is considered the highest figure for the best quality. Lilium longiflorum are still bringing $10 to $12 and are not overdone. Smilax, though rather scarce, is quoted at $12 to $15 and asparagus never fails to bring 50 to 60 cents per string; not much of it is grown in this vicinity.

Notes.

Quite a number of flowering plants, which were left over from last week, have been used up in the various decorations or were otherwise disposed of. The display in the store windows gives evidence that there is still a good supply in all classes on hand, but prospects are that the coming week may materially assist in cleaning up all surplus stock.

Since Easter we have enjoyed mild and very pleasant weather. Trees and shrubs are rapidly budding and the early shrubs, such as forsythias, Spiraea prunifolia, etc., are in bloom and a great many perennials begin to be attractive. K.

NEW YORK.

Among the Wholesalers.

There has been no improvement in the market since my last report. No business, ice boxes full of flowers, and prices way down almost to summer rates, mirrors the situation. What is the reason? Of course there is a tremendous lot of stuff coming in and scarcely any shortening of crops. Behind all this, however, is the spectre war, war, war!!! and this seems to be the main cause for the degeneracy of the market and business, and the bearing of prices. Prices, did I say? There have been none. Stock has had no settled value and values are what you could get.

American Beauties have received terrible punishment, fine hybrids contributing a good deal towards this, and some remarkably fine stock of the following are to be seen: Brunners, Jacks, Baroness Rothschild, Mrs. J. Laing, Mad. Gabriel Luizet, Anna de Diesbach, Magna Charta and La France, prices ranging from $3.00 to $20.00 per 100. A few moss roses are to be seen, and these realize the Klondyke price of $3.00 per dozen. Other rose stock has sold as low as $5.00 to $10.00 per 1,000.

There has been and is a tremendous glut of Harrisii, selling as low as 2 cents a flower. Lilies of the valley have not been quite so plentiful as heretofore; other bulb stock a drug in the market. Fancy pinks go slowly for the first time in the season; ordinary kinds fairly well. This applies more specially to Scott, reds not at all. The best grades of all flowers are the greatest sufferers, and the Greeks are in clover.

The Retailers.

Trade is very slow in this department. The war scare has cut down the steamer trade and naturally there are less flowers used, usually quite a heavy item at this season. The future for the seaside resorts is also gloomy, as the public do not care to take any chances of dodging Spanish bullets.

A few patriotic emblems are to be seen occasionally. The Bridgeman Co. were manufacturing a cannon (smooth bore) for the officers of the Ninth Pennsylvania regiment, National Guard, when I called recently, and flags, ships of war, etc., are among the floral armament these days.

Seed and Bulb Trade.

War and its accompanying results are already having their effect on this

important branch of the business, not so much, perhaps, in the home trade as on the present and future import trade. It is almost impossible to secure freight rates for fall importations; in fact, some companies will not figure on space at all on their boats. Then, again, there is another critical question arises, as seen from the following extract of a letter from France received by a prominent house:

"In the danger of war between the U. S. A. and Spain, we are afraid that same is 'cas de force majeure' (free translation, 'a case that cannot be foreseen'), which our customers can allege for not paying for or not accepting goods ordered." So it is seen unless a customer will guarantee acceptance and payment for goods, taking the "casus belli" into consideration, considerable friction is liable to arise and great inconvenience besides.

Jersey Notes.

Last Thursday the New Jersey Floricultural Society held an Eastertide floral festival and musicale at Berkley hall, Orange. The results were quite gratifying. The floral display was grouped along the outer edge of the room and contained some very flattering exhibits.

Malcom MacRorie, the president, had an excellent group of foliage plants, particularly a fine specimen of Kentia Belmoreana. He also showed a specimen Pandanus Veitchii.

Peter Duff, the genial secretary, showed some delicious strawberries in pots, well fruited, and some well-flowered pelargoniums.

George Smith exhibited a vase of carnation Mayor Pingree, and some well grown foliage plants and roses.

James Keenan showed a well grown group of ornamental foliage plants, including some fine arecas, ferns, raphis, araucarias, etc.

John Hayes had some excellent crotons, all well colored and good varieties.

Dietrich Kingsgrab staged some very fine foliage plants, including a handsome piece of Phoenix rupicola; also specimen Adiantum cuneatum.

Thomas Urley exhibited a group of hydrangeas and Spiraea compacta, well grown.

W. A. Manda showed an excellent collection of new and rare plants, including Tillandsia fenestralis.

Dr. J. M. W. Kitchen exhibited quite a comprehensive collection of orchids, including cattleyas, cypripediums, coelogynes, laelias, etc.

Robert McArthur displayed a number of excellent carnations.

Thomas W. Weathered's Son showed a construction model of their wood and iron greenhouse, very practical.

A CAUSTIC COMMENT.

In a recent newspaper paragraph the writer speaks of the flowers in a huge floral cross as: "Beautiful parts of a hideous whole."

CHICAGO.

The Market.

Market reports are rather conflicting, but the majority feel that business is rather better than at the same period last year. With few exceptions, prices rule generally moderate, and occasional large lots go at prices discouraging to the grower. Still, there have been large sales of select stock at very good figures for the season. There is a surprising dearth of bulbous flowers for the season, which is probably to be accounted for by the fact that growers aim to have their forced bulbous flowers out of the way by this time, and the outdoor stock has not yet arrived in any quantity. First-class carnations hold their own as well as anything. Lilies are now pretty well cleaned up. One of A. L. Randall's consignors missed Easter by a very wide margin with a big lot of longiflorum, and is now just beginning to cut some very fine blooms. He expects his cut to last till Decoration Day.

Taken all in all, the wholesalers seem generally satisfied with conditions for the season.

Various Items.

Mr. E. H. Hunt is gaining, but is still unable to visit his place of business.

Mr. John Zeck, long in charge of Reinberg Bros.' wholesale store, resigned his positon, taking effect last Saturday, and is now with Mr. S. B. Winter. Archie Spencer is now in charge at Reinberg Bros. and is keeping things moving in good shape.

Messrs. O. P. Bassett and Flint Kennicott are both sojourning at West Baden, Ind.

This Thursday evening (April 28) the Florists' Club will hold its last meeting in the old quarters in the Masonic Temple. An interesting program has been prepared.

The bowlers have arranged to meet every Friday evening for practice at the new alleys under the Illinois restaurant, at 77 Randolph street, at 7:30 p. m. These are strictly regulation alleys and an attempt will be made to get the boys in good training for the match at Omaha in August.

Billy Wells, the famous North Side ex-florist and park superintendent, will soon start to the front in search of glory.

Geo. Wittbold is now fairly well settled in his beautiful new store on Buckingham place, adjoining his greenhouses. The store proper is 35x35 feet and is very handsomely fitted up. The 35 feet of store front is all glass, two of the large plates of glass being each 10x10 feet. Adjoining the store is a light and spacious workroom. At the back of the store will be built a conservatory and showhouse 35x90. Another new house is contemplated, size not yet determined, but probably 18x100. Mr. Wittbold reports a good retail business as well as a large shipping trade in palms. Kentias of good commercial sizes are scarce.

B. J. Blameuser is moving into his new place at 718 Wells street. The lot is 35x117 and he has secured a five-year lease. He has built a neat store and two greenhouses, one 55x16 and the other 95x16, the end of the latter facing the street side of the store, with a broad sheet of glass that will make possible a very effective display toward the street.

The tulips at Lincoln park are showing strong color now and will be in almost full bloom by Sunday. In a geometrical bed of red, yellow and white, the blooms are coming with remarkable evenness. The varieties are Vermillion Brilliant, Chrysolora and La Reine. These sorts are excellent to plant together, as they all bloom at just the same time, at least they do so here.

The special feature at the Florists' Club meeting this Thursday evening will be a paper on "Bedding Plants," by Mr. C. J. Stromback, head gardener of Lincoln park.

Luther C. Farwell, manager of the greenhouses at Oakwoods cemetery, committed suicide April 19.

ST. LOUIS.

Trade Rather Slow.

Trade reports are not very encouraging for the past week. There is plenty of stock in the market and very little sale for it; in fact, the general verdict is that since the war excitement there is no business in town worth speaking of.

The commission men's ice boxes are filled up to the brim, and it is only the outside shipping orders that make room for the next day's consignments. Even some of the fakirs complain that there is nothing doing just now.

Prices.

Roses are firm, but sell at very low prices. Select Beauties range from 15 to 25 cents each, and the short ones are sold for little or nothing. Brides, Bridesmaids, Meteors, Carnots and Jacques bring $4 for select stock and from $2 to $3 for seconds; in 1,000 lots the price was $10. Hybrids do not sell well, in spite of the fact that they are fine.

Carnations have been and are now very plentiful, there being a glut in all varieties, especially in reds. Whites are always in demand and sell better than any others. Reds are 75 cents and $1 per 100; same price on Scotts, Daybreak and Wocher; whites, $1 and $1.50; fancies, $1.50, and extra fine stock, $2.

Violets are growing poorer and smaller, and sell at 25 and 35 cents per 100. Bulb stock is very dull and there is very little sale for anything in this line, except perhaps valley, which

View of the wholesale store of S. B. Winter, Chicago.

brings $2 and $3. Harrisii are selling at $5 and $6; callas, same.

Sweet peas are now selling at 25c per 100, and are very good. They are not yet overplentiful, but it is likely that in a week or so the market will be overloaded with them.

There is still a scarcity in greens, and no ferns in the market all of last week. Some of the florists fell back on rose leaves for backing. Smilax is also a little scarce and in good demand at $15.

Notes.

The preliminary premium list of the St. Louis Florists' Club for the exhibition of 1898 has been issued. Class 12 this year was made for Miss Mary Lionberger, who gives $100 for premiums for herbarium collections of wild plants, such collections to be made and exhibited by pupils of any school in St. Louis or St. Louis county.

Mr. Alex. Walbart, formerly at Grand avenue and Chestnut street, will open a flower store on Grand avenue, near Olive street, before the end of the month.

Mr. C. C. Sanders reports that tree planting has been very brisk with him this season; also in shrubs and evergreens. Others in the same line report likewise.

C. Young & Sons Co. are receiving large orders from outside of the city for plants, seeds and bulbs, and from appearances business in this line will be better than last year.

Mr. H. C. Irish is now acting director at the Missouri Botanical Garden, in the absence of Prof. Wm. Trelease, who is now in Europe.

The Bowling Club.

Only eight members took part in the three games rolled by the club Monday night, the rain keeping the rest at home. Emil Schray is in form again, and was high man with 643, single score 237; C. A. Kuehn, second with 603, single score 223; Fred Weber third with 500, single score 197. This ended the April series of 12 games. Chas. Kuehn wins the average medal with 2,255; John Kunz, second, with 2,082, and Beneke, third, with 2,0o3. Emil Schray wins the high single score medal with 266; Beneke, second, with 233, and Kuehn, third, 223. The May series will begin next Monday night with 25 games of cocked hat, just for a change. J. J. B.

CLEVELAND.

Spring! Oh, Spring!
You're not such a beautiful thing,
And poets all lie when they sing
Of your m a n i f o l d charms, naughty Spring!
Measly Spring!

For 'tis the grower t h a t mighty well knows
You're the cause of one-half of his woes,
And you can't get a price for a rose
That'll pay for the wear of the hose.
Hang you, Spring!

To the above horrible result does the situation of last week lead one. Cuba libre does not so immediately burn into one's soul as flowers nearly free, a condition almost realized at the latter end of the week just past. Dry goods stores, as well as the legitimate dealers in floral products, were engaged in the pleasant pastime, and as a result roses, carnations, daffodils and other flowers were sold at prices that must seem ridiculous when one stops to think of them. Roses were the principal feature in the slaughter, some very fair stock being disposed of at 25 cents a dozen. American Beauties were sold in a dry goods establishment at 10 cents each uniformly—short or long stems—and there was some very good long-stemmed stock in the lot, too.

More than one establishment sold roses at from 25 to 50 cents. Others who did not have these to burn got up conflagrations of their own with carnations at 15 and 20 cents per dozen, and daffodils and tulips at 25 cents, so that all around there was a real hot time in the old town last week in spite of the rather chilly natural atmosphere.

Well, every year has seen a similar outbreak for some time back, and possibly we shall continue to have the same sweetly pleasant situation every year in the future until florists learn that while there may be a real pleasure in these little eccentricities, there is little money in it, more especially as the public is thereby led to form very erroneous opinions as to the figure at which flowers can fairly be sold, and is very slow to forget these good times that are occasionally provided by the all too generous florist solely out of the goodness of his heart and the praiseworthy ambition to "do" his competitors. NEMO.

PITTSBURG.

Business Fair.

Business for the past week has been very fair and promises to continue in this state. The war excitement does not seem to have any perceptible influence on social doings. Receptions, weddings, banquets and other social functions continue with their usual regularity. There seems to be a surplus of roses and the prices are accordingly exceedingly low. The weather is unfavorable for the sale of a large amount of bedding plants. The growers anticipate an unusually large demand for Decoration day, due to the newly awakened patriotism.

Notes.

Messrs. Elliott & Ulam, of Pittsburg, Pa., will furnish the decorations for the Americus Club banquet April 28.

At the last meeting of the Pittsburg and Allegheny Florists' and Gardeners' Club two new members were elected: Messrs. M. Nauman and Frank Hayman. Plans will be formulated at the next meeting for a general fall flower show. Many members will look forward to a grand banquet this club intends giving in the near future.

F. Britenbaugh & Bro. report a large sale of their Little Beauty and Lord Byron fuchsias.

F. J. Curtis, of Ben Avon, Pa., is sending out a neat announcement of bedding plants.

Arbor day, last Friday, April 22, was observed here only in an informal way. T. P. L.

BUFFALO.

Business Somewhat Slow.

There has been a low pressure of the atmosphere for the past week, and business can be described as precisely the same; no elaborate weddings or parties that demanded anything extra, simply a steady, quiet demand. Yet there does not seem any over-supply. Violets are still coming in in quite good quality and sell freely at the popular price of $1.00 per hundred. Carnations of good grade all go, and there are not enough. It seems to me the man who has taken care of his carnations, and will for the next three months pick many thousands of fine blooms, has a rich reward to come. Relatively low in price they may be, yet the great demand and prolific crops make them highly profitable. The expense of growing them is over, and nothing but watering, fumigating and the delightful occupation of plucking them remains; so to neglect them now or pull them out to make room for a crop of bedding plants is very short-sighted; your profit is just to come. In another week we will have outside daffies and early tulips to relieve the scarcity of cheap flowers, so welcome for our cemetery trade, which some of us have not yet been able to dispense with. We are not all yet Fifth Avenue florists.

We expect to have an unusual call for sweet and lasting flowers this week. When our ten regiments of the national guard take the train for the seat of war, poor lads and lassies ere they part will want some little exchange of tokens. A spray of Myosotis palustris will fill the bill. Poor chappies, when wading through the swamps of the Pearl of the Antilles they will doubtless be glad to exchange their withered blossom for a hamburger sandwich, but we hope patriotism and sentiment (even if rations are short) will buoy them up under all trials.

Business Changes.

There is more than the ordinary amount of moving among the craft. The smudge of fire and smoke quickly moved S. A. Anderson, and he is already installed in his new store, 440 Main street. It is a most commodious and commanding position and what may be called the very center of the city. With his tact, theological associations, native shrewdness and unlimited resources from Uncle, nothing but success can look this young man in the face.

W. A. Adams hops across the street to occupy the store so long the down town depot of Wm. Scott, where he is bound to bring all his own friends and we hope many new ones.

"P. Scott and father" will go up town a few blocks (546 Main street) to a larger place, where increased rent and much increased facilities are expected to result in sufficient increase in revenue to warrant progress.

Allow me, Mr. Editor to say that our town is getting sufficiently full of retail florists, almost too full, but no matter where you go or in what block you are every one has their friends and no one man can do all the business. The leading man will be he who keeps the best article, is most polite and attentive to his customers, prompt in delivery and fully gains the confidence of the public. But in spite of all these desirable essentials there will be lots of business unknown to this leading man, merely from personal reasons, and right it should be so. If it were not so there would be such Napoleons in the trade that all others would be privates and paupers.

Visitors.

After a recess of two weeks we had a tidal wave of drummers. Fortunately they all came on one day, so from breezy morn till dewy eve, and even to the still and solitary hour of midnight, did they invade our quiet precincts. In early morning came a Dutchman of most gentlemanly mien, whose card I lost; then Mr. Fotheringham, who speaks his piece for Mr. Pierson, of Tarrytown; then Mr. Blaauw, whom we have to see because he sells good axaleas. Mr. B. is a small man with a smile much larger in proportion than his body, but he means it all right and uses his affability for a laudable purpose—a sort of a torpedo catcher. As he always fills his orders faithfully, we forgive him.

A complete surprise in the way of a commercial traveler (drummer is not a good enough title) was Mr. P. N. Koster. Marvelous was the manner of this artist. "Mr. S., I did not call on you to receive orders. I merely called to get a few fine carnations for my wife, who is in Rochester." You can guess we sunk to the floor, not with fright, but with an overpowering sense of something mysterious.

Then who should come along, away after dark, but Mr, Ponderosa Burt Eddy. There is nothing exactly like him, certainly not in our trade. We all know him as a comedian. We did not know him as a scrapper, but now know he was. If J. C. Vaughan could divide Burt Eddy into five parts, each containing Burt Eddy mentally; what a blessing it would be for J. C. But then, Burt, without his ponderous ponderosity, would not be B. E., and so the problem ends. The enormous but agile conglomeration, the mobile expansive features that mould themselves readily into any form of grief or joy, expectation or despondency, are gifts not bestowed on every man, and God forbid they should be, for then there would be no fun in it. In his subdued conversation he discharges at his victim a continuous flow of apt remarks, illustrated and enlightened by genuine Americanisms, the brightest and best wit of the world up to date. W. S.

BOSTON.

Trade Conditions.

The majority of the growers in this vicinity are now heels over head in work, preparing for a heavy spring season, and only show up in the market about once a week, and as the most of them are obliged to throw out their flowering stock to make room for spring plants, it to a certain extent influences the cut flower market.

During the early part of the week the demand and the supply were about equal on such staples as carnations and roses, but when Saturday came so came the growers also. Result was that prices on everything dropped. Carnations of a strictly first quality brought from $3 to $5 per hundred, the latter price being paid for Flora Hill, which are in limited quantity in this market.

The spring crops of Mrs. Fisher and Scott are now coming on and will have a tendency to bring down prices to a warm weather basis and will give the fakirs a chance; they have been out of the carnation market since before Easter. Roses, the common varieties, have taken a decided drop. Beauties are not plentiful, but enough to supply the demand, being helped out by some very fine Brunners.

Violets have been superseded by the Mayflowers, which are plentiful and of fine quality. There are lots of sweet peas and pansies in the market, selling fairly well. Lilies and bulb stuff is very slow and requires lots of forcing to sell it at all.

News Items.

It is rumored that F. W. Fletcher, who has just resigned his position as managing editor of the N. E. Florist, is about to go to the front as war correspondent for a local daily.

Spring auctions have now got started in good shape. N. F. McCarthy is selling three times a week, mostly hardy stock from Holland, and has been averaging from $7 to $8 for budded roses, other stock in proportion.

The war scare is causing some anxiety among growers of spring plants, especially among those that have their establishments at or near the beaches. The exodus of city people will probably be to the mountains this year.

Seedsmen report business as good, fully equal to a year ago.

Weather cold and backward. P.

TORONTO.

Signs of Spring.

Spring is allowing itself both to be felt and seen now. The weather having been quite mild and balmy, with good rain lately, trees and shrubs and herbaceous plants are pushing ahead at a great rate. The parks are looking very pretty now, with the bulbs all in bloom and the grass so vividly green. Probably spring seems a more delightful season in Canada than in many other places on account of the contrast to the long period of severe winter weather.

Cut flowers are very plentiful and of good quality now, but prices have slid away down. People are beginning to talk about plants for their gardens a good deal and there is quite a trade being done down at the market on market days.

Notes.

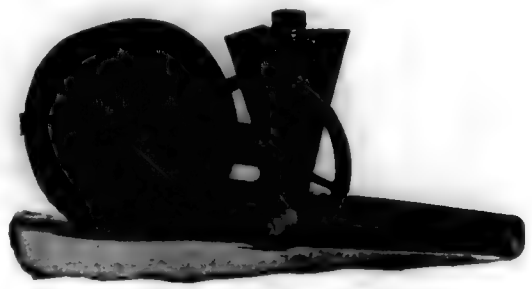
Mr. Fred Bromham, late of the exhibition park greenhouses, has decided to try his luck on the Pacific coast and will start this week. He should succeed well there, being a first-class grower of stove and green house plants.

At the May meeting of the Horticultural Society the details of the public school children's Chrysanthemum show will be gone into and a paper on "Bedding Plants" will be read by Mr. A. H. Ewing.

The prize list for the ninth annual chrysanthemum show, held by the Gardeners' and Florists' Association, has been published. Any one requiring a copy should apply to E. H. Carter, Riverdale Park, Toronto. E.

WASHINGTON.

The florists are now directing all their energy to getting their carnations and other plants in the field. The season is backward; we usually have them planted by the first of April in this section.



The retail trade has been extremely quiet, the only work done being in the funeral line. The store men say that they are doing as much business this year as was done the year before, same date. The weather has not been favorable for a good plant trade, either too cool or too wet.

During the visit of Wm. J. Bryan to this city a couple of weeks ago, he was presented by the president of the Lakeland Democratic Club with a floral design of a cross which measured four feet wide and seven and a half feet high. The center work was of Perle roses bordered with two rows of daffodils. The base represented draped American flag. The union was made of Lady Campbell violets, the stars of white azaleas, the stripes of red and white carnations. A crown of thorns made of Gleditschia triacanthos across the arm and a nine-pointed star, representing Bryan's propositions.

Mr. Bryan wrote a personal letter to Mr. Freeman, the designer, saying that he had received many floral pieces, but this was not only the prettiest but the best made piece he had ever received. W. H. K.

MILDEW IN SUMMER.

The application of sulphur to large numbers of rose plants in summer, to prevent mildew when artificial heat is discontinued and it is no longer possible to secure results by applying sulphur to the heating pipes, is quite a

MacMichael's Sulphur Blower.

serious task, and with the average bellows much of the sulphur is wasted by not reaching the desired places on the foliage.

These difficulties have been overcome by a florist of an inventive turn of mind, who has produced a blower that will do the work in much less time and more effectively. With this blower the force is so strong and steady that the sulphur is distributed with remarkable evenness and speed. It promises to be an important labor saving device for the rose grower in summer. The inventor is Mr. H. MacMichael, 956 N. Leavitt street, Chicago, who is now putting it on the market.

KANSAS CITY, MO.

Desirable Easter Trade.

For Easter, weather was all that could be desired. Two of the leading florists report 15 per cent increase. In cut flowers the demand was good and prices up to former years. No trouble to sell first-class roses, especially Gontiers and Bridesmaids. Bulb stock was plentiful and good.

In plants Harrisii was the principal article. Plants at $1 to $3 were the ones that went, fancy prices getting to be a thing of the past. Hydrangeas and hyacinths were in brisk demand, especially the latter, 25 and 35 cents each being the price. Pans with two and three dozen in each sold fairly well. Pans and pots of valleys sold well and at good prices.

There was less demand for palms and ferns. Blooming plants are what take at Easter. On account of weather, delivery of lilies was excellent, and as a result less complaining than any year since the writer has been here. One thing to be remembered is, that good stock in plants and cut flowers will always sell. Also that the popular price is $1 to $3; and with war in Cuba, would advise for next year 50 cents to $1 as the price to be most available, unless the Klondike next fall sends her tons of precious yellow metal to our shores, for this war talk is certainly affecting business.

We have had a visit from Mr. Nickelson, of the Texas Seed & Floral Co., a bright and intelligent Scotchman.

Report has it that A. Newell will become a major in the army. S.

MILWAUKEE.

Easter trade was fully 25 per cent. larger than last year. All stock sold well, with the exception of bulbous stuff. Tulips and hyacinths were sold at any price obtainable at the last day, as much of that class of stock was held back and then dumped on the market too late to dispose of the larger quantity coming in.

Harrisii lily plants found ready sale, good plants bringing at wholesale 15 cents per bud. There was also a fine lot of spiraeas, azaleas, cinerarias and mignonette plants on the market, which found ready sale.

In cut flowers, carnations led with a large and early demand, ranging in price from $2 to $4 per 100. Roses also sold well, prices ranging from $4 to $8 per 100. Smilax was scarce, selling as high as 20 cents per string, and not extra large at that figure. Weather was fine for delivering plants.

GEO. WASHINGTON.

HUNT'S REVIEW OF THE CHICAGO MARKET.

The past week failed to show the improvement we looked for, perhaps due in part to the war excitement. Prices have ruled low, the demand having been so light that only a small part of the best stock has brought fair prices, the bulk going very cheaply.

Lilac is coming irregularly and selling fairly well. Valley becoming scarce, and price considerably advanced. Within a few days, however, the out-door product should begin to appear, when price will take a drop. Paeonies are looked for within a week, and we will soon be in the midst of the usual spring supply of outdoor stock.

The main stocks, roses and carnations, have fared about alike during the last few days, there being an occasional day when the market cleaned up pretty well, followed by a day absolutely lifeless from a business standpoint.

BALTIMORE.

Business Conditions.

Business has fallen off considerably the past week, and is unusually quiet for the season of the year. Very little entertaining was done in the social world, and in what few events did take place the floral decorations were of a minor character.

Transient cut flower trade was especially poor. Summer weather has had the effect of crowding the streets with shoppers, yet the flower stores remain comparatively deserted and were little benefited.

Several prominent tourists, in expressing their views to the writer, attributed this sudden check to the "war scare." Circumstantial evidence is certainly pointing strongly towards that theory, for it is always the florist who is first affected by a depression.

Stuff is plentiful and of good quality. Violets may be considered over, though a few are still handled. Carnations are fine, and, as usual, greatly in demand. Harrisii and longiflorums are also about over, though a few relics of other Easter stuff are still to be seen. Out-of-door blooming stuff is plentiful. Valley is just coming in.

Notes.

Mr. Jno. Cook reports "an exceptionally good Easter trade; plants were more in demand than cut flowers; sold out entirely on azaleas and could have disposed of many more."

A fine carnation display was seen this week in the windows of Messrs. Halliday Bros. Many different varieties were used in the decoration, and each and every bloom was of the finest, thus doing great credit to the firm's established reputation as growers.

C. F. F.

OBITUARY.

Reinhardt Maitre.

We regret to have to report the death of Mr. R. Maitre at his home in New Orleans, La., April 14, aged 68 years. Death was due to general debility, following an illness of several months.

Mr. Maitre was the oldest florist in New Orleans, having been a leader in the trade there for forty-three years. In 1892 he partially retired, turning over his city store to Mr. U. J. Virgin, his nephew. Mr. Maitre was well known to the trade through his frequent attendance at the meetings of the Society of American Florists, in which organization he always took a lively interest. He had many friends in the trade, who will be grieved to hear of his death.

NOW in course of preparation, The Florists' Manual, by William Scott. It will cover the whole field of commercial floriculture, the articles arranged alphabetically, so that reference may be quick and easy. It will be a whole library in itself. Price only $5.00. Send in your order now to the Florists' Publishing Co., 530-535 Caxton building, Chicago.

WANT ADVERTISEMENTS.

WANTED—A good rose grower. Also a good man for orchids, ferns and palms, for commercial place. Address Minnesota, care of Florists' Review.

SITUATION WANTED- By a practical English florist and grower of No. 1 roses. Carnations, 'mums, violets a specialty. Now disengaged. Age 39. Commercial or private position. Address W., Florist, box 547, Alliance, Ohio.

FOR RENT—For greenhouse purposes, 32,700 feet on Michigan Avenue. Long lease and low rental. Room 922, 184 La Salle Street, Chicago.

SITUATION WANTED—By thoroughly practical all round gardener. Capable of taking entire charge of a gentleman's private place. Exceptional references as to character and ability. Address Gardener, care of Florists' Review, 105 Hudson Street, New York City.

SITUATION WANTED—By a competent florist and gardener, 14 years' experience in growing cut flowers, tropical plants, cyclamen, etc. Also a first class designer and decorator. Capable of taking charge of place of any extent. Age 30, single. R. S., care Florists' Review.

SITUATION WANTED—An experienced florist (of 20 years) and wife wish a situation to run a flower store or work in greenhouses as makers up of florists' designs. Best of references. Man a total abstainer. G. Y. C., care Florists' Review.

SITUATION WANTED—By young man, in retail flower store, ten years' experience. Capable to take full charge. Address W. W., care of Florists' Review, 56 Pierce Building, New York City.

WANTED—Young florist for greenhouse work; steady place for the right man. Garfield Park Floral Co., 1688 West Madison Street, Chicago.

FOR SALE—A well established flower store in one of Chicago's busiest streets at a reasonable price. Address E. Kitzinger, 867 Milwaukee Ave., Chicago.

WANTED—Good young florist for store and greenhouse. Address H. N. Bruns, 690 W. Van Buren Street, Chicago.

WANTED TO RENT—Greenhouses in good working order, by experienced grower, or will run place on shares. Writing, give particulars. C. B. A., Florists' Review.

FOR SALE—At a bargain, 4,000 feet of glass, well stocked, with seven-room dwelling, barn and stable, everything in good repair, in a fast growing city of 40,000. A fine chance for a young man with push. For particulars address E., care of Florists' Review.

SITUATION WANTED—By A1 grower of roses and other cut flowers and plants, as working foreman; has held similar positions in Chicago; best of references. Address E. C. care Florists' Review.

SITUATION WANTED—By a first-class florist; single, German. 36 years of age, with 20 years' experience in growing roses, carnations and general stock; can furnish best of references. H. C., care of Florists' Review.

SITUATION WANTED—By florist and gardener; good grower of roses, carnations, mums and general stock. Only those in need of a good man and are willing to pay fair wages need apply. Address K. K., Florists' Review.

FOR SALE—Six greenhouses, about 14,000 feet of glass; well stocked; wholesale and retail town of 4,000; no competition; less than 100 miles from Chicago; two railroads; good seed trade. For particulars address A, care Florists' Review.

WANTED—Two good greenhouse assistants; please give experience, references, etc.; wages, $9.00 per week. Address J. A. Peterson, 105 E. 4th St., Cincinnati, Ohio.

WANTED—A first-class grower who knows enough to run a place on business principles, to buy one-half interest and take full charge; must thoroughly understand the business. If dissatisfied with his purchase any time within one year he can have his money back. For particulars address A. H., care Florists' Review.

SITUATION WANTED—By expert grower of plants and cut flowers. Competent in every department. Seeks a situation where he may have a chance to make his services worth more than in his present place. Can surely advance his employer's interests if given suitable opportunity. Address S. D., care Florists' Review, Chicago.

WANTED—A working foreman, must be an A 1 rose grower, American preferred, but must be able to furnish the best of references. No fakes need apply. The plant is backed by wealth, therefore, will have none but the best. A good salary will be paid to the man who can prove his ability. In writing, send copies of recommendations and address. Address L. T., The Florists' Review.

WANTED—An industrious, energetic married man with no children. Man to work in rose and violet houses, wife as packer of cut flowers, etc. Wages, combined. $45.00 (forty-five dollars) per calendar month and two rooms free. None but those who have had experience need apply. Anchorage Rose Co., Anchorage, Ky. Chas. Rayner, Manager.

OCONOMOWOC, WIS.—Wm. Desmond has rented the Spring Bank greenhouses and several acres of land and is ready for business.

Greenhouse Woodwork

Open-air-dried Cypress Lumber is more durable, and better suited to Greenhouse conditions than kiln-dried stock. But you cannot get it from those that are engaged in the business in a small way—even though their entire business is confined to greenhouse material—for it takes a long time for the lumber to thoroughly dry and this means an investment in lumber that only those of large capital can make. The only way to have air-dried lumber is to buy green lumber and hold it until it dries. Those that order dry lumber from the producers of Cypress get kiln-dried stock. It is cheaper for them to kiln-dry than to hold the stock long enough to season it in the open air. We carry a large stock and fill all orders with open-air-dried Cypress clear of knots, sap and all other defects.

J. E. FELTHOUSEN, Schenectady, N. Y.

...CHRYSANTHEMUMS...

GREEN AND GOLD. Foliage beautifully variegated with yellow, clear and decided. Flowers very double, creamy white. A splendid exhibition plant. Worth growing for its beautiful foliage alone. 50c each; $4.00 per doz.

SUSAN B. ANTHONY. Handsome light green foliage, immense perfect flowers, like drifted snow. A grand bloomer; long-stemmed flowers. Splendid for cutting. 25c each; $15.00 per 100.

WHITE WINGS. Exquisite, large semi-double flowers. Shining white petals, very long. Beautifully incurved and curled. Grand for cut flowers. 25c each; $15.00 per 100.

MADONNA. A pure white Anemone flowered variety. Flowers of the most perfect form. Beautiful center of small florets, prettily fringed. Fine upright habit. Flowers on long stems. 25c each; $2.00 per doz.

These varieties are early and medium bloomers.

OTTAWA, ONT.

Graham Bros. report a bang up Easter, and a good seed business. Spring plant trade is looking up, and as the Dominion intends offering special attractions this season to the tourist, plant decorations will be in greater demand.

Chas. Scrim had an eye to this when he fitted up his new store, which is a dazzler, the loftiest and most convenient in the east. Here the veteran decorator, E. I. Mepstead, gets in his work by giving illustrations of artistic decorating, which can only be done in a large store with abundant stock, such as is raised at the greenhouses, which I never saw in better shape than at this present time, showing that whilst Edward was many years a store artist, he has not lost sight of the early training received at the potting bench. W. M.

SPECIAL PREMIUMS.

We have received from the American Jadoo Company, Philadelphia, a printed list of special premiums offered by them for plants winning first prizes at the fall exhibition of the Pennsylvania Horticultural Society next November. They offer seventy-one special premiums, amounting to the neat sum of $314.00. These are in addition to the regular prizes offered in the official list of the society. The conditions under which these special premiums are offered are that the plants, flowers or vegetables must be scheduled first or highest prize-winners in their respective class, and that they must have been grown in Jadoo Fibre or watered with Jadoo Liquid. A copy of the list can be had on application to the American Jadoo Company, 817 Fairmount avenue, Philadelphia, Pa.

LORD & BURNHAM CO., of Irvington-on-Hudson, N. Y., will move their New York office on May 1 to the St. James building, Broadway and Twenty-sixth street. Their new city quarters give them increased office room, besides show rooms, where they will shortly exhibit samples of their greenhouse construction, greenhouse heaters, ventilating machinery, and other manufactures.

WATERTOWN, N. Y.—Green & Underhill are very sanguine as to the future. Up to the present it has been the best spring for many seasons. The large quantity of stock moved by these enterprising gentlemen is very gratifying.

VAUGHAN, McKELLAR & WINTERSON, 45, 47 and 49 WABASH AVENUE, **CHICAGO.**

MONTREAL, QUEBEC.

Easter was most satisfactory, both in weather and business. All who had good stocks cleared out at usual prices, which were a slight advance over ordinary. St. George's Day (24th) created a big demand for roses, the appropriate flower for this event.

S. S. Bain intends making a European tour, during which time he will secure notes for his weekly contribution in the gardening column of a local paper.

Jos. Bennett has removed to 136 Peel street, where he has a handsome store, with conservatory in rear, one of the most convenient places we know of.

Wilshire Bros. are taking a more convenient store to handle their increasing business with greater facility.

B. T. Graves has given up his down-town store for the season and concentrated his forces at the houses, where he turns out a fine stock of bedding plants at this season.

P. McKenna & Son are among the largest growers. In carnations, Daybreak and the but little grown Silver Spray are the two best kinds here.

J. S. Murray maintains his reputation for well-grown stock, which is handled to the best advantage at his down-town store by Miss Murray.

Walt Wilshire grows roses extensively, and at Lachine Colin Campbell, and Jos. Bennett, have made quite a reputation. Mr. Bennett has been bothered with the eel worm, and will try grafted stock, in the endeavor to overcome the pest. His other stock shows the result of careful attention.

CINCINNATI.

Cincinnati Florists' Society.

The regular monthly meeting of the Cincinnati Florists' Society was held the evening of April 16. The display of plants and cut flowers was as usual a magnificent one.

H. Weber & Son, of Oakland, Md., and Wm. Swayne, of Kennett Square, Pa., were out of town exhibitors.

A. Sunderbruch's Sons made a gorgeous display of tulips, having forty varieties of same. In addition to their cut flowers they had a fine collection of foliage plants, such as palms, Pandanus Veitchii and adiantums. They received the largest number of points and are in the lead for first prize.

R. J. Murphy staged a vase of Jacques which were well grown.

George & Allen did not have so large a display as usual, but what they did exhibit was A No. 1, especially their Beauties.

H. Weber & Sons showed a grand collection of fancy carnations, notable among them being Flora Hill, Uncle John, Della Fox, Buttercup and Daybreak. They received special mention on their new rose, Mrs. Robert Garrett, which came in excellent condition.

R. Witterstaetter was on hand with a vase of crimson seedlings that were simply superb; also a vase each of Pres. Sunderbruch and Opal.

Wm. Swayne sent a vase of Empress which was greatly admired. It is the largest crimson carnation yet introduced and will undoubtedly become a popular commercial variety.

No business of importance was transacted at the meeting. The proposed banquet was discussed and the secretary, Henry Schwarz, was instructed to ascertain how many desired to feast at $1 per cover.

The next and last exhibition for this season will be held on Saturday, May 14. B.

THE OMAHA EXPOSITION.

Ten states have applied for space at the Trans-Mississippi and International Exposition, and all will have exhibits as fine as ever shown at any exposition.

The grounds will be well supplied with floral exhibits, as more than a score of the largest florists in the United States are sending some of their best material for use there.

A splendid aquatic pond is being constructed, in which will be grown three Victoria Regias and many other of the finest aquatic plants. This exhibit is made by Henry A. Dreer. Heat will be supplied by means of hot water, and the best conditions possible will be provided in order to make this a particularly good feature.

F. R. Pierson Co., Tarrytown, N. Y., will duplicate the magnificent display of cannas they made at the Tennessee Centennial in Nashville.

W. Atlee Burpee & Co., Philadelphia, will show the Burbank rose and Gloriosa cannas. W. W. Wilmore, Denver, Colo., will exhibit a set of his fine dahlias.

A very interesting exhibit will be that of the Sunset Seed and Plant Co., San Francisco, who will have a bed containing 162 varieties of sweet peas. A Blanc & Co., Philadelphia, will supply fine exhibits of cannas and cacti.

COLUMBUS, O.

There was a greatly increased demand for cut flowers at Easter. Prices about the same as last year, but were kept a trifle stiffer, and practically everyone cleaned out nicely. On Easter lilies the price was about 30 per cent. higher than last year. Some florists on the outskirts of the city cut their profits by selling lilies at 50 to 75 cents a pot, when there was no good reason to make such a low rate; still there was not so much price-cutting as last year. F. D.

THE Gurney Heater Mfg. Co., Boston, Mass., issued a very novel Easter souvenir. On opening the folder it was found to contain a life-like representation of the purple fruit of an egg-plant, inside of which was a small packet of egg-plant seed. The recipient is requested to plant tne seed and raise a commemorative egg-plant.

MR. A. LANGE, Chicago, has sent us a neatly printed pamphlet entitled, "The Language of Flowers," which he is presenting to customers as a souvenir. It is a very pretty adv. for a retail florist.

RICHMOND, VA.—The stock of the Richmond Floral Company was sold at auction April 15 to close the business.

IF YOU HAVE anything to sell to the trade, offer it in an adv. in The Review.

Facts more eloquent than words,
C. S. A. awards highest of the year.
New York 95 points.
Boston 94 points.
Chicago 93 points.
Philadelphia 89 points.
First prize, white, in strong competition at Boston and Philadelphia shows, and certificated wherever shown.
The ideal commercial and exhibition bloom.
Price, 50 cents each, $3.00 per dozen, $20.00 per hundred, $150.00 per thousand.
Ready for delivery March 1st, 1898.

The Model Extension Carnation Support

QUEENS, N. Y., Feb. 16, '97.
MR. THERON PARKER. Brooklyn, N.Y. Dear Sir:—I have tested your latest Model Carnation Support, and am free to say that I consider it the best wire carnation support that I have ever seen. It is quickly and easily applied, and I think will prove very durable, and you certainly deserve great credit for the invention.
Very truly yours, C. W. WARD.

FLATBUSH, BROOKLYN, N. Y., Feb. 18, '97.
MR. THERON PARKER.
Dear Sir:—Your wire stake is certainly a gem. Without hesitating we endorse it as an up-to-date Carnation Support. Yours truly, DAILLEDOUZE BROS.

W. HOBOKEN, N. J., Feb. 18, '97.
MR. THERON PARKER, Brooklyn, N. Y. Dear Sir:—It gives me much pleasure to congratulate you upon your success in getting up Carnation Supports. I think that those I have had from you are about as perfect as anybody will be able to make them. They certainly fill my bill for an ideal carnation support, a thing I have been looking for for a long time. Wishing you every success in the sale of them, I am, Yours truly, E. ASMUS.

MADISON, N. J.

Club Notes.

The members of Morris County Gardeners' and Florists' Society were out in full force at its regular meeting on Wednesday night. President Duckham in the chair wears the harness as a veteran and all goes as merrily as marriage bells. The society secured some valued acquisitions to its fast growing body of membership by the election of Messrs. C. A. Work and H. Hentz. W. Whalen and D. Falconer were also elected.

The co-operative purchasing scheme is making substantial progress in the hands of its committee, and a full report thereon was promised for next meeting.

John Jones exhibited some fine Brunners and J. Davies brought a magnificent calceolaria; the plant large and well flowered, though only in a 5-inch pot.

The competitions, as arranged for at the monthly meetings promise to give an impetus to the society's work, and a committee was appointed specially to develop this new feature.

The essayist of the evening was Mr. A. Herrington, who gave a long and most interesting talk on "Insectivorous Plants," his remarks being well illustrated with specimens of droseras, nepenthes and sarracenias, besides large drawings showing the different processes by which all these plants attain the same desired end, that of obtaining the essential nitrogen for their sustenance.

We give elsewhere a more detailed notice of the subject. "Tell it not in Gath," but set it down to the gory nature of the evening's talk for the rumors of a hot "mix up" are well founded, and not till the evening train of the following day did one of our visitors depart after having finally located and secured his Knox (size 7½), while the others have yet to be heard from.

WE HAVE RECEIVED from the Pierce, Butler & Pierce Mfg. Co., Syracuse, N. Y., a copy of their latest pamphlets regarding radiators and valves. It is very handsomely illustrated and printed. This firm is the maker of the well known Spence hot water heater.

WHENEVER you need any trade supplies not offered in our advertising columns, write us about it. We will place you in communication with some one who can supply what you want.

BUY YOUR supplies from the advertisers in The Florists' Review, and thereby increase the earnings of your certificate.

Extra select stock at Kennicott Bros. Co., Chicago. All flowers in season at lowest market rates.

Last Call For Field-Grown Roses!

ORDER BEFORE IT IS TOO LATE.

We still have to offer an exceptionally fine lot of

HYBRID PERPETUAL ROSES,

extra strong field-grown plants of the very finest sorts, such as **Mrs. John Laing, Ulrich Brunner, Mme. Gabrielle Luizet, Paul Neyron, Magna Charta, Gloire de Paris, Baroness de Rothschild, Gen. Jacqueminot, etc.** This is fine stock for potting for late spring sales or for out-door planting—fine strong blooming stock. We offer it as long as unsold at **$12.00 per 100.**

We have to offer also, a magnificent lot of

YELLOW RAMBLER ROSES,

strong dormant plants, 3½-inch pots, **$10. per 100;** 5-inch pots or strong field-grown plants, **$20.00 per 100.**

We offer also fine strong field-grown plants of

CRIMSON, WHITE AND PINK RAMBLERS,

at same price as Yellow Rambler.

We have a large stock of extra strong field-grown plants of **CLEMATIS**—finest sorts—**Mme. Ed. Andre, Jackmanii, Henryii,** and **Hybrida Sieboldii. Price, $30.00 per 100.**

CLEMATIS PANICULATA—extra strong field-grown plants, **$15.00 per 100.**

THE FLORISTS' REVIEW.

Always mention the **Florists' Review** when writing advertisers.

WHEELING, W. VA.

Easter trade this year increased 40 per cent. over last year. There were heavy calls for cut flowers, not enough to supply the demand, especially carnations and violets. Roses were handled in fine quality and large quantity and sold readily at $2.50 to $4.00. Beauties sold as high as $10 per dozen. Carnations brought 75 cents to $1.00 per dozen.

Easter lilies all sold out at noon Saturday. Palms and other plants also sold well. A few fine azaleas were handled by the Huscroft Bros., and sold at excellent prices. The florists all around seem to be well satisfied with their Easter trade.

Wm. F. Kasting, of Buffalo, N. Y., spent a couple of days with Huscroft Bros., and showed some fine Genesee carnations. It is an excellent white, and hope it will do as well with us this coming season. All the florists here are going to try it. H.

LOUISVILLE, KY.

Easter trade in Louisville was good, all the retail stores selling out clean. Mr. Jacob Schulz had a large trade in bulbous stuff. Mr. Fred Haupt had one of the best decorated stores in town.

Mr. Ed. Reimer reports a large business at his store near Cave Hill, selling quantities of lilies, hyacinths and tulips. Mr. J. E. Marrett also had a large quantity of cut flowers in fine condition.

Rain on Easter Sunday from 11 a. m. until night kept people from visiting the cemeteries and damaged the business of those florists in their vicinity.

KY.

SMILAX.

According to M. Georges Truffaut, in the French Revue Horticole, Myrsiphyllum asparagoides (smilax) contains a larger percentage of nitrogen than any other plant he has examined. It is also rich in chlorine and sulphuric acid. M. Truffaut accordingly recommends the application of a fertilizer containing a mixture of sulphate of ammonia, nitrate of soda and ammonia hydrochlorate (the proportions are not stated), and applied in solution at the rate of two grammes per liter. In subsequent years, phosphoric acid and sulphate of potash may advantageously be added to the nitrogenous manure.

SEND IN your order now for a copy of The Florists' Manual, by William Scott. It will cover the whole field of commercial floriculture and will be the standard work of reference for the trade. Price $5.00.

Do You Know

that prominent growers and florists have achieved very satisfactory results by the use of JADOO FIBRE and LIQUID on the plants you are now most interested in.

Chrysanthemums Gloxinias
Begonias Carnations

?

....HERE IS WHAT THEY SAY....

THE PENNROCK CO.
Wilmington, Del.

"In regard to your inquiry about Jadoo Liquid and Fibre we beg to state that we used it this last season with good results. We grew our exhibition plants of Chrysanthemums, which took first prize at the Pennsylvania show, in soil up to ten-inch pots. In those sized pots the plants became very sick and all the leaves turned yellow. We then shifted them into Jadoo Fibre, and the result was simply wonderful. The plants quickly regained lost vigor and the leaves gradually assumed their natural green color. On becoming pot-bound, we used the Liquid twice a week, and this was all the fertilizer we used. We have had excellent results also with Asparagus Sprengerii, Crotons and large Ferns grown in the Fibre, and shall use it more extensively hereafter."

JAMES S. REID,
Philadelphia, Pa.

"Throughout the past winter and spring I used Jadoo for our Hydrangeas, Begonias, both tuberous and fibrous rooted, Gloxinias, Crotons, Geraniums, Fuchsias, Ficus, Pandanus, Lilies, Roses, Carnations, and the host of other plants usually grown by the commercial florist, and it proved all that was claimed for it by the introducer; the plants grown in Jadoo being uniformly superior to those grown in ordinary loam."

GEO. MIDDLETON,
Wyncote, Pa.

"I have been using Jadoo for several months with great success. Some of my Chrysanthemums which won first prizes at the exhibition of the Pennsylvania Horticultural Society last November were grown in Jadoo Fibre, and I noticed that the foliage was much darker than in the others, and clean to the bottom. My single bloom Chrysanthemums are grown in four-inch pots and measure six inches from tip to tip."

E. T. DENHAM,
Gloversville, N. Y.

"I have potted a choice lot of seedling Chrysanthemums in the Fibre and they are doing splendidly. The Geranium Cuttings struck very quickly—in fact, I am satisfied that it is a very good thing for florists."

C. W. EICHLING,
New Orleans, La.

"The prize-winning Gloxinias, watered with the Liquid, were the finest ever exhibited here."

ALEXANDER MACLELLAN,
Newport, R. I.

"Tuberous Begonias, which with me usually take twenty-one days to germinate, were sprouted in eight days."

A. M. HERR,
Lancaster, Pa.

"I have experimented in a small way with Jadoo Fibre for propagating Carnations, and find that with ordinary care they root one hundred per cent. Next season I shall use it almost exclusively for propagating my Carnations."

LATE CUTTINGS.

"Any good strong grower, such as Flora Hill, Triumph, Armazindy, etc., will make plants sufficiently large for planting in from well-rooted cuttings direct from the sand as late as May first. They should be planted in good rich soil, and to make assurance doubly sure, I would recommend the following: Get some Jadoo Fibre, mix it up with water to form a sort of mush, then let one man go ahead with a hoe, clipping out a hole where you intend planting; then a second man follow with a bucket of this mixture, dropping a handful in each hole, then a third to follow with the plants (dashing a half inch or so of soil over the Jadoo), and then planting the Carnation Cuttings into it. This will give the Cutting a chance to start without wilting, no matter what the state of the weather. The Jadoo will give them just enough help to make fine plants in the fall."

Vol. 1. CHICAGO AND NEW YORK, MAY 5, 1898. No. 23.

BEDDING PLANTS.

[Read before the Chicago Florists' Club, April 28, by Mr. C. J. Stromback, head gardener of Lincoln Park.]

I have been requested to prepare a paper on bedding plants for this meeting. The subject, I think, has been pretty well thrashed out already, but as you wish me to say something, I will state what plants we use for bedding in Lincoln Park.

For early spring effect tulips, hyacinths and crocus are planted the fall previous, in fields of separate colors or in mixture. The effect is good and pleases the general public for a couple of weeks. Pansies are also in bloom at the same time. I sow the seed at Christmas, grow them along all winter, and by doing so I get them to endure the heat better than the fall sown plants, which are more slender and wiry, and so cannot stand the hot weather as well as those grown in the winter. After tulips are ripened off they are taken up and stored away, the beds are manured, dug and planted with geraniums of varieties suitable for bedding. Our leading varieties are: Mrs. E. G. Hill, salmon pink; La Favorite, double white; Bruant, scarlet; Rev. W. Atkinson, dark velvety scarlet; Invincible, semi-double crimson.

Ageratum Cope's Pet blooms all summer if not given too rich soil or too much water. Begonias are valuable as bedding plants; they will bloom from spring till fall if fairly strong at planting-out time. The treatment of the begonias was described in the Florists' Review this winter. Torenia Fournieri is also a good bedder, and if not sown too early—say middle of March—will bloom till frost. Its pretty violet purple, pansy-like flowers, marked with yellow in the throat, are by some persons called "Johnny-Jump-Ups."

Pentstemon campanulatus varieties are effective for bedding. They are grown from seed or propagated from cuttings; fairly strong plants in 3-inch pots will bloom early and continue till frost; the roots can then be taken up, trimmed back and the plants kept in a temperature of 55 or 60 degrees through the winter, when the plants can be again used for bedding. Vinca alba, Vinca alba-oculata and Vinca rosea are elegant bedders; they flower all summer and have grand dark-glossy foliage, making a fine contrast with the flowers.

Ten-weeks stocks are good for early bedding, if well grown. We sow the seed in the latter part of January, prick out in boxes when big enough to handle, plant in 2½-inch pots after fourth or fifth leaf appears, in sandy loam. When well rooted in this, pot up in 3-inch pots to remain till planting-out time. As soon as flower buds appear we can select the double ones to be planted out. They make a grand show till the middle of July, when they must be replaced by Celosia cristata nana, which are in 4-inch pots at that time and remain in good condition till fall.

Single petunias of good varieties are

View in the store of Mr. W. J. Smyth, Chicago, at Easter.

useful for bedding, as they give a profusion of flowers all summer. Gomphrena globosa is valuable for its heads of brilliant and enduring tints. Phlox Drummondii, if sown in April, will bloom till fall, but if sown earlier it will lose its vitality in the latter part of August and must be replaced by something else. Verbenas have been used in park bedding to good advantage in years past, but for the last few years in the latter part of August they became mildewed, which injured the effect of the garden.

Cannas are used to a great extent here and produce a brilliant effect with both flowers and foliage. I have forty varieties, but the most prominent at present are: Egandale, Chicago, Florence Vaughan, Stella Kanst, Madame Crozy, Souvenir d'Anton Crozy and Queen Charlotte. All of these are, as you all know, great acquisitions to the flower garden, because of their great blooming effect. Carpet bedding is still retained to some extent to please the general public, but we draw a little away from it each year.

A great many annuals that I used to grow for bedding in the Old World are not of much use in this climate, as their duration is short when hot weather sets in, and we must try to keep our beds in presentable condition all summer, without too much labor. There is no doubt in my mind that our flower garden and bedding will receive some of our most beautiful perennials in time, but we go a little slow, because if we go too fast we may be condemned by the public as it has become accustomed to the present system or fashion.

Now, gentlemen, I think I have said enough about bedding in our park, as the subject has been pretty thoroughly written up in the Florists' Review.

In the discussion that followed Mr. Stromback was asked as to his experience with crotons for bedding. He replied that they had not proved satisfactory with him. They could not be planted out till the middle of June, and those he had tried did not color well outside.

He was also asked how he got such superb growth on the plants in the numerous large rustic stands that are a feature of the park. He replied that he filled the stands with good potting soil and then added a 5-inch pot full of bone meal to each. He had formerly used horn shavings, and with them he secured a quicker effect, but the bone meal was more lasting and carried the plants well through the season. Asked if he used any drainage, he replied no. That the difficulty was to supply sufficient moisture. He spoke of the plants used in filling the stands and mentioned especially Calceolaria annua as a plant that he used with excellent effect and had not noticed so used elsewhere.

Another question was as to feeding hardy water lilies. He answered that where new soil was not given he placed over the surface a layer of bone meal about an inch thick, and this was dug into the soil. They are very strong feeders.

Mr. Stollery spoke of difficulty with the Bruant type of geraniums, the plants growing vigorously but failing to bloom. Mr. Palinsky had noted the same trouble. No one was able to offer an explanation or a remedy. Mr. Stromback has had trouble from the devastations of a white worm that enters the stem of the geraniums when bedded out and eats out the heart of the stem, eventually killing the plant, but knew of no sure remedy.

Mr. Stromback has his pansies and daisies already bedded, and the next beds to be planted will be of Portia carnations. He finds Portia a good bedder, the color being bright, flowers freely produced, and habit such as to require no staking. He propagates in November and the plants will be bedded out from 3-inch pots. He does not care for the Margaret type of carnation for bedding. The flowers are not good enough; they have no fragrance and the growth is too rank. In the case of carnations, they should never be planted twice in the same soil, or results will be unsatisfactory.

He will soon plant a few beds of ten-week stocks. Referring further to the culture of these, when the seed is sown he keeps the flats in a temperature of 60 degrees, but when the little seedlings are pricked out he places them in a temperature of 50 degrees, and are kept in this temperature as nearly as possible till planting-out time. They must be sparingly watered, for if overwatered they will be affected with club root. Cheap seed of this plant is a very poor investment, as the percentage of single-flowered plants will be large. Even with the best seed there will be from 25 to 30 per cent. of single flowers, and the poorest grades will be nearly all single and worthless. The singles can be sorted out from the doubles and thrown away as soon as the flower buds begin to show. Pluck a bud and place it between the teeth. If, when you close your teeth, it is like biting into soft bread, the flower is a double one, but if it is as though the bud contained some gritty sand, the flower is single. What makes the gritty sensation is the embryo stamens, which are absent in the double flowers. Mr. Stromback finds this test absolutely reliable, and throws out at once all plants whose buds are gritty when crushed by the teeth. The seed can be had true to color and he generally plants his beds in rows of red, white and blue-flowered plants. The plants begin blooming the latter part of May and continue in bloom till the beginning of July. He then plants the beds with celosias among coleuses, the whole bordered with Cineraria maritima candidissima.

Verbenas are planted soon after the stocks. He doesn't use many now, as he has much trouble from mildew. He uses seedlings only, as plants from cuttings are sure to be rusty. He uses several beds of single-flowered petunias and they make a good show all summer. He puts out the general run of bedding plants about May 20. Cannas are bedded about June 1.

He has tried Cannas Italia, Austria and Burbank, but considers them valueless for bedding here. The flowers are beautiful when first seen in the morning, but on a bright, sunny day are all bleached out by 2 p. m. He considers Austria the best of the three and will retain a few plants of it for variety, but will not attempt to use it in bedding.

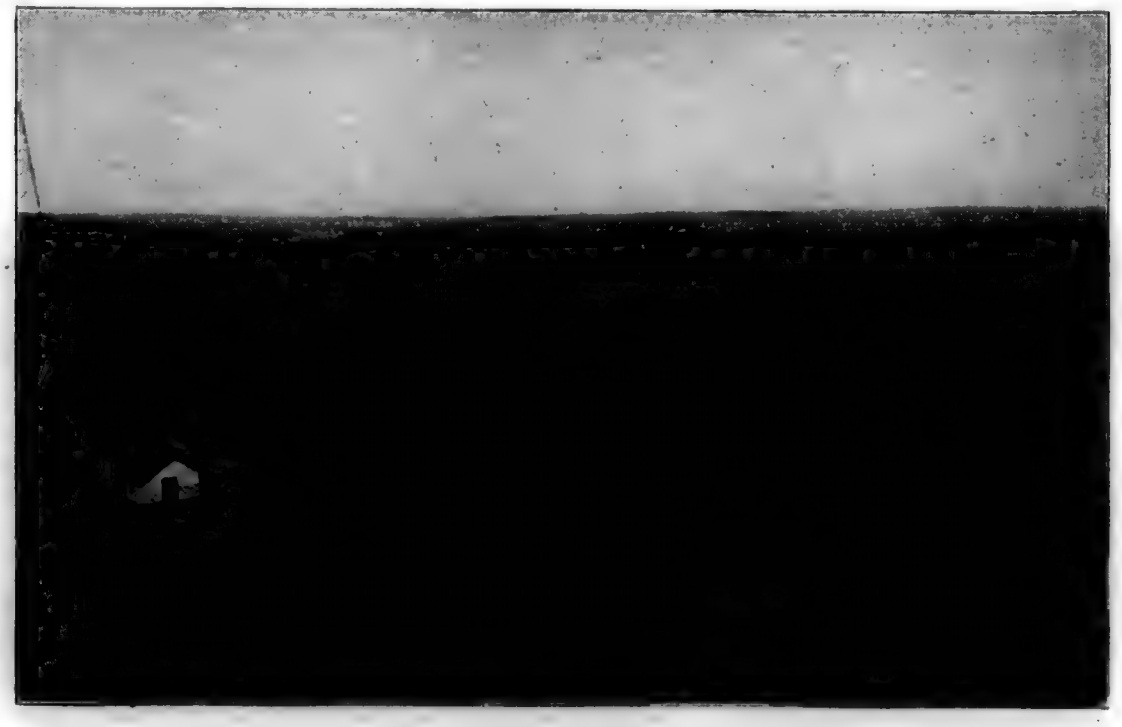
A GEORGIA NURSERY.

Favored with glorious weather, I paid a visit to the famous Fruitland Nurseries of Mr. P. J. Berckmans, Augusta, Ga., who, by the way, has recently incorporated the business, associating with himself as president his three sons, who have been connected with the business for several years.

Approaching the main entrance, one passes through an avenue of magnificent specimens of Magnolias gloriosa, ferruginia and varieties, forming a drive one-fifth of a mile in length, at the end of which is seen the residence of the proprietors, guarded by a splendid Cedrus Deodara standing alone and erect upon the lawn. On either side are noble examples of Ilex opaca, some 30 feet high, and Libocedrus decurrens. Arriving at the office, attached to and connected with the residence by telephone, which is the means of communication with the principal points on the four hundred acres of nursery grounds, I alighted, and, placing my Arabian steed in charge of a sable attendant, was not long in finding the genial senior member of the firm, who had just returned from a tour of Florida and was chock full of Irish stories and plant lore.

Deliberation and thorough system being the order of the day in this establishment, I will endeavor to follow suit in penning these notes, commencing at the houses, which I observed had all been recently raised to give more head room, and with undoubted benefit to the plants contained therein. It is almost incredible the extraordinary growth of many plants in one season, almost as if by magic. For instance, I saw a plant of Bougainvillea Sanderiana planted in a bed in the house which one year's growth had carried through a ventilator and out onto the roof, where it had spread and flowered profusely. Referring to the vigor of this plant, Mr. Berckmans said he had noted a specimen at Palm Beach, Fla., only eight months old, which was three feet through and bore at least a thousand blossoms.

Every species of palm that will thrive in the south is grown, Indian azaleas and camellias in large numbers, some dozen varieties of the orange all grafted upon the Limonium trifoliatum, which, in addition to being an excellent stock to graft the orange upon, makes a splendid hedge



plant, through which it is impossible to make a break. Another is Ligustrum amurense, which is far superior to L. ovalifolium, in that while the latter takes on a brownish tint in winter, L. amurense retains its vivid green color; it is also a much more rapid and compact grower.

Gardenia florida and Olea fragrans are raised in quantity, but there are not enough to meet the demand for these favorites. These are located in frames, in which are also some two hundred thousand privet cuttings, and tea roses by the ten thousand. A large area is devoted to a trial ground, where the many new plants annually imported are tested as to their adaptability to this climate before sending out. The land is rolling and embraces several kinds of soil, from sandy loam with a red subsoil to black peat in bottoms, where, under the protection afforded by pine belts, such plants as azaleas, rhododendrons, camellias, the more tender sub-tropical plants and many kinds of conifers are sheltered.

Evergreen shrubs form one of the most important items at this establishment, one acre being alone planted with conifers from 2½-inch pots; 25,000 of the pretty Biota nana and the newer Biota filiformis japonica (Veitch) are at the head of the long procession of this interesting class. Owing to the nature of the soil, aided by a high state of cultivation, roses and fruits attain in one season wonderful growth, both in root and branch. Vast numbers of both are grown. I can easily imagine that to see the roses in bloom and to sample the luscious fruit in season is a delight to be long remembered. Of the long list of roses, one that is particularly superb as a hedge plant is the polyantha Marie Favie. It is almost as strong as the brier and quite as fragrant. I noted a grand orchard of pears, maintained chiefly for grafts, but at the same time yielding profitable crops of fruit. Kieffer, Le Conte and Bartlett were the leaders. In ornamental plants I noted especially the rare red-flowering yucca (Hesperalaea yuccafolia), and Osmanthus ilicifolius, a beautiful shrub bearing pure white blossoms when in bloom.

Commenting upon the season, Mr. Berckmans said it has been the best in the history of the house. Two gangs of packers were kept busy night and day to handle the heavy orders. The shipping and office arrangements are most complete in every detail.

I cannot pass without noticing a substantial part of the establishment, the six brothers Skinner, none of whom is less than six feet tall, and one almost seven feet. They are an apt illustration of the productiveness of the soil, and may well be termed the six of spades, each being a knight of that useful tool. The heavy work, however, is done by machines, thus effecting a great saving in labor. The help is comfortably quartered on the estate, their domiciles, dotted here and there, being quite picturesque.

Looking South.

Looking East.

FRUITLAND NURSERIES, AUGUSTA, GA.

An abundant supply of water is obtained from a series of springs. As I stood upon one of the magnificent bluffs and surveyed the superb surrounding country, with the hills of South Carolina looming up in the distance, I could but admire the sagacity and foresight of the hospitable head of the firm in selecting such an ideal spot in which to carry on an immense and flourishing business. W. M.

NOTES FROM A GEORGIA NURSERY.

Magnolia Grandiflora—This type has many forms, amongst the most conspicuous of which are the following:

Gloriosa—Flowers of immense size, frequently 12 inches in diameter, and usually with three more petals than the type; foliage very large and stocky.

Ferruginia — So called from the brown, rusty undersurface of the leaves; flowers with rounded petals, of medium size.

Oxoniensis—Flowers very large.

De La Gollissoniere, or Nannetensis — Very large flowers, sometimes with an extra row of petals.

The above varieties must all be propagated by grafting in order to have them true, as they sport from seed. Grafted plants usually bear flowers when two to three feet high, and are, therefore, very desirable for northern sections. All are hardy as far north as Washington, and some specimens are reported hardy near Philadelphia.

Hesperalaea Yuccafolia, or Red Flowering Yucca — This species was described by Prof. Engelmann more than thirty years ago. It is a native of western Texas and northern Mexico, but does not seem to have been introduced to cultivation until some twelve or fifteen years ago, when we received plants of it. The flower stalk appears about May and produces a continual series of flowers during the summer and until late in the fall, each individual flower lasting from six to eight days. It is a showy plant, but very slow in propagating, as the best way is to increase it by division. Seed pods form very seldom and seedlings always come true.

Limonium Trifoliatum, or Hardy Japan Lemon [Synonyms: Pseudaegle sepiara, Citrus trifoliata, Citrus triptera, Karatachi (Japanese name)]: This plant has been known in botanical collections for many years past, but its value as a stock for oranges was only lately discovered here, when plants of the Kum Kwat orange sent us by Dr. Geo. Hall from Yokohama in 1873 were found to be grafted upon the Citrus trifoliata. We immediately began to propagate the best varieties of Florida oranges (taking a hint from our Japanese friends), and in a few years Florida orange growers reported through their horticultural papers that this stock caused nearly all oranges to withstand more frost than trees of the same varieties budded upon either the sour orange or wild lemon.

But its great value as a stock is that it dwarfs the graft in the same manner that the Paradise does the apple, and this produces plants eminently suited for pot culture, a two-year graft usually setting fruit, and plants three to four years old and not above three feet high can carry a crop of from 10 to 20 large oranges. Trees grafted upon the lemon or sour orange stocks do not take kindly to cramped quarters, and as they require large tubs and much room, they are often undesirable for small conservatories. This is obviated by using the Citrus trifoliata, and a plant in an 8 or 10-inch pot laden with large, luscious fruit demonstrates the value of this class of plants.

As a hedge plant for defensive purposes, it is destined to supersede any of the thorny species heretofore used for that purpose. It is of rapid and compact growth, remarkably easy to transplant, free from insect depredations or diseases, and does not throw up suckers. Though deciduous, the vivid green color of the bark gives the hedge a bright appearance in winter. Hedges planted in good soil and properly cared for will at their third year be so compact as to prevent a rabbit from coming through, and are a formidable barrier to man and beast. Being hardy as far north as the latitude of New York city, it is, therefore, one of the most desirable plants for protective hedges. P. J. BERCKMANS.

Fruitland, Augusta, Ga.

Field of the Polyantha Rose Marie Favie, at Fruitland, Augusta, Ga.

VIOLET NOTES.

The issue of The Review for the 28th is just at hand, and I find that I or the printers have made a little mistake, which makes me say what I do not mean. The sentence commencing, "More plants," etc., should read: "More plants can be grown on a given piece of ground, as one can plant closely, and then, too, a 'horse' cultivator," etc., not "hand" cultivator. This, as will be seen, quite changes the meaning.

With us it has continued to rain more or less all the week — mostly more—so that we have been unable to do anything to the fields preparatory to planting. Care should be taken not to neglect the young plants as a consequence, as is the natural inclination with the increasing spring work and need of room. One is frequently tempted to relegate those which are pricked out in flats under the edges of benches, etc., but don't do it, as the results are soft, drawn plants; first over watered and then over dry, and by the time you are ready to plant out you have a poor plant in some one respect, if not more than one.

We think it better to give them too much air and light, rather than err on the other side. Therefore, if you have not room in the house, or cold frames for them, find some place sheltered from too strong winds, and where they can be conveniently watered outside of the house. Extra caution will have to be used about watering, as they will dry out so much faster than in the house (unless it rains all the time, as for the past week). This treatment will harden them off, and they will bear transplanting into the open ground much better than if taken directly from the houses.

Some growers advocate buying your stock every season, claiming that they have better flowers thereby. We have not experimented largely in this line, not having had good results in what we have tried. However, we have ordered some stock from different localities to try again this season, and we shall try part of each lot, both inside and out of the houses. I shall be disappointed if they do well the first year, for, as I have before stated, our experience is that it takes one or two seasons for them to get acclimated, so to speak. However, we shall watch the development with interest. We hope that others will try the same method and report the results, as we believe that this department would be of much more use to growers if such things were freely discussed, and anything out of the ordinary line reported for the benefit of all.

R. E. SHUPHELT.

SHEEP MANURE FOR THE LAWN.

I have a quantity of sheep manure, and thought of using it as a fertilizer for the lawn. Would you advise using it for this purpose, and if so, in what way, to obtain best results? E. W.

Sheep manure is a good grass fertilizer and an application of 600 pounds per acre, or even more on certain soils, would be all right. A cheaper fertilizer (cheaper as regards the amount of plant food per dollar of cost) could be compounded by any dealer in fertilizers. The best proportions would be 6 per cent. nitrogen, 5 per cent. phosphoric acid (available), and 3 per cent. potash. According to a simple rule, this figures $26 per ton, and may be applied at the rate of 200 pounds per annum per acre in two applications, say one now and another two months later. Finely ground tankage contains about the proper proportions of plant food for lawns and it can be had from $18 to $24 per ton. J. A. P.

MISCELLANEOUS SEASONABLE HINTS.

Chrysanthemums.

A subscriber, "S W.," sends the following: "Which is the best culture for chrysanthemums raised and planted in a greenhouse? If you desire very big flowers, must there be any pinching done, or do you allow just one single stem for each plant? When is the best time for planting them in the bench?" A very few weeks ago there apeared in The Review a rather exhaustive article on chrysanthemums whieh covered all the points of inquiry, but evidently "S. W." has not been a "constant reader." Briefly, to answer these questions I would say, plant at once in 5 inches of rather neavy loam, with a fifth of animal manure added, and bone flour in the proportion of one quart to two bushels of soil; plant firmly. No pinching must be done; let the main growth go right up, only keeping all side or lateral growths pinched off. For specific instructions about watering, ventilation, disbudding, and other essentials, please look up No. 19 of Florists' Review.

Spreading and Standing Over Plants.

After the last shift has been given to geraniums, fuchsias, pelargoniums, cannas, and much other spring stock, your labor is not nearly done by simply watering. This is just the time that many plants, and most plants, unless hindered by a shady house and the absence of artificial heat, will make a rapid growth. It is the season of vigor that suceeds a semi-hibernating state. Standing over and giving more room to a batch of plants costs so little that it should never be neglected. A very slow man will stand over and space 4,000 geraniums in ten hours. Supposing he received $2 per day, and the boy that helped him $1, that would be 75 cents per thousand. By giving them another inch of space, removing a yellow leaf here and there, and perhaps a too-early flower that you don't want to mature, you have added at the very least $1 per hundred to their value, and most likely much more. Still, if you see a batch of drawn-up, leggy, sickly-looking plants, the owner says: "They would have been better, but I didn't have time to give them a move-over."

Many of our bedding plants, geraniums, coleus, cannas and others, should have no shade, but in the absence of shade much watering will be needed, and what will help to dispense with much watering, to the great benefit of the plants, is to plunge the pots to at least half their depth in some cheap and easily handled material. Remember, it takes a little time and a little material to plunge the plants, but the saving is at least one watering a day on the hot days of this month, and the great vigor shown by those plunged compared with those continually dried out will pay over and over again. Sifted coal ashes, tanbark, old hotbed, and, best of all, spent hops, will do as a plunging material. I don't say this plan is absolutely necessary, but it will save labor and produce a plant much better fitted to stand the sun and wind than one grown in a shady house.

The Ivy Geranium.

I spoke above of keeping flowers picked off till they were wanted. Of all common flowers that is most essential in the beautiful ivy geranium, for fine blossoms as they are, they soon exhaust themselves if the flowers are not kept picked. They are beautiful plants, but when planted out make a strong growth and quickly go out of flower. When their roots are limited to a large jar, vase, or veranda box, they are very satisfactory, and will continue to flower for months if not exhausted by old flowers being left on. This is largely true of our common zonale, or bedding geranium. When a plant is allowed to run to seed, it is exhausting its strength more than all the fine expanded petals do. Geranium flowers are some of the most durable of all if placed in water, and for cemetery purposes we have never had enough.

Roses.

Not much later than this should your stock of young roses receive their last shift, which is a 4-inch; larger than this is not necessary, and to remain in a 3-inch till planting time they would get stunted. In a more southern latitude you could, by the middle of this month, place them in a cold frame, and later remove the sash, which will give them a good, hardy growth. With us the period that they would be benefited by a move to a cold frame would be too short to be of much avail. So place them in a light house, where you can ventilate perfectly. No shade should be given, and a plunging would be of the greatest benefit to them. American Beauties will want the same treatment as the teas. Endeavor to get a good, strong, growing plant by the middle of June or, latest, by first of July.

Hanging Baskets.

This is a feature of ornamental gardening that has been for some years decidedly on the wane, but yet is by no means dead. Hung round a brownstone mansion, they would be absurdly out of place, but on the veranda of the more modest villa, they are quite endurable. We have often thought we would get "stuck" on a hundred hanging baskets, but about the middle of June, sure enough along would come somebody that wanted them for a new summer resort, excursion steamer, or something else. How they are abused and what hideous objects they become before half the season is over is none of our business. If intelligently cared for, they have a fresh and pleasant appearance till frosts of autumn gather them in. There are hanging baskets of wood, of earthenware and of wire. The latter is the only kind tolerated here, and is in every respect the best. When lined with green moss from the woods, they are sightly in appearance and the roots of the crowded plants find a most congenial feeding ground if not allowed to get parched. It should be unnecessary to say that the richest soil should be used in the baskets, for there are ten times as many plants occupying the space as should produce one healthy, growing plant; but with all that they exist, and even grow if faithfully cared for.

If in a shady place you can use as center plants fuchsias and Rex begonias, but if exposed to sun and wind and perhaps dust, you had better select for the center or upright plants any of these: Geraniums, coleus, achyranthes, Begonia vernon, ageratum, or almost any plant that will stand the sun and little root room. The chief attraction of a hanging basket is the so-called vines, or, more properly, the plants that will droop and keep green. Even if the center plants should wilt, if the droopers hang down and make a pretty effect, you will hear no fault finding. Of these, there are a number, and when arranging them on the edge of a basket see that those of a shorter growth, like lobelias, are alternated with one of more rampant growth, such as senecio (German ivy). There is lobelia, senecio, money vine, the variegated glechoma, vincas, ivy geranium, grammanthes, maurandya, nasturtium, double sweet alyssum, Pylogne suavis, sedums, small plants of English ivy, Solanum jasminoides, and others. We fill the baskets about the middle of May. They are then in good condition to be exposed about the first of June. WM. SCOTT.

A ROSE TWO INCHES TALL.

A rose bush in bloom, not over two inches tall, was recently shown us by Mr. W. C. Egan, Highland Park, Ill. It was a little specimen of Rosa poly-

antha nana in a thumb pot with one good bloom at the top. The plant was only 48 days from seed. It seems as though there would be a sale for a limited number of such diminutive plants, for the ladies who saw this plant all agreed that is was "just too cute for anything."

COPYRIGHT 1898.

CHICAGO.

The Market.

There is an abundant supply of all stock, and prices are very moderate. Tea roses range in price from $1 to $3 a hundred, with rare sales of the very choicest at $4, the bulk of the sales being made closer to the lower figure. Carnations range from 40 cents up to $1.50 per 100, only the very fancy going above the latter figure. There have been large sales of out-door bulbous flowers and lilac which seem to be of superior quality this year, and this has undoubtedly affected the prices of roses and carnations. The Greeks are thick on the streets, and they are evidently an important factor in disposing of the bulk of the stock after the choice shipping grades have been selected out. The returns to some of the growers must be very small. At the same time the opinion is general that conditions are not so unfavorable as at the same time last year.

Club Meeting.

The regular meeting of the Florists' Club was held last Thursday evening and the timely paper on bedding plants by Mr. C. J. Stromback was listened to with much interest. The paper and a full report of the discussion appear elsewhere in this issue.

This was the last meeting at the old quarters. The next meeting will be held in room 417 at 40 Randolph street Friday evening, May 6. This brings the two meetings rather close together, but was necessitated by the change in meeting nights from the second and fourth Thursdays to the first and third Fridays of the month. At the meeting tomorrow night the subject will be, "Palms, Ferns and Decorative Plants," and it will be opened by Mr. E. Wienhoeber.

At the adjourned session last Thursday evening several hot games were rolled. Samuel Murray and Arthur Newell, of Kansas City, and Mr. Nicholson, of the Texas Seed and Floral Co., Dallas, Tex., were visitors and took a hand. But most noteworthy of all was the presence of the veteran Sam Pearce. It isn't often we get Sam out to a meeting nowadays.

The bowlers will in future meet every Friday evening for practice at the alleys at 77 Randolph. They are good alleys to train on, being full regulation in every respect. Fat scores are not common, but when you see one you know it was earned. The boys have an eye out for the honors at Omaha.

Various Items.

Bassett & Washburn have rented the big Mitchell greenhouse at Hinsdale and will use it for carnations. This house is 50 feet wide and 550 feet long. It will be entirely remodeled, iron pipe supports substituted for the present wooden ones, ventilators added, tile benches built, and new water supply provided. The carnations to be grown include 5,000 Mrs. Bradt, 7,000 Flora Hill, 3,000 Mary Wood, 3,000 Mayor Pingree, 3,000 Jubilee, 1,000 Lily and Maud Dean, 1,000 Psyche, 1,000 Painted Lady, 1,000 Armazindy, 500 Mrs. Frances Joost, 500 Gold Nugget and 500 assorted novelties. This house is so close to their present large plant that it can be easily handled in connection with it. It is evident that Bassett & Washburn have faith that novelties are profitable. The high prices obtained here all season for really high-grade blooms of Mrs. Bradt and others undoubtedly influenced them in the matter.

A. Anthes has opened a floral store at 286 North Clark street.

Mr. J. A. Budlong, the Bowmanville rose grower, will open a city wholesale store May 15.

A. L. Randall has heard so much of the springs at West Baden, Ind., that he has decided to try them himself, and will spend a week or ten days there.

Klehm's Nursery is growing a fine lot of longiflorum lilies for Decoration Day trade. They will be sold by Kennicott Bros. Co. Wire John, at Kennicott's, who can build most anything in wire, has just completed a wire frame model of the warship Maine, 7 feet long. It is for F. Mendonza, the Forty-third street florist, who will use the piece for a window decoration.

E. H. Hunt is gaining strength very slowly and is still unable to visit his place of business.

A gardener by the name of Herman, employed at the greenhouses of the Rogers Park Floral Co., dropped dead of heart disease last Saturday.

Mr. Henry Wietor is still confined to his house by illness.

NEW YORK.

In the Wholesale District.

The market is still inactive and prices are what you can get, not what you ask. The early part of the week was only characteristic of what it has been since Easter. The latter part improved somewhat, however. This was rather the result of a lightening of shipments than any excess of demand, and prices ruled the same.

Beauties are still a bugbear, and will continue so, it is expected, till the hybrids pan out. Other stocks of roses far exceed the demand, and there is considerable mildew among the poorer grades of flowers. To say that $5 to $20 per 1,000 was a fair average price would not be far from the mark, Beauties reaching top at 20 cents. Hybrids are still coming in, and are of exceptional quality and command fair prices.

Carnations have not been over-plentiful, and sold slowly till the slight reaction. Poor stock suffers severely at these times, and the only outlet seems to be the fitful Greek, who soars around like a bird of prey, ready to take advantage of the least glut in any line, but alas! what could we do without him; he is the scavenger of the market, so to speak, and one asks, what would become of this overplus if this outlet was completely cut off.

Violets are getting poor and "white eyed." The demand is correspondingly low, and stock is cleaned up at any price, only a few choice lots realizing a fair picking and living price.

Bulb stock, nit! Very few orchids in the market. Smilax is increasing in quantity, with less demand and price lower. A few white sweet peas, Emily Henderson, are to be seen, and some variegated varieties. The old standby, Blanche Ferry, seems to have the call, however.

The Retail Trade.

There is no material change in the stores and an inert lassitude reigns. You ask the reason, and the answer is, War. It is undoubtedly playing more or less havoc in all lines, the florists as usual feeling the tightening of the purse strings first.

One of the oldest and best known florists in the city, J. M. Hodgson, is a victim of the first of May, and his store, which has been one of the landmarks of Fifth avenue, is being torn down to make room for a more modern structure. Meantime Mr. Hodgson has moved up the "avenoo" a little higher to Forty-sixth street, and we hope continued success will attend him.

The Marts.

Brother John Cleary is nothing if not patriotic, but he has been so busy lately that he did not know a state of war existed, and while his neighbors were displaying "Old Glory," he unwittingly hung out "his red flag." Since then he has been explaining to deputa-

View in the wholesale store of Reinberg Bros., Chicago.

tions of zealous citizens that he is not an anarchist. All the same the cigars are on John.

The Club.

Next Monday, at the regular meeting of the New York Florists' Club, besides the usual monthly exhibit for the club's medals, Professor W. E. Britton, of the Connecticut Agricultural Experiment Station, will give an interesting talk on "Experiments With Chemical Fertilizers on Greenhouse Plants," and a large meeting is anticipated.

Various Items.

Greater New York is so great now that when any one comes from the Quaker City they bring along a chaperon, and so when our friend, Harry Bayersdorfer, passed through this city on his way to "Yurrup," to seek the "newest" in his line, he was accompanied by his genial partner, Paul Berkowitz. Mr. Bayersdorfer sailed Tuesday on the steamship Havel, and we wish him a bon voyage and safe return.

New Jersey.

At the regular meeting of the New Jersey Floricultural Society Monday evening, Malcom MacRorie in the chair, the usual business was transacted. The essay for the evening was, "Horticultural Societies; Their Purpose and Management," which was ably handled by Mr. James W. Withers, and brought out considerable discussion.

ST. LOUIS.

The Market.

The cut flower trade in St. Louis is not what it should be, and the glut is still with us, especially in carnations. Roses, too, have been very plentiful. Perles, Brides and Bridesmaids are the most plentiful. Quantities of cut flowers of all kinds are being received daily as a result of the high temperature, and there has been a heavy loss in all varieties, there being very little demand the past week, and only the very best of stock selling. It is impossible to sell the poor stock, even the fakir refusing it.

The various commission houses received some fine specimens of all kinds of flowers in season last week, but as trade is dull, prices are merely nominal. Funeral work seems to be on the increase rather than otherwise. Transient trade is almost entirely monopolized by the fakirs, who fairly swarm the down-town district. It has been a long time since prices were as low as last week. Carnations and roses have suffered alike in this respect. The market can not possibly consume all that is received, not even with the help of the fakir.

Beauties have been in fair demand, but have suffered with the rest. Short stemmed ones are nearly all bullheads and most of them have to be dumped. The best stock of Brides, Maids, Meteors and Carnots sells at $4; seconds, $1 and $2; mixed roses in 1,000 lots sold some places at $5.

Carnations are down with the rest; prime stock brings $1 and good blooms 75 cents, while the bulk sells at 50 cents, and in larger lots the price is less.

Violets are about over, and the few that come in bring 35 cents.

Bulb stock is about all cut. Tulips and Dutch hyacinths are coming in from the open ground. Sweet peas are not over-abundant yet, but the indications are that they will be shortly; price this week opened at 75 cents per 100.

Ferns are still very scarce. Smilax is selling well at 15 cents per string. One commission man who had a few ferns arrive last week put the price up to $3.50 per 1,000. This the florists did not relish, but had to have them, though in the future when ferns become more plentiful they will remember him for his kindness for selling them, even at that price.

Personals.

Mrs. Martin, who bought out Wm. Lingenbrink, in Alexander's drug store, 522 Olive street, a few months ago, has closed its doors.

Mr. Fred Foster, formerly manager of the Krebs Floral Company, has opened a wholesale house on Eleventh street, between Pine and Chestnut. The florists about town think he will do well if he makes money.

W. J. and M. S. Vesey, of Fort Wayne, Ind., are sending to this market some elegant stock; also their new carnation, Fort Wayne.

Riessen Floral Co. report lots of funeral work the past week; also a few good wedding orders booked for this month.

Max Herzog lost 1,000 feet of glass by hail Sunday afternoon. A few other florists in the same vicinity also lost a few feet. The storm likewise did a considerable damage to our parks.

Club Notes.

The members of the Florist Club should not forget to attend the next meeting, Thursday, May 12, at 3 p. m., as business of great importance will come up and there will be an exhibition of miscellaneous cut blooms by local growers.

The Florist Bowling Club made a change on Monday night and rolled four games of Cocked Hat. The evening was fine and the attendance was good. C. A. Kuehn was high man in the four games with 147; Beneke, second, with 137; Kunz and Beyer a tie for third place, with 134. The highest single game was by Beneke, with 54; Kunz, second, with 45; Kuehn, third, with 40. Next Monday night the club will made arrangements to roll a match game with the Concordia Turners of South St. Louis, and the team selected at the same time. A full attendance is requested. J. J. B.

PHILADELPHIA.

Weather Affects Supply.

Last week it was so unseasonably cold and wet (the latter not so very unseasonable) that the growers had to fire harder than six weeks ago. Relief came on Saturday, when it cleared, but many a grower was surprised to find how much coal the last week in April had consumed.

The effect of all this was to shorten

the supply of cut flowers considerably, which tended to steady prices. Transient trade was poor, but there were some weddings that caused a fair demand for blooming plants, yellow daisies and hydrangeas being most used.

Plant Trade.

The sales of stock for out-door planting are daily increasing. Hardy roses are in brisk demand.

The department stores are selling imported hybrid roses at 15 cents each, $1.25 a dozen. The growers offer strong 6-inch stuff at $2.50 to $4 a dozen. When really good, these find ready sale. It is a pity that this stock is all brought into the houses immediately after Easter. When wanted for planting outside, the plants do much better when not started indoors. Won't you keep part of your stock in the cold frames, gentlemen? The many buyers will pay you just as much, and will be better pleased.

There is a growing demand for the hybrid tea class of roses—something that will live outdoors and bloom all summer. La France is deservedly a favorite. The old-fashioned monthlies, such as Hermosa and Agrippina, are considered too small.

To return to cut flowers: Prices are about the same as last quoted. Beauties are a trifle lower. Tea roses are in fair demand, though the street men handle a good many.

Carnations are a little firmer than roses, except white, which have sold as low as $2 a thousand; $1.25 to $1.50 a hundred is about the price for good stock. It is likely that less of the divine flower will be grown in the suburbs of this city next season. The growers from farther out of town, where the cost of production is less, are gradually crowding the nearby growers out of the market. Distance counts for less with this flower than might be supposed. When carefully packed the express companies can deliver them with speed at moderate cost.

Out-door bulbous stock is coming into bloom. Comparatively few of these flowers find their way to the stores, most of them being planted out for effect in private gardens.

Notes.

Patriotism is shown by the red, white and blue ribbons seen in one of the store windows, and the club has already sent one member to the war. The Bible quotation of "the last shall be first" applies here.

Robert Scott & Son are hard at work moving their glass from Eighteenth and Jackson streets to Sharon Hill. Ten new houses are to be built for cut flowers and the old houses rebuilt for growing young roses.

C. and G. L. Pennock are engaged in extensive building at Lansdowne.

Landis & Co. (H. D. Rohrer) are putting up new houses at Lancaster.

Philadelphia boasted four rose-growing foreman who stand head and shoulders above their fellows. The first of these, Isaac Kennedy, is wisely content in these stirring war times. Another, Stephen Mortensen, has, under the alias of "Samuelson of Hatboro," been sending in some fine stuff from his new place at Southampton. A third, A. Fahrenwald, is hard at work building three 150-foot rose houses at Hillside, Montgomery county. Now, what has become of P. H. Meehan?

Marmaduke Tilden, of Madison, N. J., was in town last week. Mr. Tilden sent to the New York market some of the best Beauties seen in Madison last winter, and you know the standard for Beauties in Madison. J. W. Y.

CINCINNATI.

Review of Trade.

Trade during the past week might be called fair, but that is the best we can say for it. Some flowers are selling well, while others are a glut. Beauties are in the lead, choice stock going lively at $2.40 per dozen. Meteors come next at $4 to $5 per 100; Brides and Maids, $4, and Perles, $3.

Harrisii and longiflorum are plentiful, with but little demand, and are selling anywhere from 50 cents to $1 per dozen. Colored carnations, especially red ones, are going slowly. White sell fairly well at $1.50 per 100. Valley is scarce and of course there is a demand for it. When obtainable it sells readily at $3. Smilax and asparagus sell well, owing to the scarcity of ferns.

Notes.

The Fair, a large department store of this city, is evidently laboring under the impression that there is big money in the florist business, as they have recently opened up a cut flower department, with Harry Edwards as manager.

Francis Rutland, of Lockland, O., has disposed of his greenhouses to W. K. Partridge, who for years has had charge of the seed department of J. M. McCullough's Sons.

Max Rudolph, the Twelfth street florist, will shortly visit his parents in Germany. B.

WANT ADVERTISEMENTS.

WANTED—A good rose grower. Also a good man for orchids, ferns and palms, for commercial place. Address Minnesota, care of Florists' Review.

SITUATION WANTED—By a practical English florist and grower of No. 1 roses. Carnations, 'mums, violets a specialty. Now disengaged. Age 39. Commercial or private position. Address W., Florist, box 547, Alliance, Ohio.

FOR RENT—For greenhouse purposes, 32,700 feet on Michigan Avenue. Long lease and low rental. Room 922, 184 La Salle Street, Chicago.

SITUATION WANTED—By thoroughly practical all round gardener. Capable of taking entire charge of a gentleman's private place. Exceptional references as to character and ability. Address Gardener, care of Florists' Review, 105 Hudson Street, New York City.

SITUATION WANTED—By a competent florist and gardener, 14 years' experience in growing cut flowers, tropical plants, cyclamen, etc. Also a first class designer and decorator. Capable of taking charge of place of any extent. Age 30, single. R. S., care Florists' Review.

SITUATION WANTED—An experienced florist (of 20 years) and wife wish a situation to run a flower store or work in greenhouses as makers up of florists' designs. Best of references. Man a total abstainer. G. Y. C., care Florists' Review.

SITUATION WANTED—By young man, in retail flower store, ten years' experience. Capable to take full charge. Address W. W., care of Florists' Review, 56 Pierce Building, New York City.

WANTED TO RENT—Greenhouses in good working order, by experienced grower, or will run place on shares. Writing, give particulars. C. B. A., Florists' Review.

FOR SALE—At a bargain, 4,000 feet of glass, well stocked, with seven-room dwelling, barn and stable, everything in good repair, in a fast growing city of 40,000. A fine chance for a young man with push. For particulars address E., care of Florists' Review.

WANTED—Young man to take care of several rose houses. Must be competent and well recommended. Address Emil Buettner, Park Ridge, Ill.

WANTED—An experienced propagator and plantsman. One accustomed to hard and soft wooded plants, where a great many are grown for a catalogue trade. Must be a hustler. No drinking man wanted. Steady place and good wages to right party. Apply with references to James Souden, foreman for L. L. May & Co., St. Paul, Minn.

FOR SALE—Six greenhouses, about 14,000 feet of glass; well stocked; wholesale and retail town of 4,000; no competition; less than 100 miles from Chicago; two railroads; good seed trade. For particulars address A, care Florists' Review.

WANTED—By the 15th of June, a first-class all 'round florist to take charge of plant of 8,000 feet of glass. None but steady reliable man need apply. References. Wages $50 per month. Address X, care Florists' Review.

SITUATION WANTED—As private gardener, by thoroughly competent man with the highest references from last employer and others. Removal of employer only reason for change. Address K. X., care Florists' Review.

SITUATION WANTED—By A1 grower of roses and other cut flowers and plants, as working foreman; has held similar positions in Chicago; best of references. Address E. C. care Florists' Review.

SITUATION WANTED—By florist and gardener; good grower of roses, carnations, mums and general stock. Only those in need of a good man and are willing to pay fair wages need apply. Address K. K., Florists' Review.

WANTED—A first-class grower who knows enough to run a place on business principles, to buy one-half interest and take full charge; must thoroughly understand the business. If dissatisfied with his purchase any time within one year he can have his money back. For particulars address A. H., care Florists' Review.

SITUATION WANTED—By expert grower of plants and cut flowers. Competent in every department. Seeks a situation where he may have a chance to make his services worth more than in his present place. Can surely advance his employer's interests if given suitable opportunity. Address S. D., care Florists' Review, Chicago.

The Jordan Floral Co. of St. Louis, offer for sale their greenhouses, 20 in number, with complete heating plant, covering about 3 acres of ground, with all stock and good will of the business. Will lease ground on fair rental value long as wanted. Established trade over 35 years. This is an opportunity of a lifetime to buy a good established business. Also have a large retail store opposite the Post Office. Apply to **LEON L. HULL REAL ESTATE CO.**
804 Chestnut St., St. Louis.

Chevy Chase Greenhouses,
CHEVY CHASE, MD.
(Suburb of Washington, D. C.)
For full particulars, write or see the representative of The Chevy Chase Land Company, at Chevy Chase, Md.

BUFFALO.

The writer has been so much occupied of late with moving old store furniture, paper boxes, cash registers without any cash, and other trifles, that little time has been left to note the state of business. From the great dearth of weddings, it is evident that betrothed parties have postponed the blissful time till after the fall of Havana. There are plenty of flowers, with only a moderate demand. Very cool, cloudy, unsettled weather has also helped to make us quiet.

Mr. Wm. Kasting, our widely known commission man, has just returned from a visit among his customers in Pittsburg, Wheeling and other cities in that direction, and from his appearance must have made many friends, for he looks awfully contented.

Plant men are looking forward to a brisk and lively time, for there are certainly many hundreds of homes requiring some "ornamental horticulture" that did not exist last spring, and the increase in stock grown is little if any more than formerly.

W. S.

HUNT'S REVIEW OF THE CHICAGO MARKET.

Cut flower business for the past week shows no material change from the preceding week. Trade is very slow and no mistake. Supply continues heavy and demand light. Buyers wanting but little buy little, and will take only the cream. This leaves the bulk of the stock of fair to good quality to be worked off as best it can, and it is needless to say it goes for little money.

The supply of strictly fine Beauties, extra long stems, is in excess of the demand, Maids and Brides selling best in rose line.

Supply of Harrisii is easing up a little, but call for them continues light. Outdoor grown tulips are in evidence, among them some very fine Parrots. Smilax extremely scarce, there being but little really first class on the market.

Mildew is noticed on stocks of some growers, but not badly as yet. Outdoor narcissus and daffodils are abundant, with very limited sale. Taken all in all, though grower, retailer and commission men are dissatisfied with present condition of business, we think it will be found to be considerably better than for the same time a year ago.

BALTIMORE.

Trade Conditions.

Trade has shown very little improvement over last week's chaotic condition and is still extremely quiet. In one short week the elements gave us samples of winter, spring and summer weather. Of these changes, however, the latter was the only one appreciated by the florists, as rain, hail and snow offered little encouragement to transient trade.

A few of the retailers were kept quite busy over several large wedding orders which had been previously booked, but barring these there was little else of note.

Roses are very plentiful, far beyond the demand. Carnations are not over abundant; as they seem to be the most popular flower, there is no trouble to sell out. Heavy shipments of Harrisii are arriving from Oakland, Md., our local supply being over. Sweet peas are in, but do not sell in the colors. White sweet peas for weddings have been the rage.

Bedding plants at the markets are not selling well on account of the inclement weather. At this season of the year the stall holders do a large business in that class of stuff and consequently are carrying very little other stock.

Notes.

At the last meeting of the Gardeners' club Mr. Paul Binder, our financial secretary, was prevailed upon by a unanimous vote to reconsider and withdraw his resignation.

Mr. Fred. Bauer, of Govanstown, Md., read a paper upon the utilization of greenhouse space. He gave in detail his ideas of how a commercial place carrying a miscellaneous stock should be conducted, which, on the whole, proved very interesting and instructive.

Visitors.

Mr. Wm. Scott and Mr. C. F. Christenson, of Buffalo, were with us a few days this week. The writer regrets very much not to have been in when these gentlemen called, but a severe cold prevented his attendance to business the entire day. Mr. Alexander Scott (who is a brother of our well-known visitor) had these gentlemen in tow, and they were consequently in good hands.

Mr. J. J. Styer, of Concordville, Pa., was another visitor. Mr. Styer is quite a large grower of carnations.

VAUGHAN, McKELLAR & WINTERSON, 45, 47 and 49 WABASH AVENUE, **CHICAGO.**

OMAHA, NEB.

Trade is excellent in both cut flowers and plants and fair prices are realized. Omaha begins to feel the effect of the Trans-Mississippi Exposition, which will open its gates June 1. All the buildings are completed and ready to receive the exhibits except the horticultural building, upon which there is some work yet to do.

The grounds look beautiful. The weather is favorable for the lawns and trees and we have had quite a good deal of rain of late. The arrangement of the grounds shows great skill on the part of the landscape gardener; they are fully as grand as those at the World's Columbian Exposition. The florists here are taking much interest in making a creditable display. Mr. Chapin, of Lincoln, has charge of the state display, and Mr. Hess, of Omaha, has charge of that for Douglas county.

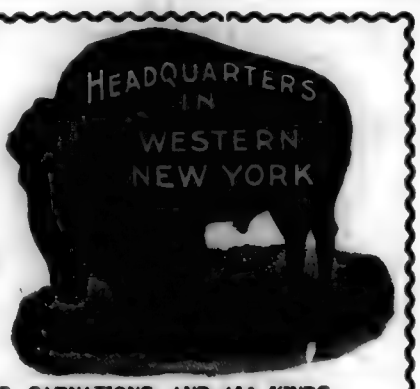
Mr. Reed has sold his interest in the firm of McPherson & Reed, of Council Bluffs, to M. Frey, late of Lincoln, Neb., and the firm name is now McPherson & Frey.

Karr & Davidson will open a store on Douglas street.

Recent callers were Mr. Ford, of New York, and A. L. Vaughan, of Vaughan, McKellar & Winterson, Chicago.

At its last meeting the Nebraska Florists' Club changed its name to the Nebraska and Iowa Florists' Association.

J. J. H.



THE National Florists' Board of Trade of New York has moved into larger and more commodious quarters on the fifth floor of the same building, where there is ample room to handle the increasing business of the concern. The street address is still 271 Broadway, but the telephone number is now 1955 Cortlandt. Mr. Cornelius S. Loder, the enterprising secretary, is entitled to the thanks of the trade for the excellent work he has done in securing reliable credit information for members. No one selling to the trade can afford to be without the information supplied by the Board.

YOU CAN BUY all your trade supplies to the very best advantage from advertisers in The Florists' Review, and at the same time advance the interests of your paper.

BOSTON.

Review of the Market.

The past week has been very cold and backward, having a tendency to keep stock short, so that there has really been no great surplus, with a fair demand, considering the weather.

Roses of the common kinds are plentiful at prices ranging from $4 to $10 per hundred, while red roses of good quality are scarce and sell readily at anywhere from $1.50 to $4.00 per dozen.

Carnations are still inclined to be extremely short, and are bringing from $1.50 for Mrs. Fisher to $5.00 for Bradt and Flora Hill. The cool weather has improved the quality of violets, which are going fairly well at 50c per hundred.

Sweet peas are plentiful at $1.25 per hundred. Lilies a drug at $3.00 to $4.00.

News Items.

The famous Francis B. Hayes place at Lexington is now a thing of the past and the regular contributions to the many shows of the Massachusetts Horticultural Society will be very much missed. The fine specimen foliage and flowering plants, for years the pride of Gardener Comley, were sold at auction on Saturday, April 30, by the well known auctioneer, Edward H. Hatch. The trade from this vicinity was well represented at the sale.

George Mullen, who up to a few weeks ago was doing business on Park street, is reported to have disappeared, and his whereabouts are unknown. A meeting of his creditors is called at the flower market during this week.

George Seaverns, a florist of Weston, has gone to the Klondyke.

Wm. McTier, a New Jersey florist, is erecting a new commercial house at Wollaston.

Thomas H. Meade, a well known rose grower of Dorchester, is the new manager and editor of the N. E. Florist.

James M. Touhy, for several years with his brother, P. J. Touhy, of South Boston, has opened a store in Maverick square, East Boston.

The annual banquet of the Gardeners' and Florists' Club, will take place at Horticultural Hall Tuesday evening, May 30.

The great interest in the Hayes auction prevented most of the exhibitors from taking part in the weekly horticultural exhibition. The only things of consequence shown were a few flowering plants and vegetables.

For visitors, we have had Mr. Winifred Rolker, of New York, and a few of our Holland friends, including P. N. Koster and J. Blaauw, now on their way home.

Mr. Peter Barr, a well known seedsman from London, Eng., has been doing the "Hub" this week. P.

New Forcing Rose.

Mrs. Robt. Garrett, Hybrid Tea.

Rich, soft pink buds, very long, flower extra large, delightfully fragrant, rivaling Bridesmaid in color, but larger and much more productive. A sturdy vigorous grower. A money maker and a triumph of American skill. The best firms in the country are investing in it. It has won numerous prizes and elicited the most favorable comment from critical judges.

Price, strong plants, from 2½ inch pots, $25.00 per 100. In lots less than 1000 $225.00 per 1000.

Orders booked now, delivery March 15th, 1898. Correspondence solicited.

MILWAUKEE.

The Market.

Trade has assumed a steady, quiet nature. Stock keeps moving fairly, with no apparent sign of an immediate glut. Violets are about gone; a few good ones are still coming in, but as the season is past, the demand is light for them. Bulb stock has also seen its day, with the exception of a few Harrisii and longiflorum, which were booked for Easter but were a little slow in arriving. Prices still average fair, roses bringing $4 for selects; carnations about $1.00 to $1.50. Beauties are short of demand. Smilax is also scarce and commands a good price. Sweet peas are coming in in better quantity and quality. The early ones bring about $1 per 100.

Park Notes.

Bedding stock is getting attention now. The city has leased some glass for the storing of stock and for the purpose of growing some of the commoner varieties of bedding plants. We hope to see in the course of a few years large conservatories erected, as Milwaukee is considerably behind in this respect. Many other cities of smaller size control their own greenhouses. Extensive preparations are being made for the improvement of the parks, in which all florists here should share the benefits thereof. At a recent meeting of the council a resolution was made to appoint another park superintendent. Since Mr. Pettigrew left us it was in the hands of a park commissioner.

Various Items.

Some changes will be noted in the town stores soon. Miss Sarah Engel, who for some time conducted a store on the West Side, will probably discontinue and enter in the employ of F. Hesse, a South Side florist. Miss Smith, who had charge of the flower department in Jones' drug store, will go back to her former employers, Currie Bros.

Holland bulb agents were not so numerous as last season; probably the tariff had the effect of keeping some on the other side. They must have made some inroads on the profits of American jobbers, as their prices seem strikingly low to buyers, while if duty, freight and packing charges were added they would appear different and equal to American prices.

Lloyd Vaughan, representing the Chicago triplets, V., McK. & W., called on the craft and left town in a happy frame of mind, overloaded with orders, so he says.

GEO. WASHINGTON.

IN THE adv. of Mr. H. Steinmetz, Raleigh, N. C., on page 880 of last week's issue, the price of Arundo Donax variegata should have been $5.00 a hundred instead of 50 cents. The adv. is correct in this week's issue.

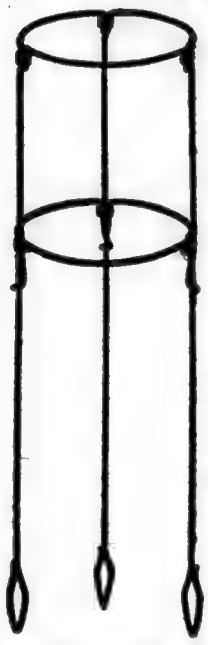
Grand New Violet "La France."

STRONG VIGOROUS GROWER.

EXTRA FREE FLOWERING.

RICHEST COLOR.



Of the many new Violets introduced in the past few years this, the latest introduction of the foremost French specialist, is unquestionably the **BEST.** It has been thoroughly tested by Mr. Supiot, the Violet expert, who pronounces it "perfect," and flowers which we have exhibited during the past few weeks have been much admired. In vigor of growth, freedom of bloom, and in size and coloring it is superior to all existing sorts, and will soon supercede them. Only a limited stock will be offered this season, and orders will be filled in strict rotation

Price, $1.25 per dozen; $10.00 per 100.

HENRY A. DREER, 714 Chestnut Street, Philadelphia, Pa.

The Model Extension Carnation Support

QUEENS, N. Y., Feb. 16, '97.
MR. THERON PARKER, Brooklyn, N.Y. Dear Sir:—I have tested your latest Model Carnation Support, and am free to say that I consider it the best wire carnation support that I have ever seen. It is quickly and easily applied, and I think will prove very durable, and you certainly deserve great credit for the invention.
Very truly yours,
C. W. WARD.

FLATBUSH, BROOKLYN, N. Y., Feb. 18, '97.
MR. THERON PARKER.
Dear Sir:—Your wire stake is certainly a gem. Without hesitating we endorse it as an up-to-date Carnation Support. Yours truly,
DAILLEDOUZE BROS.

W. HOBOKEN, N. J., Feb. 18, '97.
MR. THERON PARKER, Brooklyn, N. Y. Dear Sir:—It gives me much pleasure to congratulate you upon your success in getting up Carnation Supports. I think that those I have had from you are about as perfect as anybody will be able to make them. They certainly fill my bill for an ideal carnation support, a thing I have been looking for for a long time. Wishing you every success in the sale of them, I am,
Yours truly, E. ASMUS.

Florists' Review
When Writing Advertisers.

ROCHESTER, N. Y.

Flowers are abundant and cheap, but the demand has been good for the last two weeks, and but little goes to waste so far. Prices are low and very unsteady. Some days an encouraging improvement is noticed, but it does not last very long, and the next morning may see job lots offered at ridiculously low figures again. Still, our retail florists are not complaining much. Sales during the past month compare very favorably with those of any April for some years past. Of course, this may largely be due to the increase in Easter trade, but there were not many real dull days for them since Easter, and quite often they were very busy and had to work late at night.

The trade in bedding plants is beginning earlier than usual; they are in evidence everywhere in all parts of the city. The present balmy spring weather is favoring early planting and people are impatient, though it is by no means safe to risk any of this soft stuff outside, except perhaps in well sheltered city yards. For years low prices were the rule here for all kinds of bedding plants. This season is no exception, and in all probability they will fall lower than ever before the end of the month.

J. W. Keller is settling up his business accounts, with the intention of quitting the wholesale flower business. Rochester florists will have to get along without a commission house, unless a new man starts in.

Around the entrance to Mount Hope Cemetery additional greenhouses have been built lately by several firms, one of them a new beginner; strange it seems that at the other end of the city, where two large and well patronized cemeteries are located close together, nobody starts in. Flowers to decorate the graves there have to be brought from the city stores. K.

MR. P. VOS, of the Holland Bulb Co., sailed from New York for Liverpool on the Umbria April 30. He reports a very satisfactory trip among the American trade and is especially gratified that he found all his customers well pleased with the bulbs shipped by him last year.

IN THE notes from Madison, N. J., on page 882 of last week's issue, a typographical error in a line in the last paragraph transformed a "hat mix up" into a "hot mix up." It was a mix up of hats, but not a heated one.

WARREN, O.—Mr. Geo. W. Gaskill has been quite sick for several weeks, but is now convalescent and expects to soon be able to be about again.

Extra select stock at Kennicott Bros. Co., Chicago. All flowers in season at lowest market rates.

Last Call For Field-Grown Roses!

ORDER BEFORE IT IS TOO LATE.

We still have to offer an exceptionally fine lot of

HYBRID PERPETUAL ROSES,

extra strong field-grown plants of the very finest sorts, such as **Mrs. John Laing, Ulrich Brunner, Mme. Gabrielle Luizet, Paul Neyron, Magna Charta, Gloire de Paris, Baroness de Rothschild, Gen. Jacqueminot, etc.** This is fine stock for potting for late spring sales or for out-door planting—fine strong blooming stock. We offer it as long as unsold at **$12.00 per 100.**

We have to offer also, a magnificent lot of

YELLOW RAMBLER ROSES,

strong dormant plants, 3½-inch pots, **$10. per 100;** 5-inch pots or strong field-grown plants, **$20.00 per 100.**

We offer also fine strong field-grown plants of

CRIMSON, WHITE AND PINK RAMBLERS,

at same price as Yellow Rambler.

We have a large stock of extra strong field-grown plants of **CLEMATIS**—finest sorts—**Mme. Ed. Andre, Jackmanii, Henryii,** and **Hybrida Sieboldii. Price, $30.00 per 100.**

CLEMATIS PANICULATA—extra strong field-grown plants, **$15.00 per 100.**

HYDRANGEA PANICULATA GRANDIFLORA—strong field-grown plants, 3 ft. high, **$12.00 per 100.**

AZALEA MOLLIS—extra fine, well budded plants, very bushy, **$35.00 per 100.**

We have also a few thousand **SPIRAEAS** left, which will make nice stock for potting for Decoration Day. Can offer strong clumps as follows: **Spiræa Astilboides Floribunda,** $5.00 per 100; case 250 clumps, $10.00. **Spiræa Compacta Multiflora,** $6.00 per 100; case 250 clumps, $12.50.

See our special offer of **HYDRANGEA OTAKSA** in last week's Review. This offer will hold good for this week. We sold a lot of this stock last week, and will hold the same offer open for another week. If you want any Hydrangea Otaksa, now is the time to buy it. Full particulars in last week's ad.

JADOO AT GHENT.

[Extract from letter from Col. C. Halford Thompson, Exeter, England, dated April 21, 1898.]

"At last we have a big score to give you from this side of the Atlantic. At the big show at Ghent—said to be the largest in Europe—amidst the strongest competition of the whole of the Dutch growers, Messrs. Byvoet Brothers, of Overveen, Haarlem, Holland, won the highest prize in the show for a magnificent group of hyacinths, 150 plants in 50 varieties, and also won a gold medal for the first prize for best collection of 100 hyacinths. In both cases the plants were grown in a mixture of Jadoo Fibre and Dutch sand. The well known grower, Van Houtte, was competing in both these cases.

"The actual awards were: For collection of 150 hyacinths: First, work of art, value 300 francs, unanimously awarded to Messrs. Byvoet Bros.; second, gold medal, value 150 francs, awarded to Van Houtte; third, gold medal, value 50 francs, awarded to Kuyk. For collection of 100 hyacinths: First, gold medal, value 100 francs, Byvoet Bros.; second, gold medal, value 50 francs, Kuyk; third, bronze medal, Van Houtte.

"The fact that so well known a grower as Van Houtte was among those beaten greatly enhances the value of the success, which will go a long way to bring Jadoo into use for bulbs of all sorts here. The actual quantity used was one-third Jadoo Fibre to two-thirds Dutch sand, but as the Dutch sand is itself very good for bulbs, it practically shows the use of half and half to be best."

GRAND RAPIDS, MICH.

From cold and wet, the weather has now changed and is fine and spring-like—so fine, in fact, that some people are already beginning to plant out geraniums and other of the hardier plants. Trade continues good; roses equal to the demand; carnations are scarce, though what there are are fine.

Dark violets are over and Crabb & Hunter are the only ones picking any at all. They have a house of Lady Hume Campbell, which are still fine. All are cutting sweet peas, and they and swainsona help out funeral work amazingly, of which there is still a steady stream.

Fashionable weddings and ante-nuptial teas and breakfasts are of almost daily occurrence, and keep the supply down close.

The spring bulb agent has blossomed again, although his bookings this year, on the whole, are not quite so large as last season.

ROCHESTER, N. Y.

I found your writer, "K.," delving among the perennials, of which he has a most complete and excellent stock. Those who read his interesting and instructive notes, and they are legion (the readers, I mean, not the notes, of which we cannot have too many) may rest assured these are taken from actual observation, which makes the reading so much more valuable.

Geo. Savage was potting up a mammoth vanda. He is giving his splendid collection of orchids their annual spring overhauling. W. M.

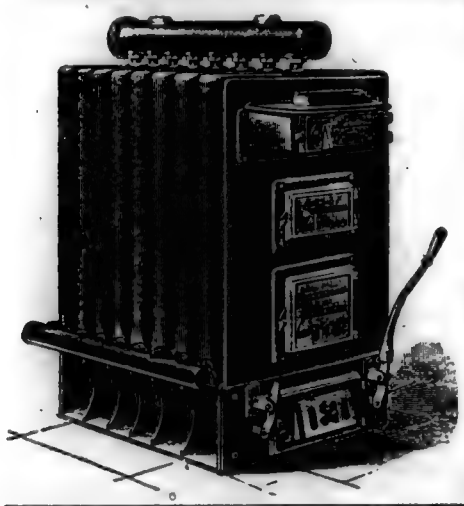
1859. "THE WEATHERED" 1898.

IMPROVED SECTIONAL BOILER,

1898 MODEL

For Water or Steam Heating.



A FEW POINTS CLAIMED FOR THIS BOILER

Simplicity of construction.
Sectional Headers.
Sectional ash-pit.
Maximum vertical circulation.
Minimum friction.
Direct or indirect draft.
Smoke-box on front or back.
Rapidity of water circulation.
Easily cleaned in every part.

Grates on level with fire-door opening.
Greatest amount of boiler surface exposed to radient heat.
Heating surfaces so arranged in fire-box that the hot gases must strike every part before entering combustion chamber.
The latest and most up-to-date hot-water or steam-heating boiler in the market.

MANUFACTURED BY

Thos. W. Weathered's Son, Office, 141 Centre St., New York City.

IMPORTANT!!

The BEST Hot Water and Steam Boiler is the

SCOLLAY INVINCIBLE

Office of JAMES WEIR, Jr. & SON,
Greenwood Cemetery,
Brooklyn, N. Y., June 16, 1889.

Dear Sir:—We have in use ten of your No. 5 Portable Boilers, and three of your largest size Sectional Boilers. We have always been well pleased with them especially the latter. Their heating capacity is great, and they are not extravagant consumers of fuel.

Very respectfully yours,
JAMES WEIR, Jr. & SON.

CO-OPERATION

IF you are in the trade and are not yet a subscriber to the FLORISTS' REVIEW, send in your name and one dollar now and you will receive not only the FLORISTS' REVIEW for one year, but also a certificate entitling you to the earnings on one dollar's worth of stock in the Florists' Publishing Co.

Why do we make such an unparalleled offer? It is very simple.

You will have an interest in the success of the paper.

You will see that you can buy everything you want to just as good advantage from advertisers in the FLORISTS' REVIEW as elsewhere and at the same time benefit yourself by increasing the earning power of your certificate.

This mutual arrangement cannot fail to bring to the paper a heavy advertising patronage, and as a result the stock represented by your certificate will earn good dividends.

And the more you buy of advertisers in the FLORISTS' REVIEW (always mentioning the paper), the larger your dividends will be.

You get the best paper in the field and a share of its earnings.

Send in your subscription now.

Vol. 1. CHICAGO AND NEW YORK, MAY 12, 1898. No. 24.

End Wall of the Warm House at Lincoln Park, Chicago.

COVERING CONSERVATORY WALLS.

That the otherwise unornamental end wall of a conservatory may be transformed into a thing of beauty is well depicted in the accompanying illustration, in which is shown a portion of the warm house at Lincoln Park, Chicago.

The first step toward this very pleasing result with the wall in question was made by attaching to the wall a covering of rough oak bark, in order to provide a moisture retainer, and at the same time to furnish a suitable surface to which the various climbing plants might attach themselves.

This was done about two years ago, and in the opinion of Mr. Stromback, under whose efficient supervision the work was done, the oak bark did not give the best results at first, owing to the amount of tannic acid it contained, this apparently repelling the plants for a time. In all probability this difficulty would have been overcome by the use of sheets of virgin cork in preference to other bark, the cork being very enduring and likewise attractive to the roots of many plants, its frequent use for orchid blocks being an example of its adaptability for such purposes.

In the Lincoln Park conservatory the plants are planted in a narrow trough or box placed close to the wall and at the back of the bench, the box being filled with light, rich soil, and requiring careful attention in regard to watering, the plants used being without exception moisture-loving subjects.

Among the plants used here are several of the philodendrons, one of the most satisfactory being P. varicosum (or P. Carderii), the large leaves of which appear in the upper central portion of the picture, while P. aureum is displayed to advantage at the left of the preceding. Various species of pothos are also found very effective,

the regularly spaced leaves of P. celatocaulis lying flat against the wall, being shown on the right.

Other prominent features in the picture are the beautiful specimens of Polypodium subauriculatum suspended in a basket from the roof, the luxuriant growth of which gives a good idea of one of the most beautiful basket ferns, and the thrifty and well-grown example of Calathea zebrina in the foreground. Several aroids, dracaenas and other foliage plants occupy the base of the picture, and a careful examination reveals Mr. Stromback, who is almost hidden behind the large calathea referred to above.

In addition to the plants noted, some of the ficus are well adapted for covering walls. F. stipulata and its variety minima, and also F. barbata being especially good for this purpose, their growth being rapid and the foliage having but little attraction for insects.

Piper porphyrophylla is another good subject for such use, its growth clinging closely to the wall, and its large, velvety leaves of dark green, marked with pink, being singularly attractive. From the fact that the plants to which reference has been made are natives of the tropics, it will be readily understood that a warm house and abundant moisture in the atmosphere are among the essentials to success in this kind of gardening, and frequent syringing helps much in establishing the plants upon the wall. Shading is also required throughout the greater part of the year, and especially so if the wall to be covered happens to face the south.

Clean young plants only should be planted for wall covering, it being practically impossible to eradicate such insects as scale and mealy bug when once established among the climbers on the wall, and if such an unfortunate condition should be discovered, the only true remedy would be found in tearing the whole arrangement out, thoroughly cleansing the wall and woodwork and then beginning over again. T. H.

Feeding.

Perhaps it is early yet to talk about feeding "mums," but last year one florist I know began to feed his plants with liquid manure in May. His result did not make any great stir in the exhibition world, and this year he will use more judgment and less manure. The mum is universally conceded to be one of the grossest of feeders, and in consequence the man that is starting out for the first time to grow exhibition flowers often makes a great mistake by beginning to feed long before the plants need it. What is the result? The plants grow very rapidly, but the growth is of a soft, long-jointed, sappy nature, the tissues of the stem never solidify, and firm, well-ripened wood is an impossibility. It is a fact that fine flowers were never yet cut from plants that had been rushed up seven or eight feet high in about six weeks; the wood must be matured.

When filling the benches, use good loam, full of fibre, with a liberal sprinkling of wood ashes and a little bone meal mixed through it. If the benches are planted in June, this will carry the plants along without any feeding at all, till they show the bud, all other details of culture having been properly attended to. Then, when the bud is taken, feeding can be indulged in to almost any extent, with the certainty that it is going where it will do the most good, namely, into the future flower, and having a sound basis of healthy, naturally grown wood to work on. Fertilizers at that time on such plants can be calculated to be three times as effective as they will be on plants that have become gross and bloated from early feeding.

We are not in sympathy with the idea of mixing a lot of crude manure with the soil. We prefer to use it later in the season as a mulch when the bench is full of roots. That is the time when it is beneficial. If the soil is heavy and deficient in fiber, a little old mushroom bed manure benefits it. Of course, no hard and fast line regarding feeding can be laid down; the grower, if he is interested in his work and is in sympathy with his plants, feels rather than knows when they need a stimulant. It may be that a yellow tinge shows in the leaves as a danger signal that digestion is not as it should be; then the water supply should be decreased and a little tonic of nitrate of soda administered. In a hundred ways will a plant show an observant and inquiring mind if it is happy in its surroundings, ways that are learned more by experience than anything else.

The great trouble is that we get into a rut and from year to year add our fourth or sixth part of cow manure to the soil without questioning whether it's right or wrong. By using proper care we have grown exhibition flowers in soil innocent of even the faintest trace of manure at planting time. Some growers claim that by the use of chemical fertilizers natural manures can be dispensed with altogether. It may be so, though it always seemed to us that best results were obtained where both were used, alternating from one to the other, thus giving the chemicals a chance to work on the manure, making its good properties soluble and in a condition to be taken up immediately by the plant.

We will refer to this question of feeding later on in the season, but if you are a beginner and feel tempted to use very rich soil, our advice is, don't do it. C. TOTTY.

WISTARIAS FOR FORCING.

One of the most pleasing novelties as a florists' plant that I saw amongst the great displays of flowering plants in the stores at Easter was the Wistarias, in neat bushy specimens about 3 feet high, adorned with several of its characteristic long, pendulous sprays of purple-blue flowers. Wistarias, as flowering vines for covering walls or any bare structure about the home, have been popular for many years, but the beauty of these forced plants serves to "point a moral and adorn a tale" by showing that whilst we scour the world for something new to offer, there are scores of available plants about us quite as well adapted to use and more likely to find favor from personal knowledge of them and associations therewith.

Possibly the wistaria best adapted for pot growth and forcing is the native American species W. frutescens, it being of a more bushy habit of growth than its Japanese relatives. A stock of it could be easily and cheaply raised from seed which it ripens freely in the open air, and the seed sown outside in spring will germinate readily. Given good cultivation in well enriched ground, the plants should attain a useful flowering size in two or three years, and beyond keeping them clean, the attention needed would be small.

The aim of the grower should be to secure the formation of flowering spurs, that is, short side branches, and to encourage this, gross growths that manifest a tendency to run away from the balance of the plant should be pinched two or three times during the growing season.

When plants of a desirable size have been secured, they could be lifted and potted in the fall and given ordinary forcing conditions, which for this plant need not be extreme, as being naturally precocious outside, it will quickly respond to the stimulus of forcing conditions under glass. The blue and pure white forms of Wistaria japonica are just as amenable, and more beautiful still, having much longer racemes of flowers. They, too, can be increased from seed or by layers, and systematic stopping of their

long, rampant shoots would induce the early formation of flowering spurs.

Many florists who would force stock of this description have no facilities for raising it at home, but the man with land lying idle and available resources would find an open and, I think, profitable field of industry in preparing forcing stock of this description of the most suitable flowering shrubs and hardy perennial plants.

A. HERRINGTON.

Madison, N. J.

A PHILADELPHIA STORE.

Just before Easter two photographs were taken for The Review at the store of Mr. Robert Crawford, Jr., 2335 Eleventh street, Philadelphia. The first picture shows a portion of the store, the view being toward the street. Just outside the front door Mr. Crawford is standing, keeping back the people while his store is being taken. This was pretty good of him when you consider it was in the middle of the rush.

On the right is the counter backed by the showy refrigerator, and on the left a handsome mirror, the special pride and glory of this beautiful store.

The second picture shows the greenhouse in the rear of Mr. Crawford's store, filled with Easter plants in bloom.

View in Show House attached to store of Mr. Robert Crawford, Philadelphia, at Easter.

PALMS AND FERNS.

The subject for discussion at the meeting of the Chicago Florists' Club last Friday evening was "Palms, Ferns and Other Decorative Plants."

The subject was opened by Mr. E. Wienhoeber. He spoke of the remarkable increase in the use of palms and ferns during recent years, and said that now every florist was really obliged to keep a stock on hand. In palms he considered the arecas more decorative than the kentias, but the latter stood wear and tear much better and gave customers more satisfaction as house plants.

In the supplying of plants for decorations he had noted a good deal of unwise cutting of prices. He held there was no profit in renting plants for decoration at $10 or $12 a load. A load of good decorative plants should be worth about $75, and as they always came back considerably injured he felt there was no profit in renting them out at one-seventh of their value. In his own business he makes it a point never to rent plants by the load. He will supply a decoration at a fixed figure, and aims to put the value into the decoration by taste in arrangement rather than quantity of material, but never rents plants by quantity. "A load of plants stood in a row is not a decoration," was a point strongly emphasized by the speaker, and he held that "decorations" of that character were a distinct injury to the trade. Plant decorations should display taste and skill in adapting the decoration to the apartment to be decorated, and for that ability a fair price should be secured, in addition to proper value for the plants used. He admitted that competition made it difficult to maintain this high standard. For years he had supplied the decoration for an annual event at one of the local clubs, for which he had received $40 each year. Two years ago another florist had secured the work by doing it for $25. He knew that the florist who now had the work could not possibly make a fair profit, and that there was a noticeable difference in the quality of the work was evidenced by the fact that when the club had recently had some distinguished visitors it had come back to him for a decoration and had paid the price he insisted upon. He felt that the competing florist had done the whole trade an injury by cheapening work which was already being done at a very moderate price. He hoped florists would see it was to their own

best interests to hold prices on decorations at a point where there was a profit in it, and not so frequently do the work at a loss with the idea that other benefits might accrue and which are rarely realized.

He liked the rhapis as a palm for decorating, and admired Pandanus Veitchii in a decoration, though it is too often injured to make it a profitable plant to so use, unless an adequate price is obtained. Crotons are pretty, but too costly to use.

Last year he found it difficult to sell palms of large size. This year more large ones had been sold, though the prices had not been as high as they should have been. Kentia Belmoreana seems to be the favorite house plant. They give the customer satisfaction for a long period and where a failure occurs it is generally found that the plant had been permitted to become practically dried up for want of water.

The average customer expects the florist to supply a new plant gratis if the first one has quickly suffered damage, and it is generally impossible to convince such customers that they are to blame in the premises. It is an aggravating condition to deal with, but he believed it wiser to suffer some little loss in this way than to have a customer dissatisfied. So long as a customer's trade is worth having at all it is worth something to hold it, and it is cheaper to hold it by making some concessions of this sort than to secure new customers during these days of sharp competition. He found that buyers do not fully appreciate the value of a palm until they have had one a year or so; then they begin to understand why a palm is an expensive plant and to appreciate it at its true worth.

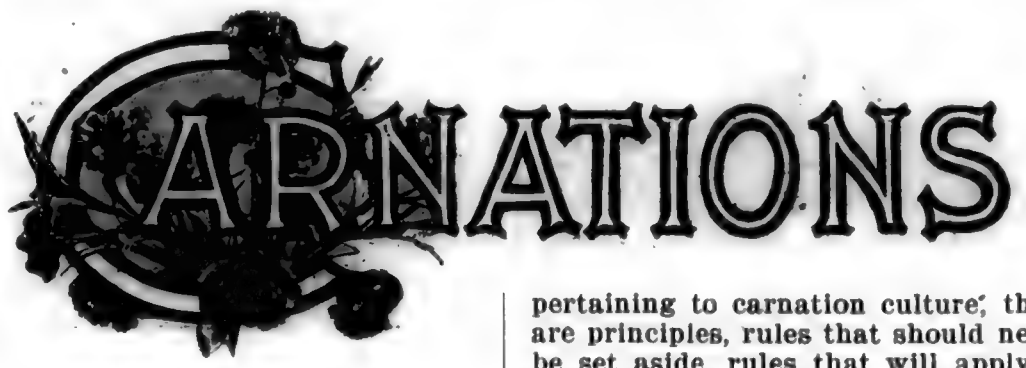
People seemed to like the decorative effect of the latania better than that of other palms, but the edges of the leaves were apt to soon turn brown and the plant be condemned on that account. He had tried Livistona rotundifolia, but it did not give satisfaction in the hands of customers. Cocos Weddelliana seemed to give excellent satisfaction. He had also tried a quantity of Areca Bauerii, but it lasted no better than a seaforthia when used as a house plant. In his opinion Pandanus utilis is an excellent house plant, and Pandanus Veitchii will give satisfaction if the customer understands how to care for it.

In ferns, Nephrolepis exaltata Bostoniensis had given splendid satisfaction to his customers. He asked: "Why is exaltata generally infested with scale, while Bostoniensis is entirely free from them? That has been my experience. I have handled about 2,700 plants of Bostoniensis and have never seen a scale on one."

Polypodium aureum has given satisfaction so far as he has tried it. He noted that the demand for fern dishes had very largely increased of late years, and believed the demand would continue to grow. People that cannot afford a regular supply of cut flowers will buy the fern dishes. But he believed that they lost the florist many sales of cut flowers.

For fern dishes he found the pteris varieties the most lasting. He noted the lack of a good variegated plant suitable to mix in with the ferns to relieve the monotony of all green foliage. He has as yet found nothing of the sort that will last well. He felt that the sales of ferns by the growers during the last two years must have been very greatly increased.

Mr. A. McAdams next spoke and called attention to Cyrtomium falcatum, which he considered the most lasting of all sorts to use in fern dishes. He found that where this fern had been used it was always the last to succumb to adverse conditions. It will stand dry heat better than any other fern, but is subject to scale. He had also found Pteris magnifica a very useful fern.



He noted that Mr. Wienhoeber had not mentioned the phoenix among his palms. He considered it the most lasting palm for the house, and thought P. rupicola, when character well shown, a very beautiful plant. He had sold many and they gave satisfaction.

Mr. Wienhoeber replied that he had sold a quantity of Phoenix canariensis, but customers had generally brought them back, complaining that the plant was too stiff in appearance. He had tried a few plants of Cycas Siamensis, and it had given very good satisfaction as a house plant.

Mr. J. T. Anthony thought there was an excellent opening in Chicago for a grower of palms, ferns and other decorative plants. He said there was never enough stock of suitable sizes and that the great bulk of the plants used had to be brought from eastern cities. He had found the growing of Pandanus Veitchii very profitable. He had retailed plants at $2 each that were only twelve weeks from the cutting, but the cutting was a strong one. In the summer time he found no difficulty in rooting the cuttings in a palm house. He potted the cutting right into the soil. He thought there was room for many more rubbers, and that they should be produced by local growers. He held that Chicago is now the greatest shipping point for cut flowers in the world, but that the production of cut flowers is being overdone. That some of the glass could be more profitably devoted to plants for which there is already a steady and reliable demand.

He noted that small ferns were nearly always cheap in the fall, but from January to May there was generally a shortage. The cause of the surplus in fall was due to the fact that the large eastern growers produced large quantities in summer, carried till fall in frames covered with canvas or other shading. He believed it was just as easy to have ferns of suitable size ready for December to April as earlier, and that good prices could always be obtained for them. He believed there was more money in growing ferns than palms.

There was quite a discussion as to the amount of capital required to start in the business of growing palms. Mr. Wienhoeber felt he would not like to start such an establishment with a capital of less than $50,000. Mr. Anthony held that an extra outlay of $500 would be sufficient to start a florist who already had suitable glass. He told of the way the eastern growers put growth on their palms during the summer months by giving bottom heat at night. The plants are kept quite moist, but never syringed late in the afternoon. Often the pots are plunged in some material retentive of moisture. Mr. Anthony believed the returns from palms would be as quick as from roses, but others seemed to feel that he was over sanguine as to this.

FIELDWORK—CULTIVATING.

Cultivating, to work and keep the soil in a condition to insure the best results, is the first work to attend to, and should not be neglected, for on it depends to a large extent the retention of moisture for the summer's hot and dry days. This work has to be kept up from now on until the plants are again housed. As in every other work, pertaining to carnation culture, there are principles, rules that should never be set aside, rules that will apply in the same way to the culture of every other plant, being universal, and still they are sometimes neglected.

In our summer culture we are dependent on the weather. Continued copious rains will render the soil untillable, and if the land has no natural drainage, it certainly should have been provided for in the preparation of the ground. But in cultivating we touch the opposite, as it is desirable

to retain a degree of moisture for the sustenance and growth of the plants in dry weather. We all know the effect of wet and dry weather on the welfare of the plants. While in wet weather the plants may make a more rapid growth, they are in danger of being affected by fungous diseases; in dry weather we notice the healthiest growth, and to preserve and retain the required moisture is the first and foremost object of cultivating.

In the so-much recommended method of sub-watering on the benches in the house, we find the surface of the soil remains in the same condition at one time as another, that is dry but loose and mellow, open to the air. But this is only on the surface; it is moist 1 or 1½ inches below the soil, being kept so by that capillary action, drawing the water up from the bottom through a layer of brick so long as there is a supply of water. Now to insure the same action in the field, to draw up the moisture from below, the surface has to be in the same condition as on the bench, loose and mellow, accessible to the air. Now on the other hand, the roots of the plant revel near the surface; there they find the most food, caused by a more rapid decomposition of the nutritious elements in closer contact with the air. So it is conclusive that we should cultivate only superficially, say to the depth of about two inches; we desire to facilitate that capillary power, without injuring the roots of the plants. To cultivate judiciously we must never touch the soil when too wet, nor wait until it becomes dry and baked. The soil should be in a condition so it can be reduced to the consistency of ashes.

The necessary rains to supply moisture to the soil; at the same time destroy our provisionary work intended to retain the same during dry weather; so it has to be renewed after every rain, as soon as the soil is in a proper condition to do it. It is poor policy to wait for another probable rain, to save the work of doing it over again; a delay will prove very harmful if that expected rain should not materialize. There is another object in cultivating, that is, the destruction of weeds, ignorantly often supposed to be the main object of cultivating, but if the first mentioned is thoroughly carried out, weeds will certainly have no chance to grow, and need no further consideration.

I mentioned in my notes on planting that I prefer hand cultivating to horse cultivating, and my reason for the same is that the horse cultivator generally runs too deep and leaves the soil in too rugged a condition to my taste, while with hand cultivating the rows can be planted closer, the same number of plants occupying less ground, consequently less to cultivate; and, as with a good hand cultivator, one man can do the work of six with hoes, there is little difference in the saving of time and labor, and besides makes better, more careful and more satisfactory work.

We use the "Gem" hand cultivator, a very satisfactory and cheap implement, and when the little shovels are worn off they can be replaced with a new set at small expense. As a cultivator will not touch the soil between the plants in the rows, this has necessarily to be gone over with a hoe, and never allow any ground to be hilled up around a plant, for this is even with deep planting and invites stem rot.

I may mention here the relative subject of watering. With a rigid adherence to the principle of cultivating, there is no necessity for watering in the field, and the results far surpass that of watering. To my experience watering has proved with me a useless, ineffective work, and at times has been a positive injury, and expensive besides. To my impression watering, during a time of drouth, will only be of benefit by a system of irrigation or better by sub-watering with the aid of tiles.

FRED DORNER.

MISCELLANEOUS SEASONABLE HINTS.

Cuttings.

You should take advantage of the last week or two of firing to put in a good batch of cuttings that may yet be useful. In our latitude there is considerable bedding out done as late as middle of June, and coleus and other quick growing bedding plants will make acceptable plants in 4 weeks.

Chrysanthemums.

Above all you should put in at once a large lot of chrysanthemums. A few varieties like Bonnaffon, Jerome Jones and Ivory should have been propagated six weeks ago to obtain the best flowers, but sorts like Niveus, Maud Dean and Lincoln can be propagated this month. Many florists will be so busy for the next 4 or 5 weeks that chrysanthemums not planted in the beds are liable to get neglected. Many will be in 2-inch pots and as shade is not at all desirable they will often suffer for water.

Although a chrysanthemum will evolve from a wiry, abused plant into a fairly good healthy growth and produce a good flower, yet it is not fair to expect that it will do this in all cases, and before you get so busy that you can think of nothing but filling orders you should try and get them in shape to withstand a month's comparative neglect. Two inch, that have the pots filled with roots, can be shifted into 3-inch, and 3-inch propagated early into 4-inch. If you don't have bench room, you will be sure to have room out of doors, and a board 6 inches deep and the beds not over 6 feet wide, with the pots plunged in coal ashes, will be just the place for them. The sun and air will give them the firmness and partial ripening of the wood, essential in many varieties, much better than being under glass, in the glaring sun and starved for root room. Whenever you can spare a bench for mums and want fine flowers, you should plant at once.

Some years ago we were told to put an inch of cow manure on the bench and 4 or 5 inches of soil on that. We did not find it a good plan. The bench should be constructed so that water will pass freely between the boards, at least a good half inch between the boards or planks. Five inches of a rather heavy loam is, I think, just as good as 10 inches and more easily managed. A fifth of half decomposed animal manure and one quart of bone flour to 2 bushels of soil will be an excellent mixture. I will just add that they are often planted needlessly far apart. It is a waste of most valuable space and of little benefit to the plants. The rows nine inches apart and the plants 6 inches from each other will grow just as fine mums. as you are likely to get a demand for. If you intend to have 2 or 3 flowers to a plant then 10 inches between rows and 8 inches between plants will be sufficient.

Hydrangeas.

There is always a good demand for these every spring. As an Easter plant we don't think them quite so satisfactory as many other plants, but if wanted on that occasion you may as well have them as to buy them. For Easter sales cuttings should have been struck as early as end of January and be now in 3-inch pots. When well rooted in these, and having made a growth of 4 or 5 joints they should be stopped by pinching out the center growth. Towards end of month they should be shifted into 6-inch pots or

at least a 5-inch, and plunged in some convenient material out of doors in the broad sun. They will make a strong growth and develop strong eyes that will give you fine flowers next spring. These plants ripen their wood and flower much better than those planted out, but for selling at this date and later the young plants are just as well planted out, and are much less trouble. I noticed last year a few dozen planted out in a deep, rich black muck, rather wet subsoil, which made a tremendous growth; that was hardly desirable. A good loam is the best, but it is well to have them within reach of the hose in case of a very dry time.

Geraniums for Winter.

The plebeian geranium is little grown now except as a flower garden plant, and for that it is a universal favorite, but as a fall and winter flowering plant it is still useful and frequently asked for. To have useful plants that will produce good flowers you should select some medium strong, young plants; strong shoots should be stopped and all flower buds kept pinched off. If they are in 4-inch pots now, by middle of June they can go into 5-inch, and later into 6 or 7-inch. They could be grown under glass all summer without any shade, and their pots plunged to the rim to keep them from drying out over much, or they could be plunged outside with just as good results, only in case of several days of heavy rain they get water soaked, and that means yellow leaves. If the buds are kept picked off all summer the plants will be anxious to bloom and will flower profusely whenever you choose to let them. Only grow the doubles, or more correctly speaking, the semi-double. Of all varieties that made a good pot plant F. S. Raspail was the best. Mr. E. G. Hill is sending out an Improved Raspail that must be a dandy.

A Useful Spring Flower.

When wandering on the banks of the Delaware two weeks ago I saw a showy yellow flower, it was doronicum. They have been grown in gardens for many years, but this one I saw was not generally known. It is perfectly hardy, grows in any soil, easily divided, and is the earliest of all of our hardy herbaceous plants. It was in flower with us on May 1st, and 7 degrees of frost had no effect on it. It may be coarse, but it is a useful yellow flower, and its extreme earliness makes it quite desirable.

I may be allowed to say that seeing it at Riverton in full flower the end of April I was bound to buy a few. On returning home and going over a little farm, where I have an acre or two of herbaceous plants, I discovered that I had rows of this plant 200 feet long. There is no particular moral to this tale, only it's as well to know what you own before you go off buying. If there is any room for it this doronicum would force most easily. The species or variety I have is "Harper Crewe." I found the flowers wilted the first few hours after cutting, as tulips do, but they scon stiffened up in water.

WM. SCOTT.

THE FLORISTS' REVIEW

G. L. GRANT, EDITOR AND MANAGER.

PUBLISHED EVERY THURSDAY BY

THE FLORISTS' PUBLISHING CO.

520-535 Caxton Building, Chicago,

334 Dearborn Street.

Eastern Manager:

HARRY A. BUNYARD, 56 Pierce Building, New York. 105 Hudson Street.

Subscription, $1.00 a year. To Europe, $2.00. Subscriptions accepted from those in the trade only.

Advertising rates: Per inch, $1.00; ⅛ page, $13.00; full page, $25.00. Discounts: 6 times, 5 per cent; 13 times, 10 per cent; 26 times, 20 per cent; 52 times, 30 per cent. Discounts allowed only on consecutive insertions. Only strictly trade advertising accepted. Advertisements must reach us by Tuesday to insure insertion in the issue of the following Thursday.

COPYRIGHT 1898.

CO-OPERATION.

If you are in the trade and are not yet a subscriber to The Florists' Review, send in your name and one dollar now and you will receive not only The Florists' Review for one year, but also a certificate entitling you to the earnings on one dollar's worth of stock in the Florists' Publishing Co.

Why do we make such an unparalleled offer? It is very simple.

You will have an interest in the success of the paper.

You will see that you can buy everything that you want to just as good advantage from advertisers in the Florists' Review as elsewhere, and at the same time benefit yourself by increasing the earning power of your certificate.

This mutual arrangement cannot fail to bring to the paper a heavy advertising patronage, and as a result the stock represented by your certificate will earn good dividends.

And the more you buy of advertisers in the Florists' Review (always mentioning the paper) the larger your dividends will be.

You get the best paper in the field and a share of its earnings.

Send in your subscription now. Address the Florists' Publishing Co., 520-535 Caxton building, Chicago, Ill.

AMERICAN CARNATION SOCIETY.

We have received from Secretary Herr a printed copy of the proceedings of the seventh annual meeting of the American Carnation Society, held in Chicago last February. It contains a full and complete report of all the proceedings, including a stenographic report of the various discussions, and is very interesting reading. The pamphlet is well printed and bound and is a credit to the society.

A copy of the report is sent to all members of the society. If you are not a member, and are a grower of carnations, you should join the society and secure a copy of the report. The membership fee is $2 a year, and applications should be addressed to Albert M. Herr, Secretary, Lancaster, Pa.

CHICAGO.

Club Meeting.

Last Friday evening the Florists' Club held its first meeting in the new quarters in Handel Hall building, 40 Randolph street, and the members were well pleased with the new accommodations. No less than sixteen new members were added to the roll, the largest number ever elected at one meeting. Following is a list of the new members: Archie Spencer, John Zeck, A. C. Kohlbrand, Geo. Asmus, Harry Rowe, Oscar Kreitling, Chas. S. Stewart, L. P. Kelly, Wm. Kyle, Geo. Anderson, Chas. W. Ernie, J. Johnson, E. Clifford Pruner, A. Irolson, Jos. Holy and A. Chester Sedam. The last named is of Zanesville, O.; the others are all of this city.

The subject for the evening was "Palms, Ferns and Other Decorative Plants." A full report of the discussion appears elsewhere in this issue.

The next meeting will be held the evening of Friday, May 20. The subject for discussion will be, "Sweet Peas and Plants for Summer Blooming."

Bowling.

After the club meeting last Friday evening the bowlers adjourned to the alleys and played two warm games. There were three teams of six men each, and the team captained by Ed Winterson won both games, but the high score (188) was made by Robert Schenk, captain of another team. Following are the scores:

Ed. Winterson	135	133
Oscar Kreitling	135	153
A. C. Kohlbrand	112	105
Geo. Stollery	142	96
—— Campbell	123	138
Chas. S. Stewart	102	99
Totals	749	724
Robert Schenk	113	188
Chas. Held	139	124
A. Lange	81	106
Chas. Balluff	153	106
Wm. Kyle	72	114
S. Snedeker	73	80
Totals	631	718
C. W. McKellar	135	121
G. L. Grant	156	140
Fred Hills	105	128
John Degnan	89	89
A. McAdams	150	71
T. F. Keenan	82	95
Totals	717	644

The second score credited to A. McAdams was made by Jas. Hartshorne, who took the former's place after the first game.

The bowlers will now meet for practice every Friday evening at the alleys at 77 Randolph street, and with

Designs at the funeral of Lieutenant Jenkins, at Pittsburg.

regular training some good scores may be looked for. All games will be played exactly as if a tournament was in progress, and all fouls promptly called. At the games last Friday some players were very much surprised to be called down for very slight infractions of the rules, and they will be more careful in future.

The Market.

Conditions in the wholesale market are much better than last week. Last Saturday things brightened up very considerably and prices stiffened up remarkably. The improved conditions were very well maintained Monday. Prices on tea roses range from $2 to $5, the bulk of the stock being marketed at $3 to $4. Good carnations all seem to find sale at $2, except in red, of which there is a surplus. Still good flowers of Jubilee go as high as $4 and other special fancies go at even higher prices.

This has been a season of remarkable fluctuation in prices, the sudden changes in values being at times quite startling.

City trade has been very flat of late, but outside demand has averaged very good, or the growers would have suffered severely.

All the dealers look forward to an unusually good trade for Decoration Day, owing to the military spirit that has been awakened among the people by the war.

Various Items.

Flint Kennicott and O. P. Bassett have returned from their sojourn at the West Baden springs.

E. H. Hunt is now strong enough to visit his place of business, but is still far from strong.

J. A. Budlong's wholesale store will be at 37 and 39 Randolph street. His son, A. H. Budlong, will be manager, and he will be assisted by John Zeck, formerly with Reinberg Bros. and more recently with S. B. Winter. The store will be open for business next Monday.

P. J. Hauswirth recently made up a very handsome wreath of orchids of which we secured a photograph and will soon present an engraving.

C. W. Northrup is sending to Kennicott Bros. Co. flowers of a very handsome yellow tulip, which is called the "Lily Tulip" for lack of another title. The petals are recurved and at a short distance the flowers look very much like a small yellow lily. They take well in the market.

E. H. Hunt recently received a large shipment of wheat and is making up a great number of sheaves. He finds a constantly increasing demand for well made sheaves. Mr. Hunt carries as full and complete a line of florists' supplies as is to be found in the West, and his growing business testifies to an appreciation by the trade of his unfailing courtesy and uniform fair dealing.

Arbor day was most appropriately celebrated in Humboldt Park by the planting of a host of trees by over 2,000 school children. There was an excellent program of speaking and singing in addition to the tree planting, and Superintendent Jensen was much pleased with this first attempt at a proper observance of the day at this park.

E. C. Amling is sending his customers some neatly designed hangers, one containing some patriotic business literature with the American flag in colors, and the other giving the telegraph code.

Recent visitors were A. T. Boddington, of Clucas & Boddington, and Mr. Henry, of Henry & Lee, New York.

President Gude and Secretary Stewart, of the S. A. F., passed through Chicago yesterday (11th inst.), en route for Omaha to make final arrangements for the convention in August.

FUNERAL DESIGNS.

The accompanying engraving is from a photograph, at the funeral of the late Lieutenant Jenkins, of the ill-fated warship Maine, which took place at Pittsburg. The picture shows a number of designs by Pittsburg florists.

At the head of the grave is seen a model in flowers of the battleship, which was arranged by Gustave Ludwig. At the left is a large standing piece arranged by Langhans & Co., and at the right one by Elliott & Ulam. An anchor rests at the foot of the grave.

A detailed description of the three large designs appeared in our Pittsburg notes on page 780 of our issue for April 7.

NEW YORK.

The Club Meeting.

On Monday evening, before the members of the New York Florists' Club were called to order, an impromptu concert was held in which patriotic airs were indulged in to commemorate the victory at Manila, proving that florists have well cultured voices as well as plants and patriotism. Professor Carnation Rosea Violacea presided at the organ.

President Plumb was in the chair and explained that the small attendance was due to the drafting of recruits, many of the craft having gone to Chickamauga and to Camp Black.

After the reading of the minutes the exhibition committee reported that they had met the president and secretary of the New York Gardeners' Club and had conferred with them with regard to holding a joint fall show. The committee reported progress and it was referred back to them to secure more definite information.

A letter was read from the Educational Alliance, inviting the club to hold an exhibition at their own hall during the month of May or June. After considerable discussion it was evident the notice was too short, and the secretary was instructed to so inform the association.

The following gentlemen nominated at the last meeting were then elected: H. A. Kettle, Seabright, N. J.; L. C. Bobbink, Rutherford, N. J.; D. H.

Van Horn, New York city. Adolph Fisher, Great Neck, L. I., was nominated.

The president then introduced Professor Britton, of the Connecticut Agricultural Experiment Station, who gave a very instructive and interesting lecture on "Experiments with Chemical Fertilizers on Greenhouse Plants." The most noticeable fact brought out was an experiment with chemical fertilizers and their effect on carnations. The most satisfactory was from plants grown in coal ashes and peat moss, with the following added: Three lbs. 14 oz. nitrate soda, 1 lb. 1 oz. dissolved boneblack, 1 lb. 13 oz. muriate potash; 3,384 flowers were taken from 100 square feet, or an average of 27 3-10 per plant. Prof. Britton showed several interesting photographs comparing the effects of chemicals on the root and plant action.

Mr. Herrington, in the discussion that followed, thought that the lecture as a whole showed a negative rather than a positive result, and suggested that as Mother Earth had rarely gone back on us he was inclined to think we should not go back on it. A hearty vote of thanks was accorded Prof. Britton.

The essay committee announced that Prof. Elson, of Boston, would be the next entertainer, his subject being "Music and Flowers." They also suggested, as the next meeting would be the last this summer, it should be "ladies' night," and it was unanimously adopted.

On a motion it was unanimously resolved to send a letter of condolence to the family of James D. Burnett, a member of the club, and the secretary was so directed.

The Exhibit.

W. A. Manda showed three seedling Rex begonias very distinct, and a very distinct and new oncidium like Cavendishi undoubtedly a natural hybrid.

In the Market.

The market still continues lifeless, in spite of a considerable lightening of crops, inclement weather and the present international question both contributing to this state of things. To-day, Monday, as I write, however, there is a slight improvement.

Prices remain about the same as last week, with comparatively little change. Some very fine Cattleya Mossiae are being sent in by Mr. A. Herrington, Madison, N. J., and realize 60 cents apiece.

With the summer ahead of them the two Macs, MacDonald & McManus, are in a quandary as to which shall go to the front. They will draw lots next Friday, the 13th.

Obituary.

We are sorry to announce the death of Mr. James D. Burnett, Madison, N. J., last Saturday morning, from consumption of the throat. Mr. Burnett was ill but two days, though he has been ailing for some time. He was a member of the New York Florists' Club and Royal Arcanum, and was well known and liked among the fraternity.

Notes.

Among the visitors were: Robert Craig, William Craig, Philadelphia; Geo. T. King, Hyde Park, Mass.

Mr. Chas. Weathered has been under the weather with grippe, but is now fully on the way to complete recovery.

BOSTON.

Review of the Market.

There has been but little change since my letter of last week, with perhaps the exception of carnations, which are somewhat more plentiful and are selling readily, common stock averaging $2 per 100, while strictly high grade flowers still bring good prices, and are bought up on sight.

Roses are of fine quality for this season of the year, but the supply is in excess of demand, prices ranging from $4 to $10 per 100, while hybrids, of which some very fine Jacks and Brunners are coming in, are cleaned up fairly well at from $1 to $4 per dozen. Quite a few of that old favorite, Souvenir de la Malmaison, are in the market, and sell well, from $1 to $2 per dozen. Some very fine valley, grown in cold frames, is seen, and brings $3 per 100, a few being sold for $4.

The demand is light for violets, 50 cents per 100 being the ruling price. Bulb stock of all kinds is at a discount, while odds and ends, such as spiraeas, stocks, candytuft, etc., are readily taken up by retailers, at prices ranging from $1 to $2.50 per 100.

The Banquet.

The annual banquet of the club took place at Horticultural hall, Tuesday evening, May 3, and was a great surprise to the members, the number present being nearly a hundred, or nearly double the average for the past few years. After a short business meeting the president invited everybody into the lower hall, where the sight of the long, well-filled tables was a feast for the eyes, as well as a creator of a ravenous appetite.

The decorations were planned and carried out by the president, Mr. Geo. Anderson, of Milton, and while they were not elaborate, were very tastily arranged, and the mounds in the center of each table, filled with small American flags, at once aroused the patriotism of all the guests, everyone conceding it to be the most appropriate part of the table decorations.

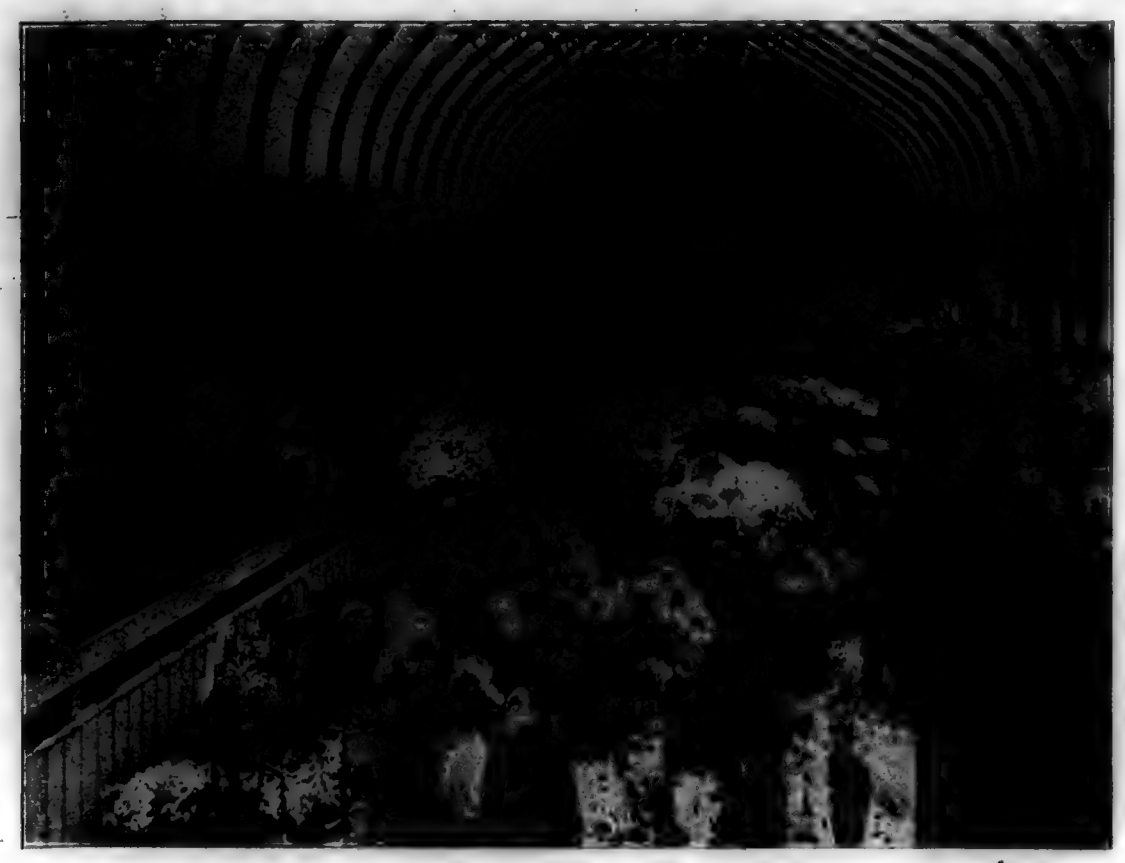
When the inner man had been satisfied and cigars were passed around and lighted, and each guest had been "buttonholed" with a flag, the president welcomed the guests, and introduced ex-President A. P. Calder as toastmaster, who, in accepting the honor, made one of his own characteristic speeches, which was well received.

Mr. F. L. Harris, of Wellesley, one of the pioneers of the private gardener's craft of this country, was the first speaker called upon. Then came John Galvin, the oldest commercial florist in New England and one of the foremost to start a flower store in the United States.

Mr. George Spaulding, a guest of the club, then favored us with a fine old Irish cradle song, brogue and all, which was the hit of the evening.

After the song Mr. Peter Barr, "the Narcissus King," from London, Eng., was introduced, and gave a very entertaining account of his cordial reception in this country, stating that almost immediately on his landing he had been decorated with the national colors by one of our well known English-American florists.

This gave the toastmaster his cue for the next toast— the "Stars and Stripes," the emblem of the most glorious nation in the world—and every man present, American, English, Scotch, Irish and German, arose and drank (water was the beverage) to "Old Glory" and joined in singing the "Star-Spangled Banner."



Mr. Lawrence Cotter, after a little persuasion, made a few remarks, during which he called for three cheers for Commodore Dewey, a glorious representative of a glorious nation, which were given with a will.

Following a patriotic song by Mr. Joseph Mahan and the reading of letters of regret from President Kidder, of the Horticultural Society, and Professor Watson, Mr. Spaulding again favored us, this time with a comic recitation.

Mr. Calder then introduced Mr. Warren Ewell, after which Mr. W. W. Tailby and Mr. W. H. Elliott, of the New England Florist, responded for "The Press." Mr. E. H. Hatch and P. Welch were called upon, but had quietly left the hall. Mr. Spaulding then favored us with another song, after which everybody arose and joined in singing "Auld Lang Syne."

The May Exhibition.

The usual May exhibit of the Massachusetts Horticultural Society was held in the lower hall on Saturday, May 7, and could well be called a "Calceolaria exhibition," grand specimens of which were exhibited by Mrs. B. P. Cheney, who captured first and third prizes on collections of six varieites, and third on specimen plants. Dr. C. G. Weld was awarded second prize on collection, while I. S. Bailey received first prize for a magnificent specimen of a clear yellow variety, and fourth on collection. E. S. Converse got third on collection. Dr. C. G. Weld captured all the prizes for azaleas, showing some excellent plants for so late in the season.

Easter Display in the Show-house of Mr. E. Wienhoeber, Chicago.

The Joseph S. Fay estate made a fine exhibit of pansy blooms, being awarded three prizes and a gratuity. N. T. Kidder showed pelargoniums and received first prize. Edward J. Mitton, of Brookline, was awarded a gratuity for a fine specimen hanging plant, Citroderia Fulgida. He also exhibited a well-grown plant of a very old favorite, Saxifraga sarmentosa.

J. E. Rothwell exhibited a plant of the exquisitely colored Phalaenopsis Harrittae, originated by crossing P. grandiflora and violacea, and supposed to be the only plant of this variety in America. A single flower of a seedling Cypripedium Lawrenceanum, exhibited by C. G. Roebling, Trenton, N. J., was awarded a certificate.

The usual exhibit of seasonable wild flowers was made by Mrs. P. D. Richards and others.

Wm. Nicholson, the carnationist of Framingham, received a prize and a gratuity for tomatoes, which he grows as a crop to succeed chrysanthemums.

News Items.

The stallholders of the market are exhibiting their patriotism by decorating the ceiling and columns with bunting and flags.

The creditors of Geo. Mullen, who did business under his wife's name as L. Mullen, have most of them signed a paper accepting twenty-five cents on the dollar.

C. J. Harvey, florist, of Highlandville, has gone out of business.

Mark Harris, who failed directly after Easter, is offering his creditors 25 cents, but is doubtful if they will accept it.

W. J. Kennedy, former manager of the market, has been appointed assistant to Supt. Doogue, and will be in charge of Boston Common.

The store fittings of the late firm of L. J. & W. J. Doogue will be sold at auction on Tuesday, May 10, by N. F. McCarthy. They originally cost $5,000.

Among visitors to the Hub this week are G. W. Smith, of Fall River, Mass., and Mr. Herrman, of basket and metallic design fame, of New York. P.

BUFFALO.

Supply and Demand.

There is nothing very new in the horticultural little world in which we revolve. One more new store on Main street. The proprietor of the store, which Mr. W. A. Adams vacated on the 1st, must have seen a delegation of stalwart policemen giving "Andy" an order for a badge or button occasionally for a defunct copper, and doubtless thought it was all profit, so he has started in. It's a pity; they are certainly too thick on our chief thoroughfare.

Mr. Kasting reports roses plentiful, but carnations he could dispose of in much larger quantities. Messrs. W. J. Palmer & Son have a brilliant show in their window nowadays, a change almost every day. The last time I saw it, it was 500 Meteor roses and 2,000 Daybreak carnations.

J. H. Rebstock makes a tasty show with large vases of Beauty roses and a fine lot of well-grown gloxinias.

S. A. Anderson has been East, and we shall doubtless see the result of his journey very soon.

Carnation Genesee.

I must beg permission to say just another word or two about our favorite carnation Genesee. I wish all my friends could see it. A bed 125 feet long and 7 wide; not one plant died at transplanting time; not a dry or yellow leaf has been seen, and from November it has been steadily producing, but never looked as it now does; flowers and buds standing up like a field of wheat; not a bursted calyx to be seen. One thing about this carnation, it is of all varieties I have yet seen the easiest to support, but I am going to have the bed photographed and let you see. This little outburst of praise for a crop of my own is merely because I sincerely admire it and am proud of it. A real gardener admires his products aside from the pecuniary view. Ladies often remark "How you must enjoy your business among these beautiful flowers," and for a joke they get the reply, "Yes, ma'am, we can see the dollars sticking all over them." But this is not so. A true gardener and good (?) man would like to get the dollars and leave the flowers nodding in their beauty on the plants.

A Visit to Philadelphia.

In company with our retired florist, the noble Dane, C. F. Christensen, and Wm. S., we found ourselves some ten days ago trying to get into an upper berth of a Lehigh Valley sleeping car with the assistance of the porter, and to the great annoyance of the man below we at last got to our respective resting places. It is not far from the Grand Reading depot to Green's hotel, where you would be hard to please if not suited with their layout in any line that a traveler is looking for.

No. 714 Chestnut street is just across the road, and half an hour's chat with Mr. Wm. Dreer was very enjoyable. The ferry runs frequently and so does the train, and in a few minutes you are at Riverton. It is six or seven years since I was there; what a change! I am not going to attempt to write up all I saw, but it is really a wonderful place, and how to build and heat palm houses seems to be not only solved but brought to great perfection. Two acres of Kentia Belmoreana and other things in proportion will give one a good idea of the extent of the place.

As an attractive sight for a visitor I think the lily ponds would please the majority. The two or three acres of well-kept lawn, as level as a tennis court, and dozens of the sunken, oblong ponds or tanks, each devoted to a species or variety, is also a sight worth seeing. The sight in July or August must be absorbingly beautiful. The impression of this vast quantity of nympheas of every shade, especially in the dewy morn, must be solace for the most wearied soul. No wonder Mr. Eisele said, "When tired and wor-

ried with business, I seek comfort by a walk round among the water lilies." Great expanses of brilliant flower gardens we have seen, and are to be seen in many places, both here and in Europe, but such a water garden as this exists nowhere else on earth.

Presiding over this great collection of aquatics you would expect to see a graceful nymph or mermaid, clad in a leaf of Victoria Regia, with a rod of papyrus in her hand. Don't have any such vision. You will see 200 pounds of solid meat, with black beard and jolly red face, lighted up with a genial smile, and if that smile is mixed with honest pride over his pets, no wonder. The man is Mr. Tricker, and this wonderful collection is the result of his love and enthusiasm for these gems of the floral kingdom.

From Riverton to Chestnut Hill is quite a step, but we were on the jump and only stopped when friend Christensen got dust in his throat. We found the genial Edwin at home, but John had gone away to indulge in the pleasure of breaking up Peoria blackbirds. Well, if I were cutting as many fine Beauties as he, I would shoot at blackbirds at least twice a week. The roses, particularly Beauties, both at Mr. Lonsdale's and Mr. Burton's, simply could not be surpassed. They are masters of their business, live in fine houses, and are jolly good men, and friend Lonsdale is to be only censured for one thing. He has absorbed enough good nature to bless half a dozen men, and so others go short.

The Lafayette hotel is a good place to stop and near many of your friends. Mr. Pennock's busy commission house was visited; so was Pennock Bros.' fine store, but Mr. Cartledge we unfortunately, for us, missed. We nailed Mr. Robert Kift all right, and then an hour's ride landed us in Baltimore.

At Baltimore.

We were no strangers there, but it never struck me so forcibly before that Baltimore is a very large and important commercial city, but for all that very old fashioned and in our small line very much behind the day. The streets cannot be very dirty, because there is such a descent or ascent to them that they get washed clean at every shower. The vulgar, obtrusive soliciting of the hackmen and touts at the union station would disgrace a mushroom town. The street cars are rickety, dirty, bumpy affairs that will produce congestion of the liver, preceded by seasickness.

The florists are all huddled together in two or three blocks, and the first one that starts a real modern store in the residence district (and Baltimore has some beautiful resident districts of the kind) will make a strike. Mr. Halliday and that most pleasant lady, Mrs. Thomas, we met, but Mr. Seidewitz, Mr. Pentland and Mr. Feast were not in to receive our brief visit. At breakfast in the old Eutaw house we had a call from a most gentlemanly man, a Mr. Sands, who has lately joined the noble army of florists. We wish him great success, and greatly appreciate his kind words, and only would wish that he had embarked in business in a better market.

The Capital City.

It is only a good cigar smoke from Baltimore to Washington. We did a lot in six hours. There was the Botanic Garden to see, but the principal thing about that is W. R. Smith. More time was spent looking at a genuine Kilmarnock edition of Burns than all the plants. Then Mr. Smith brought in something that he said was 16 years old. It also came from Scotland, and Mr. Christensen said: "My dear boy, this is too good to drink—it should be sipped with a spoon."

Three little speeches by three big congressmen were listened to. The republicans had their innings and the gist of their talk was that this was no time to bring up the income tax proposition. The few republicans that were not asleep feebly applauded at the end of each little oration, while the democrats read the papers, chinned away in groups or mostly went out to see a man, all as indifferent as to what the members were saying as a 17-year-old girl in church.

We just caught sight of the president as he jumped from his carriage into the White House, but what was of more consequence, we quite caught Mr. Pfitzer, who so ably presides over the garden and conservatory of the White House, and it was very enjoyable for a short while to talk to a man of his build.

Then a call on Mr. Small, whose store is a grand one, and to wind up we found our hearty, jolly friend, Joe Freeman, who has a fine place. Mr. Freeman speaks and writes straight from the shoulder, and is to be highly commended for it; honesty and candor first; consequences after.

Now all this pleasant four days' jaunt, and it was pleasant throughout, even to the dinner in the dining car on our return, when we were hundreds of feet above the city of Wilkesbarre, but took an hour to descend the mountain, all this pleasantness is marred by the many calls we could not make and many friends we could not possibly see. Whether they are just as well pleased or not, I can't say. I regret that opportunity forbade the pleasure to us. W. S.

PHILADELPHIA.

Review of Trade Situation.

The rain came down upon us every day last week; that makes twelve out of fourteen days rainy. Business was quiet last week. If the cold, wet spell ends this week, bedding plant business will begin in earnest. So far only hardy roses and pansies have fallen to the florist's share, unless he deals in nursery stock. There are many orders for cannas and geraniums waiting to be sent out. The parks and some of the large suburban hotels have very handsome beds filled each season. Some of the large private places have greenhouses of their own, but most of them depend on the growers of bedding stock, who are now expecting their busiest time of the year.

Cut flower prices ruled about the same as for the past two weeks. The supply is not so heavy as usual for the first week in May, with demand fair.

Club Meeting.

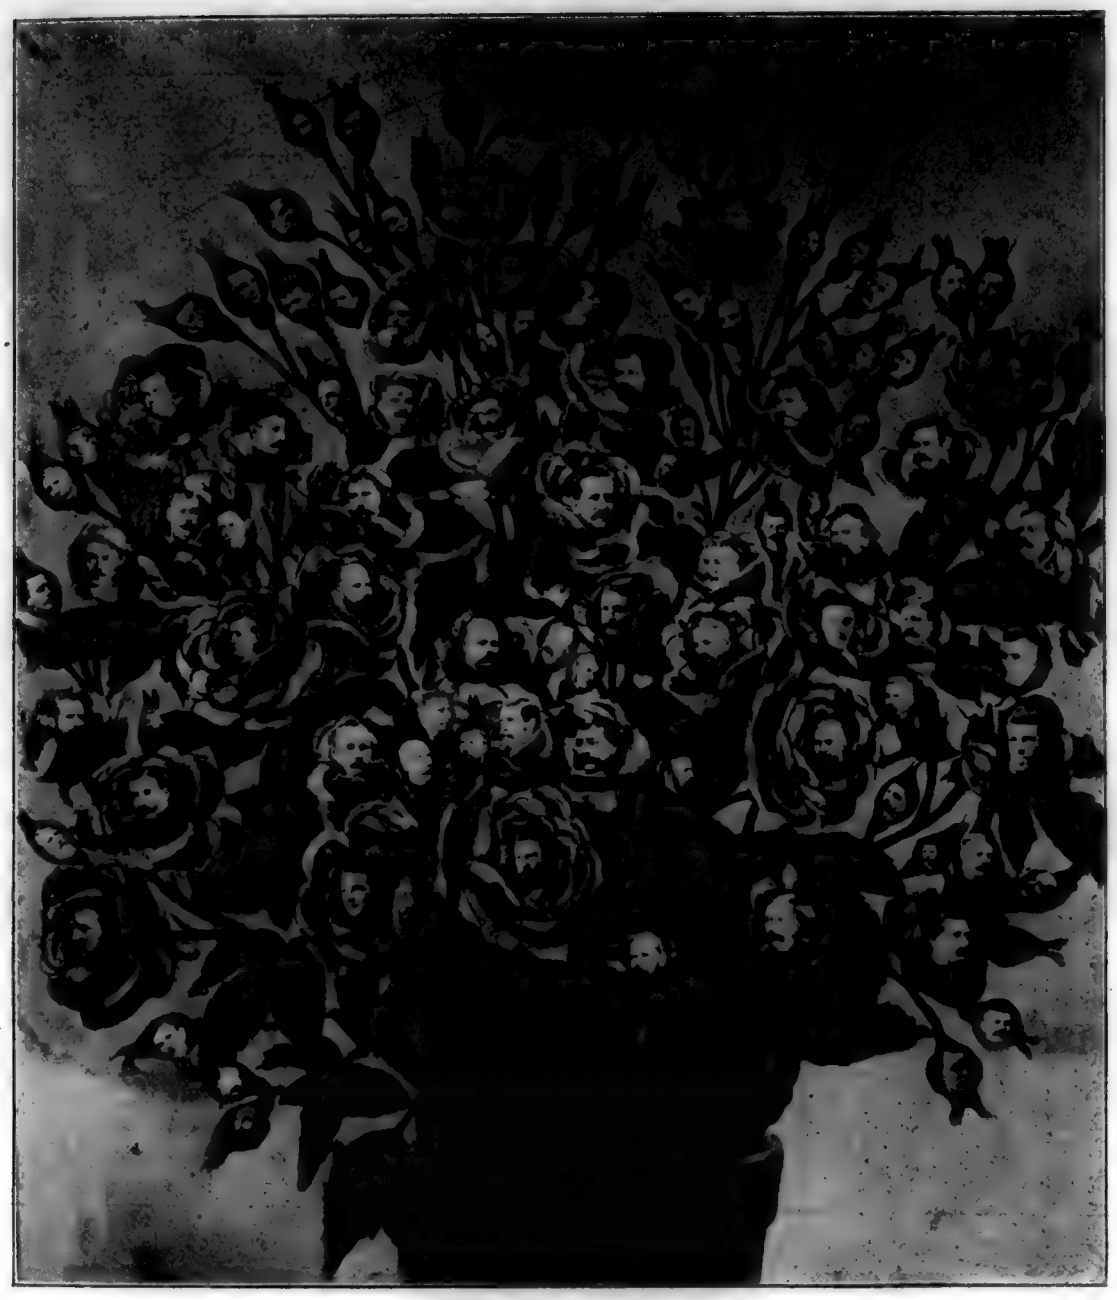
The vice president, Mr. Westcott, presided at Tuesday evening's meeting of the Florists' Club. The arrangements for the theater benefit and May party were discussed.

Mr. Heacock was to have opened a debate on paeonies, but Mr. Heacock didn't come, neither did the paeonies. We hope for both next time.

I was greatly interested at this meeting in learning the views of some of those who believe it impracticable to secure a guaranty of freedom from disease with our lily bulbs. It seems the seedsmen and importers very naturally fear they won't get their stock if they attempt to get a guaranty. To my surprise, many of the growers share that feeling. This is one of the cases pointed out by Julius Roehrs, of Carlton Hills, where growers could benefit themselves by working together. What folly to go on buying bulbs that you know are unhealthy, in the hope that may be luck will be with you and you won't have much disease. Insist on a guaranty. Ten to one you will get it, and if you don't you will be richer next Easter growing something else; for that disease will get worse unless those Bermuda growers wake up.

Notes.

A. Fahrenwald now intends building one more house, four in all.



John W. Pepper is to build one greenhouse shortly. Mr. Pepper is one of our wealthy citizens. Last season he spent a large sum of money on his sunken gardens near Jenkintown.

It is also said that Peter A. B. Widener intends tearing down his fancy greenhouses and erecting two houses in commercial style on his handsome place near Cheltenham.

Henry Diehl, of Germantown, has some exceedingly fine pansies, large flowers, good color and stems so long as to suggest a commercial future for such stock. Mr. Diehl imported the seed from Germany five years ago and has improved the stock a little each year since then by careful selection of seed, using only the first flowers for that purpose.

Chester Davis, the well-known gardener and fruit expert, has joined the ranks of the benedicts.

Immediately after The Review's last report, a secret meeting of the bowl-

Mr. Beneke's Dream.

ing team was held. The following resolution was offered:

"Whereas, The highest degree of excellence in any sport is only attained by those able to devote their undivided attention to that sport; and,

"Whereas, Florists are workers, not sports; therefore, be it

"Resolved, That this club will not win the Bowlers' League tournament of 1898."

After some discussion this resolution was adopted by a unanimous vote. N. B.—The Review is the only paper to secure the above important information, which explains some things which required an explanation.

J. W. Y.

MR. BENEKE'S DREAM.

Mr. J. J. Beneke, of St. Louis, is very fond of roses and also of his fellow craftsmen. One night, after a very pleasant gathering, he had a dream that pleased him much, and at the first opportunity he had an artist paint it for the edification of his friends in the trade. The accompanying engraving is from a photograph of the painting, and is much reduced in size.

Probably no rose plant ever before produced such a crop of flowers, either in quantity or quality.

ST. LOUIS.

The Market.

The weather has been quite cool the past week, which checked the great glut of roses that was promised, but the cold snap did not seem to have any effect on carnations. Everything was plentiful and most of the stock good.

The market did not show much improvement, although the glut was not so great. Prices on roses only showed a slight improvement. Trade in retail circles was a little better, there being quite a lot of funeral work going on, creating a demand for white stock.

Roses opened up this morning (Monday) at from $3 to $5, Brides, Meteors, Maids and Carnots bringing $4; prime stock, $5; Perles and Woottons, $3; seconds, $1 and $2. Some fine Beauties were sold at $2.50 per dozen the past week, though the prevailing price was about $1.50. This week prices on Beauties will go up.

Carnations arrived in great quantities, more than could be disposed of, and sold as low as 40 cents per 100 in 1,000 lots, but this morning they seemed a little scarce, the price going up to $1 for general stock; selected fancies, $1.50 and $2.

Harrisii and callas could be bought very cheap, as they were and are now quite a glut; $4 is the average price for the very best. Sweet peas are not so plentiful, the supply being short of demand; price, 75 cents. Out-door valley is beginning to arrive and sells at $2.

Ferns are still very scarce and smilax has been in great demand at $15. Charlie Kuehn has promised the florists to have plenty of ferns by the first of the week at the same old price, $1.75 per 1,000.

Plant trade the past week has been quite dull, owing to the cold and rainy weather.

Notes.

General Supt. of Parks Wm. C. Pape has designed a "Remember the Maine" floral piece which will be placed in Forest Park. The plans will be carried out just as soon as Commissioner Franklin Ridgely returns from the East, where he went to visit his son, Ensign Ridgely, of the U. S. Navy.

Ernest Tesson, with Ellison & Tesson, has gone with the soldiers to camp at Jefferson Barracks. Ernest and Bob are members of the Battery. Bob could not be spared from the business, but says that if called upon to fight he will be where the bullets are the thickest—"under the ammunition wagon."

Wm. Bouche, superintendent of Missouri's exhibit at the World's Fair, will build a palm garden in the Coliseum this summer, to be ready for the opening of the exposition early in September.

Miss Flick, of Fort Wayne, Ind., sent to this market last week some splendid carnations, especially the Bridesmaids and Mme. Albertini.

Max Herzog's loss of 1,000 feet of glass was not due to hail. The storm blew down his smoke stack, thus causing the loss of glass. Max says it did hail, but not strong enough to break the glass; thus the report was circulated that his loss was by hail, as stated in The Review of last week.

Club Items.

The Florists' Gun Club is soon to begin practice, so as to be in good trim when they meet the Eastern cracks at Omaha next August. The club will, as usual, practice at Tesson's place.

The Bowling Club will, after the May series, select a team to represent the club at Omaha, and as a great many of the members have expressed their intention of going a good team

can be made up that will be heard of when the match takes place. All we hope for is that our friends Scott, O'Mara and Anderson will bring along their best men.

The flower store known as Thatcher's Palm Room, which was opened by Fred Foster a few months ago, has closed its doors. Mrs. Thatcher has all the experience, but no money.

Kunz, Helwig and Beneke were a tie for first honors at bowling Monday night, 131 each; Kuehn and Beyer a tie for second, 124 each. Four games were played. J. J. B.

ROCHESTER, N. Y.

White flowers continue rather scarce, owing to a continued heavy demand for funeral work. Quite often some difficulty is experienced in hunting up a bare sufficiency in this line at present. The cloudy, dull and rainy weather, which prevailed last week, was very unfavorable for the opening of roses and carnations, and consequently none too many were in town.

Some of the roses are not so good now as they were two weeks ago; mildew is doing the injury, but those coming from Walt. Salmon are as fine as ever. He was cutting large quantities every day during the dull spell, and had no trouble in disposing of all at an advance over last week's prices. The daily cut however, is diminishing now, still as the plants are in vigorous growth, showing plenty of buds, it will only take a week or ten days of bright sun to make them bloom as freely as ever.

Geo. Arnold's sweet peas are really excellent now. The flowers are of unusual size and substance and have been plentiful for the past month. He still brings in some fine, dark, long stemmed English violets, which sell readily.

The sales in bedding plants are increasing fast, the quality is good, but an oversupply is on hand. Planting out carnations and violets is nearly finished. We never had more favorable weather for early planting than this year, and nobody was slow to take advantage of the opportunity for an early start.

Though for a week past the air was raw and cool, the trees and shrubs are now nearly all out in leaf, and the nursery trade is about over. The season has been a remarkably good one, especially in the ornamental line; stock in many instances was completely cleaned out, and nursery men in our section are, as a rule, well satisfied with this spring's sales. K.

TORONTO.

Roses are about as plentiful as the dandelions, and the price would do little more than pay for the picking. Thousands have been cleared off down at the market these last two Saturdays.

The market plant trade has been pretty brisk, too, quite a lively business being done in herbaceous plant roots and other of the hardier plants. Next week and after bedding plants will begin going off in quantity.

Most of the carnations will be planted out by the end of this week. Some I saw the other day were looking very vigorous and promising. The weather has been just right for planting.

The nursery agents have been making big deliveries this spring, but are pretty nearly through now. Thousands of Ampelopsis Veitchii and Clematis paniculata have been planted. These two have become staple articles now, there being a constant demand for them.

Many additions to plants appear to be contemplated this year, some being already well under way. J. H. Dunlop and H. Dale are both making quite extensive additions.

The annual Horse Show and Military Tournament, held in the armories last week, brought many people to town. It is one of the most fashionable events of the season and makes quite a little stir in business circles. E.

FLORISTS' SUPPLIES,

88 Wabash Avenue, - CHICAGO, ILL.

You want this for Decoration Day!

VASE FOR THE CEMETERY.

THE

Clara Cemetery Vase

Patent Applied for by Mrs. C. W. Pike.

A RECEPTACLE FOR FLOWERS, LONG NEEDED FOR THE CEMETERY.

THE CLARA VASE for use at the Cemetery is a handsome as well as one of the most useful articles ever placed on the market. It is absolutely a new thing and takes the place of all the old tin cans, bottles and various old truck that are usually found in the cemetery for holding flowers, and prove such a disgrace where everything else is beautiful and ornamental. It is composed of solid glass and stands about twelve inches high. The lower end is sharp-pointed so it can be embedded about six inches in the ground and stand firm. It will hold sufficient water to keep the flowers fresh and sweet, and will accommodate flowers with long as well as short stems. The VASE is bell shaped and the top has a diameter of about five inches.

The VASE is sold at a very low price and is within the reach of all classes. It is very strong and well made and can not be broken by rough handling.

Prices, delivered to railroad or express companies in Chicago:

One Dozen, - - -	$3.50
Three Dozen, at - -	3.25
Five Dozen, at - -	3.00

Samples sent on receipt of fifty cents (50c.) each.

These VASES will retail in the market for from 50c. to 75c. each, thereby giving the dealer a profit of over a hundred per cent. on his investment.

THE FLORISTS' MUTUAL'S FIRST FIRE.

On April 13th, The Florists' Mutual Fire Insurance Association sustained its first loss, on the greenhouses of The Clinton Floral Company, of Wilmington, O. The policy was mailed from this office on the 9th of April. Under the by-laws the policy was in force from the time it was deposited in the mails here. The policy was not received by the Clinton Floral Company until April 14th. On the night of the 13th it sustained a loss by fire aggregating on the furniture, plants, buildings, etc., about $1,200.00. The insurance policy covered only the buildings, including the heating apparatus. Notice of the amount of the loss was received by the secretary on the 18th of April. I immediately went to the scene of the loss and adjusted the same on the 20th satisfactorily to the insured for $465.00. The proofs of the loss were forwarded to the president of the association. On the 28th I received word of his approval of the adjustment, and I wired the Clinton Floral Company that their draft for the amount of the loss would be honored by the association's treasurer, which was promptly done. I believe all losses can be adjusted as promptly as this one was and with equal satisfaction to the association and the insured. All we need is the full co-operation of all the florists of America.

I will gladly give full details to anybody who will write in relation to the same. W. J. VESEY, Sec'y.

Ft. Wayne, Ind.

PHILADELPHIA.

W. Atlee Burpee & Co., the well known seedsmen, will build a seven-story warehouse on North Fifth street. Plans have already been drawn. The building will be of brick, with Indiana limestone trimmings, and will be furnished with all modern appliances. Messrs. Burpee & Co. well deserve the success they are meeting with, for their name is synonymous with fair and honest dealing.

CLEVELAND.

Cut Flower Situation.

The cut flower situation during last week presented some anomalous features, more especially toward the end of the week. The weather throughout the time had been cold, generally cloudy and unfavorable for the development of cut flowers of any sort, although there were apparently enough to go around and some over, if one may judge by the prices for which some stock was sold at retail at times. Yet in spite of apparent surplus and bad weather business seemed to be generally considered as fair, though not heavy.

On Saturday roses by local growers were selling at from three to four cents wholesale, while several stores displayed staring signs announcing rose sales at from twenty-five to fifty cents per dozen. And the fifty-cent stock was not bad at all.

On the markets various retailers were scrambling for carnations, in some cases paying retail prices—twenty-five cents a dozen—with nothing at all good for less than a cent and a half, while in the stores pretty good stock was selling at no very great advance upon the higher price above mentioned. And nearly every grower was short of stock. All of which makes the situation seem decidedly odd.

Notes.

The suit of L. J. Leopold against the correspondent of the American Florist, which suit has been pending for some time, came to trial lately. After a trial lasting a day and a half, mostly consumed by legal arguments and the witnesses for the defense, the jury brought in a verdict for the defendant. This disposes of the matter finally, in all likelihood.

The bowling club at its last meeting had a very good attendance and some good scores were made. NEMO.

WANT ADVERTISEMENTS.

WANTED—No. 1 grower of cut flowers; would like an expert on fancy carnations; good steady place for the right man. Address H. H., care Florists' Review.

SITUATION WANTED—A young man, 20 years old, desires position in cut flower store or greenhouses; has six years experience; good maker-up; best of reference, also security. Address H. C. H., care of Florists' Review.

WANTED—A good rose grower. Also a good man for orchids, ferns and palms, for commercial place. Address Minnesota, care of Florists' Review.

SITUATION WANTED By a practical English florist and grower of No. 1 roses. Carnations, 'mums, violets a specialty. Now disengaged. Age 39. Commercial or private position. Address W., Florist, box 547, Alliance, Ohio.

FOR RENT—For greenhouse purposes, 32,700 feet on Michigan Avenue. Long lease and low rental. Room 922, 184 La Salle Street, Chicago.

SITUATION WANTED—As private gardener, by thoroughly competent man with the highest references from last employer and others. Removal of employer only reason for change. Address K. X., care Florists' Review.

GREEN-HOUSE CONSTRUCTION.

This has been a specialty with us for many years and to us is due the credit for many of the great improvements that have been made in the construction of wooden green-houses. To those that buy our

Clear Cypress Building Material

we furnish, free of cost, complete detail drawings from which any intelligent workman can put up the material correctly. We have plenty of time to write letters ABOUT OUR BUSINESS, and we will be glad to hear from those contemplating building.

Write for Circulars or Estimates.

LOCKLAND LUMBER CO.
LOCKLAND, OHIO.

WANTED—Young man to take care of several rose houses. Must be competent and well recommended. Address Emil Buettner, Park Ridge, Ill.

WANTED—An experienced propagator and plantsman. One accustomed to hard and soft wooded plants, where a great many are grown for a catalogue trade. Must be a hustler. No drinking man wanted. Steady place and good wages to right party. Apply with references to James Souden, foreman for L. L. May & Co., St. Paul, Minn.

FOR SALE—Six greenhouses, about 14,000 feet of glass; well stocked; wholesale and retail town of 4,000; no competition; less than 100 miles from Chicago; two railroads; good seed trade. For particulars address A, care Florists' Review.

WANTED—By the 15th of June, a first-class all 'round florist to take charge of plant of 8,000 feet of glass. None but steady reliable man need apply. References. Wages $50 per month. Address X, care Florists' Review.

FOR SALE

My seed store, established thirty years in the flourishing city of Terre Haute, requiring only moderate capital and capable of large extension. Ill health reason for selling; immediate possession given. Apply to

J. A. FOOTE,
313 Wabash Ave. Terre Haute, Ind.

PITTSBURG.

Business continues stationary. A surplus in roses being noticed. Carnations are now much more plentiful.

A window decoration of Messrs. Britenstein & Flemm attracted much attention last week. It was a ribbon decoration in patriotic colors, simple but very effective.

Britenbaugh & Bro., of Bennett, Pa., contemplate the erection of a large addition to their already extensive plant. The addition will be used as a carnation house.

Mr. Robert Faulk, a well known florist of this locality, who has been seriously ill, is reported to be improving.

The Pittsburg and Allegheny parks are aglow with tulips; the varieties and colors have been used to good advantage.

Prof. B. H. Patterson, of the Pittsburg Central High School, discussed "Plants of Historic Interest" before the Botanical Society of Western Pennsylvania last Thursday evening, May 5.

James C. Hamilton, son of Superintendent William Hamilton of the Allegheny parks, has enlisted in Roosevelt's regiments of cowboys.

Mr. W. H. Elverson, of the Pittsburg Clay Mfg. Co., of New Brighton, Pa., reports that a conflagration on the night of May 3 totally consumed plant No. 4, formerly owned by the Schoenfield Pottery Co. The loss will be about $30,000, partially insured. Mr. Elverson says that the fire will not prevent them from filling their orders promptly.

Fred Burki is sending some very fine out-door valley to market.

While the meetings of our Florist Club have been of an interesting character, and while the club is of no little use to its members, there seems to be room for improvement in the matter of attendance. The last few meetings were poorly attended. In view of the fact that arrangements for a fall flower show and banquet are under way, the officers of the club hope for a better attendance. T. P. L.

HUNT'S REVIEW OF THE CHICAGO MARKET.

The past week has been a repetition of the three preceding with slight exceptions. Trade continues very slow indeed, and the immense quantities of flowers sent in only aggravate the trouble.

Summer prices still prevail on all stock. Beauties especially suffer. Carnations, while selling fairly well, are not cleaned up as we would like to see them, reds in particular going very slow. The few days of cold, cloudy weather choked off the supply toward the end of the week and in consequence a better condition prevailed for a day or two.

Smilax is more freely offered. Out-door Lily of the Valley of fair quality is appearing. Narcissus plentiful. Lilac as yet irregular both in quantity and quality.

VAUGHAN, McKELLAR & WINTERSON, 45, 47 and 49 WABASH AVENUE, **CHICAGO.**

SARATOGA, N. Y.

What a delight it is to the senses when one can enjoy to the full such Beauties as T. J. Totten grows. Can the whole credit be given him, or must it be assumed that the beneficent mineral waters which abound here conduce in some measure toward producing such fine stock? Anyhow, some six houses are utilized for this rose alone, and New York with its crack growers must yield a point in favor here in excellence of bloom, foliage and yield; an excellent young stock is prepared for succession.

Carnations are a little off crop just now, the reason being that no fire is on, which permits the plants to harden up in order to bloom well along into the summer, when the demand cannot be supplied at this popular watering place. Speaking of chrysanthemums, Mr. Totten remarked upon the vagaries of Pink Ivory, which he planted in three houses and obtained as many distinct shades, each of which was pleasing. He attributes this chiefly to variation of light and shade.

Recently the original block of houses was torn down and removed to the new section, which is now a block comprising 50,000 square feet, with office attached, situated in the best part of town. In addition is a down-town store on Broadway (not Broadway, New York, although it is a worthy counterfeit), where every convenience associated with an up-to-date place is found. W. M.

SPRINGFIELD, MASS.

It is with regret that I report the decease of John Aitken, senior member of the firm of Aitken & Son. Mr. Aitken, who left us on April 30, was a long sufferer from a complication of diseases of the stomach. The worthy gentleman was born in Glasgow in 1835, was a good gardener of a most liberal temperament, combined with grit. The flourishing business built up by him will be continued by Mark Aitken, upon whose shoulders has descended the mantle of his sire.

W. M.

IF YOU HAVE anything to sell to the trade, offer it in an adv. in The Review.

LOCKLAND LUMBER CO.,

Lockland, Ohio.

GRAND RAPIDS, MICH.

Trade Quiet.

Trade is quiet for the first time this winter; even shipping orders are falling off. There is an abundance of all kinds of flowers, with fluctuating prices.

It is ideal, cool, lowering weather for carnation planting, and most of the firms are hard at it, trying to get planted before the cool spell is over.

News Items.

There is a prospect of the town becoming very metropolitan in the fact that we are to enjoy a street corner fakir from Chicago. He has been interviewing the different florists as regards to a possible supply of 5,000 flowers per day! But with what results is not yet known.

Mr. Boddington, of Clucus & Boddington, was in town trying to gather in bulb orders, and found the ground so thoroughly gone over that it took a fine-toothed comb to detect the location of an unplaced order. He vows he'll come earlier next time.

Obituary.

Bert Rodgers, 25 years old, a former Grand Rapids boy, died at Lansing of Bright's disease. He was an enthusiast in his chosen profession and had attained to a high degree of proficiency at the time of his death. He worked for Henry Smith under Wm. Cunningham for three years, going from there to the State Agricultural College, serving under Prof. Taft, on whose recommendation he was promoted to the charge of the conservatories and grounds of the Industrial School at Lansing. The interment took place here April 19th at Greenwood cemetery. The following florists acted as pallbearers: Henry Smith, Wm. Cunningham, Henry Van Velde, Wencil Cukerski, Jean Goebel, Freyling and Mendals. His parents have the sincere sympathy of the fraternity.

GEO. F. CRABB.

THE NEWPORT PHOTOGRAPH.

Members of the Society of American Florists and others desiring copies of the group photograph taken at Newport last August are informed that the undersigned has obtained possession of the original negative, and copies of same can now be supplied at one dollar each.

PIPING.

"It is not so much the system of piping followed as the accuracy with which the work is done," said Mr. Chas. Kroeschell, president of the Kroeschell Bros. Co., Chicago, in a recent interview. "The greatest care should be used to avoid all kinks, bends and sags, for each detracts seriously from the efficiency of the system by impairing the free circulation of the water or steam, and every impairment of the circulation makes a waste of fuel. Therefore, careless work in piping is a continual expense in extra fuel. With many florists from 15 to 30 per cent. of their fuel is wasted because of piping that is not true. In piping a house, a perfectly level line should be established from which measurements to the piping may determine absolutely its trueness. The rise or fall should be about an inch in every ten feet. To establish a quick and rapid circulation of the water, the top of the boiler should be at least one foot below the heating coils in the greenhouses. It is in this respect that the Kroeschell Bros Co. Improved Greenhouse Boilers have a marked advantage, as they do not require a very deep pit in order to sink them below the coils. It is also very essential as a matter of economy to have boilers for hot water heating of sufficient capacity to easily heat the water in the pipes without forcing or crowding the boiler. In this respect the Kroeschell boiler has never been found wanting, as its capacity has always been fully up to the rating quoted in their catalogue."

A glance through the large establishment of Kroeschell Bros. Co. reveals the fact that the manufacture of greenhouse boilers is but a small department of their business, though they are at present at work on a greenhouse boiler of the largest size, which will have capacity to carry 12,000 feet of 4-inch pipe. They manufacture large boilers of every description, and do heavy sheet iron work of every variety. The working of the various huge tools is very interesting, a number of them weighing many tons. An overhead carrier is sufficiently powerful to transport a weight of twenty tons to any part of the building.

NOW in course of preparation, The Florists' Manual, by William Scott. It will cover the whole field of commercial floriculture, the articles arranged alphabetically, so that reference may be quick and easy. It will be a whole library in itself. Price only $5.00. Send in your order now to the Florists' Publishing Co., 530-535 Caxton building, Chicago.

....CO-OPERATION....

IF you are in the trade and are not yet a subscriber to the FLORISTS' REVIEW, send in your name and one dollar now and you will receive not only the FLORISTS' REVIEW for one year, but also a certificate entitling you to the earnings on one dollar's worth of stock in the Florists' Publishing Company.

Why do we make such an unparalleled offer? It is very simple.

You will have an interest in the success of the paper.

You will see that you can buy everything that you want to just as good advantage from advertisers in the FLORISTS' REVIEW as elsewhere and at the same time benefit yourself by increasing the earning power of your certificate.

This mutual arrangement cannot fail to bring to the paper a heavy advertising patronage, and as a result the stock represented by your certificate will earn good dividends. And the more you buy of advertisers in the FLORISTS' REVIEW (always mentioning the paper), the larger your dividends will be.

You get the best paper in the field and a share of its earnings.

Send in your subscription now.

The Model Extension Carnation Support

QUEENS, N. Y., Feb. 16, '97.
MR. THERON PARKER, Brooklyn, N.Y. Dear Sir:—I have tested your latest Model Carnation Support, and am free to say that I consider it the best wire carnation support that I have ever seen. It is quickly and easily applied, and I think will prove very durable, and you certainly deserve great credit for the invention.
Very truly yours,
C. W. WARD.

FLATBUSH, BROOKLYN, N. Y., Feb. 18, '97.
MR. THERON PARKER.
Dear Sir:—Your wire stake is certainly a gem. Without hesitating we endorse it as an up-to-date Carnation Support. Yours truly,
DAILLEDOUZE BROS.

W. HOBOKEN, N. J., Feb. 18, '97.
MR. THERON PARKER, Brooklyn, N. Y. Dear Sir:—It gives me much pleasure to congratulate you upon your success in getting up Carnation Supports. I think that those I have had from you are about as perfect as anybody will be able to make them. They certainly fill my bill for an ideal carnation support, a thing I have been looking for for a long time. Wishing you every success in the sale of them, I am,
Yours truly, E. ASMUS.

EVENDEN BROS., Williamsport, Pa.

ALBANY, N. Y.

Sam Goldring reports a blue Easter, or rather a violet one, when in three days they disposed of 22,500, and not salted at that, right over the counter. I took care to note down the exact figures. Verily, the prophet who predicted some year or two since that the real thing would be no more in demand was away off in his prophecy.

H. G. Eyres says it was a Beautyfull Easter with him. Lilies, of course, were in great demand. His store was so well stocked that the photographer was obliged to take four separate views to satisfy Harry, who, now that the rush is over, is squaring up his business to be in readiness to go to the front should duty call; and he means it; there's blood in his eye, and the vengeful manner in which he grasps his cane gives one a faint idea of the havoc he would create were it only a gun.

John Dingwall can give the boys some pointers on hghting, as he was engaged in the peaceful calling he is now following—tnat of raising bedding stock par excellence—in '62, and although he did not actually kill a man, it was because he was not given a chance to do so. He has long since laid aside his sword, and the only crime he commits is exterminating the varmints in the soil. His son is a fine specimen of the modern warrior, and will be duly heard from should occasion require. Let us hope that he, with other ambitious sons of Flora, will not be compelled to leave their peaceful occupation for terrible slaughter, but depend on it, they are ready and willing to respond to the call of duty.

L. Menand sold all his flowering stock at Easter, and has the benches filled with stock for cemetery use, and for which he has a large demand.

W. M.

PLATTSBURC, N. Y.

It was with a sad smile Wm. Cook bade adieu to the gallant troops quartered here, now en route to the seat of war, as by their absence he temporarily loses many of his best patrons. It is to be hoped the parting will not be for long, that they will return covered with laurels, and that Mr. Cook will be surfeited with orders for bouquets from the dear girls left behind and who are now inconsolable. Apart from this the season has been a good one, and the well grown stock found ready buyers.

W. M.

IF YOU want to buy you will find it to your advantage to buy of the advertisers in The Review. If you want to sell, you will find it to your advantage to advertise in The Review.

Extra select stock at Kennicott Bros. Co., Chicago. All flowers in season at lowest market rates.

Last Call For Field-Grown Roses!

ORDER BEFORE IT IS TOO LATE.

We still have to offer an exceptionally fine lot of

HYBRID PERPETUAL ROSES,

extra strong field-grown plants of the very finest sorts, such as **Mrs. John Laing, Ulrich Brunner, Mme. Gabrielle Luizet, Paul Neyron, Magna Charta, Gloire de Paris, Baroness de Rothschild, Gen. Jacqueminot, etc.** This is fine stock for potting for late spring sales or for out-door planting—fine strong blooming stock. We offer it as long as unsold at **$12.00 per 100.**

We have to offer also, a magnificent lot of

YELLOW RAMBLER ROSES,

strong dormant plants, 3½-inch pots, **$10. per 100;** 5-inch pots or strong field-grown plants, **$20.00 per 100.**

We offer also fine strong field-grown plants of

CRIMSON, WHITE AND PINK RAMBLERS,

at same price as Yellow Rambler.

We have a large stock of extra strong field-grown plants of

CLEMATIS—finest sorts—**Mme. Ed. Andre, Jackmanii, Henryii,** and **Hybrida Sieboldii. Price, $30.00 per 100.**

CLEMATIS PANICULATA—extra strong field-grown plants, **$15.00 per 100.**

HYDRANGEA PANICULATA GRANDIFLORA—strong field-grown plants, 3 ft. high, **$12.00 per 100.**

AZALEA MOLLIS—extra fine, well budded plants, very bushy, **$35.00 per 100.**

We have also a few thousand **SPIRAEAS** left, which will make nice stock for potting for Decoration Day. Can offer strong clumps as follows: **Spirea Astilboides Floribunda,** $5.00 per 100; case 250 clumps, $10.00. **Spirea Compacta Multiflora,** $6.00 per 100; case 250 clumps, $12.50.

See our special offer of **HYDRANGEA OTAKSA** in last week's Review. This offer will hold good for this week. We sold a lot of this stock last week, and will hold the same offer open for another week. If you want any Hydrangea Otaksa, now is the time to buy it. Full particulars in last week's ad.

THE FLORISTS' REVIEW.

Always mention the **Florists' Review** when writing advertisers.

ST. PAUL.

Trade Conditions.

Trade was good immediately after Easter, but has fallen off somewhat the past few weeks. We are too remote from the seat of war to feel its blasting effects as depicted by our New York correspondent. The departure of the Third regiment from Fort Snelling, however, will have some effect on the florist trade here. The officers spent money freely and during the social season there was one continuous round of gaiety at the Fort. As the troops passed through the city one local firm, L. L. May & Co., distributed roses to them in the cars.

We have had all kinds of weather since Easter, and our spring, which seemed so far advanced at that time, is behind the average.

Stock is plentiful and of good quality. Carnations still continue in good demand, and the cut is still behind, several shipments from Milwaukee being noted each week. Violets are still in evidence, though fast deteriorating in quality.

The trade in the plant line has hardly commenced as yet. At the city market some good stock is seen, but sales are slow. Planting out will be delayed for ten days at the least. Decoration Day trade will undoubtedly be good, owing to the newly awakened patriotism.

Notes.

Retail prices for first class stock are well maintained, though "roses at 50 cents per dozen" is a frequent sign of late. One grocery store advertised "Roses, 29 cents per dozen. Fresh cut." Whether these were a home grown article, or were furnished by outside parties, we did not learn.

Christ Hansen has discontinued his city store and will hereafter devote himself to growing cut flowers for the trade.

J. Austin Shaw, the Brooklyn bard, was a recent caller. He has an innovation in the way of a small hand grip full of live plants as samples.

H. J. Goemans, representing K. J. Kuyk, of Ghent, Belgium, was also a recent caller. X. Y. Z.

Seasonable Plants

30,000 Ampelopsis Veitchii We offer a fine lot of strong 3-in. pot, one-year-old pot grown plants, 18 to 24 inches high, $6.00 per 100; $50.00 per 1000.

Rudbeckia Golden Glow One of the best hardy perennials. Excellent as a show plant for the border, and invaluable for cutting through the summer and fall. Strong, 2¼-in. pots, 50c per doz.; $4.00 per 100.

Double Petunias Our unrivaled strain. A fine lot in 3-in. pots, mixed unnamed varieties, $5.00 per 100.

Dracaena Indivisa A fine lot of 5-in. pots. A good size for medium sized vases, baskets, etc., $3.00 per doz.; $25.00 per 100.

Dracaena Bruanti Another useful variety for vases, baskets, window boxes, etc., 4-in. pots, 12 inches high, $3.50 per doz.; $25.00 per 100. 5-in. pots, 15 inches high, $4.50 per doz.; $35.00 per 100.

Dracaena Godseffiana The most striking foliage plant introduced in many years. It rivals the Aspidistra and Rubber as a house plant. Strong plants from 4½-in. pots, $3.00 each; $30.00 per doz.

Deutzia Lemoinei The best hardy plant offered this season. A great improvement on D. Gracilis, which it will soon supercede, both as a plant for the garden and for forcing. 3-in. pots, $2.00 per doz.; $15.00 per 100.

New Dwarf Bedding Geranium "Mars" A distinct and useful pot or bedding variety. 2¼-in. pots, $1.00 per doz.; $8.00 per 100.

Microlepia Hirta Cristata It is seldom that we are in a position to offer this valuable fern in quantity at low prices. We consider this as useful as the Nephrolepis for growing into specimens. It is of rapid growth and a good hardy house plant. $1.00 per doz.; $8.00 per 100; $70.00 per 1000 for good 2¼-in. pot plants.

Cycas Revoluta Dormant stems. A fine lot weighing from 4 to 50 lbs. each. 10c per lb. in lots of 250 lbs. or less. Special prices on larger quantities.

HENRY A. DREER, 714 Chestnut St., PHILADELPHIA, PA.

MacMICHAEL'S Sulphur Blower.

Far better, quicker and more effective than the bellows.

Warmly commended by all who have tried it.

Patent Applied for.

Price $5.00, packed and delivered to Express Co. Satisfaction guaranteed.

Chicago, April 22, 1898.

Mr. H. MacMichael, City.—Dear Sir:—The sulphur machine is a decided improvement over the bellows for putting on sulphur, and I take great pleasure in recommending it to the trade. As a labor saving device it does the work quickly and very satisfactorily.

Yours truly, GEO. COLLINS,
Foreman for Peter Reinberg.

SECTIONAL VIEW.

1859. "THE WEATHERED" 1898.

IMPROVED SECTIONAL BOILER,

1898 MODEL

For Water or Steam Heating.

A FEW POINTS CLAIMED FOR THIS BOILER

Simplicity of construction.
Sectional Headers.
Sectional ash-pit.
Maximum vertical circulation.
Minimum friction.
Direct or indirect draft.
Smoke-box on front or back.
Rapidity of water circulation.
Easily cleaned in every part.

Grates on level with fire-door opening.
Greatest amount of boiler surface exposed to radient heat.
Heating surfaces so arranged in fire-box that the hot gases must strike every part before entering combustion chamber.
The latest and most up-to-date hot-water or steam-heating boiler in the market.

MANUFACTURED BY

Thos. W. Weathered's Son,

Factory, 196 to 240 Orient Ave., Jersey City, N. J.

Office, 141 Centre St., New York City.

NO DUTY ON WHEAT FOR SHEAVES.

By a decision of the U. S. general appraisers at New York, April 19, 1898, imports of "Stems of wheat, unbleached, for funeral decorations," are free of duty, "under paragraph 566, act of 1897, as grasses or fibrous vegetable substances not dressed or manufactured." The decision was rendered on the protest of an importer against the decision of the appraiser, who had returned the wheat as "ornamental grains," upon which there is a duty of 50 per cent.

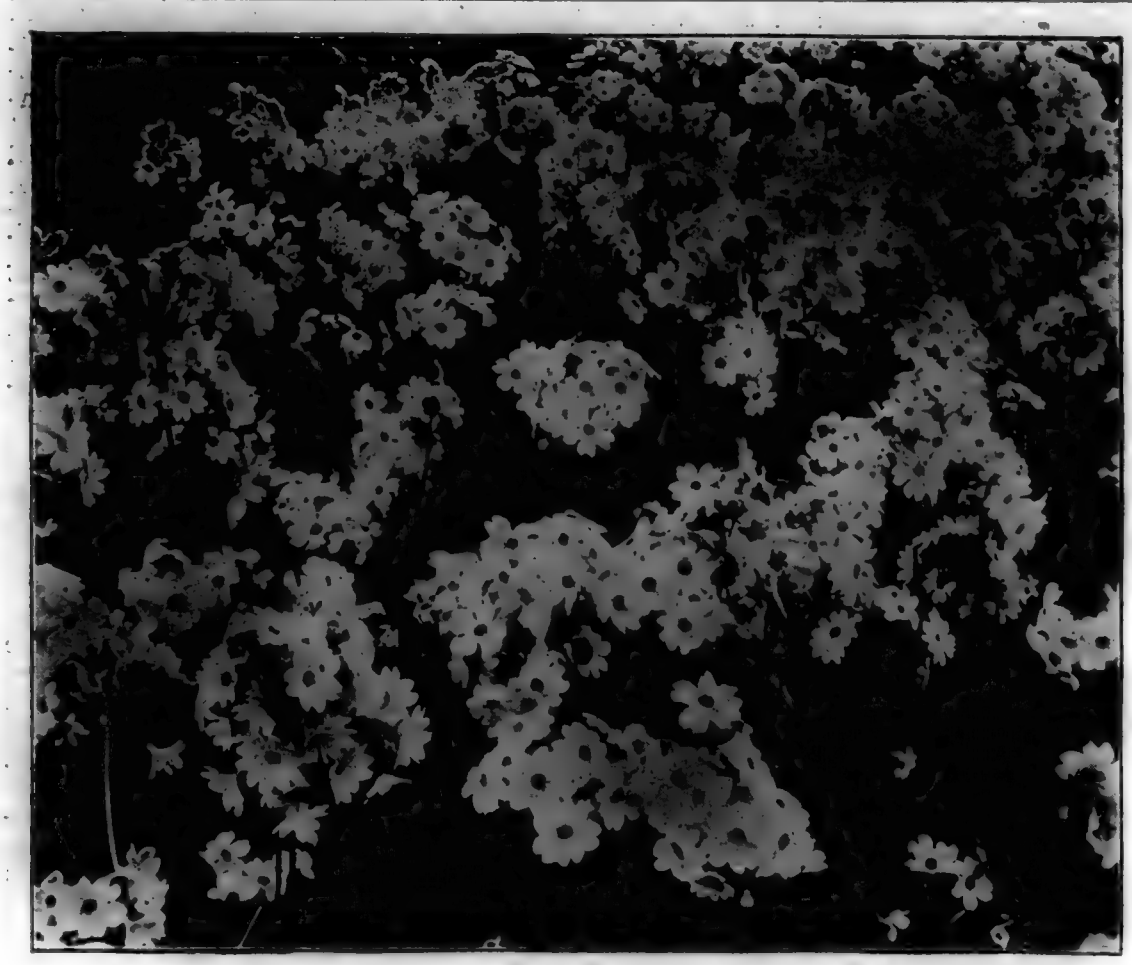
FLORISTS' REVIEW



COPYRIGHT, 1898, BY
FLORISTS' PUBLISHING CO., 520-535 Caxton Building, CHICAGO.

Vol. 1. CHICAGO AND NEW YORK, MAY 19, 1898. No. 25.

PRIMULA OBCONICA.

[From advance sheets of the Florists' Manual, by William Scott.]

This is a true species of this very large genus and less than twenty years introduced to cultivation. The same

Primula Obconica.

general remarks will apply to P. obconica as to the widely grown P. sinensis. They like to be cool, airy and there must be an entire absence of dampness. Many profess to being poisoned by handling this pretty plant, but all people are certainly not so affected and you now hear much less of this annoying characteristic than you did a few years ago. Of all other primulas adapted to pot culture this has the longest season of flowering. One author says: "It flowers more or less in a cool greenhouse or conservatory nearly all the year." We can certainly have it in flower from November till well along in summer.

Old plants can be divided in June and kept close and shaded in a frame till they are rooted in their new pots, but raising them from seed is more expeditious and entirely satisfactory. Sow in April or May, or as soon in the spring as you can get fresh seed. Their season of flowering is not only of long duration but they are most prolific, hundreds of their pale lilac umbellate flowers being produced from one plant in a 5 or 6-inch pot. When large enough to handle pot the young plants into 2-inch pots and when well rooted in those shift into a 3-inch. From this time till the approach of hard weather a cold-frame will suit them much better than a greenhouse. See that the surface of the frame is dry, and raise the sashes back and front, shading in the hottest weather. In October shift into their flowering pots; a 5-inch ought to do.

A good loam with a fifth of well rotted leaf mould, or as a substitute for the latter, well decomposed spent hops, will grow them finely. They make lots of root, so will take a liberal allowance of water, particularly when flowering profusely. A night temperature of 45 to 50 degrees will do nicely for the winter months. Like most all of the primulas they are exempt from the attacks of any of our insect pests, but I never noticed that they suffered in the least from fumigating while being in the same house that it was necessary to smoke for the benefit of other plants.

ROSE MARIE FAVIE.

The introduction of polyantha roses has given valuable material for massing and the illustration in May 5th issue shows the wonderful blooming qualities of this variety. The flowers are among the first to appear in spring, and with only a few days' intermission continue to give a profuse harvest until December.

The plant is perfectly hardy in the eastern states, and this adds to its value for open ground culture. The flowers are one and one-half inches in diameter, pale rose at opening, but

changing to pure white. It is unsurpassed for a low hedge and nothing could be more desirable for that purpose, especially for cemeteries where lots are still enclosed. As a forcing rose where small flowers are not objectionable, it is worthy of a trial. Plants grown in pots under glass are excellent for winter blooming.

P. J. B.

A ROSE PEST.

Growers in various sections of the country have of recent years suffered considerable damage from a little white worm that attacks the flower buds of the rose when they are quite small, and puncturing the stem just at the base of the bulb causes the bud to turn black and drop off. With one large grower the pest has been especially destructive on his Meteors.

The government entomologist, at Washington, tells us that the worm is the larva of a new species of the genus Cecidomyia, which has not yet received a specific name. It is the habit of these little larvae or maggots to leave the buds, flowers and stems when they are full grown and to drop to the ground, which they enter, and there undergo their transformations, issuing eventually as delicate little two-winged flies.

Kerosene emulsion is recommended to be sprayed on the plants as a remedy, one part of kerosene to twenty parts of water. As some of the larvae may drop on to the paths and make their way to the ground under the benches it would probably be wise to spray there also. Possibly persistent fumigation during the time the little flies are emerging from the soil would be effective. As the pest can so completely destroy a crop of roses it is one that should be most vigorously combatted, and no effort spared to eradicate it. If the flies are killed before their eggs are laid of course there will be no larvae and it is the larvae that do the damage.

SOME ROSE QUESTIONS.

I have one house, 20x120, shed roof, facing the south. There are two overhead 2-inch steam pipes running along the two purlins and four 1½-inch return steam pipes hung on the sides and ends. I have never yet been able to grow Meteors satisfactorily. The house has a glass partition across the middle. Will you please locate where I should place 100 Meteors. For the first 60 feet at the end near the boiler are two solid beds. In the east 60 feet, or the end farthest from the boiler are three raised benches and four paths. I want to grow roses and carnations in this house—about 500 carnations, the remainder of the space to roses. I grow La France, Wootton, Bride, Bridesmaid, Gontier, Perle, Beauty and Kaiserin. We have a bench 6x50 in a house running north and south that we use for roses.

If you will instruct me where to place the various varieties where they will give the best returns, and where I can grow good Meteors, I will consider it a special favor. E. C. N.

South Dakota.

It is not quite plain to me whether this house runs north and south or east and west. The latter for growing roses and carnations is much preferred, but if built the other way and the glass is of a good size and there are no deep rafters, you can get along all right and grow roses. I say the above with confidence as good roses have been well and profitably grown in a house with the ridge north and south and the glass only 8x10 inches, but no one would think of building such a house nowadays for either roses or carnations.

The number and size of pipe is sufficient to keep up the desired temperature, only I do not approve of the overhead pipes. It is a waste of heat. Hung on the side walls is the place for them, the top pipe as near the glass as possible. Always spread the pipes as much as possible. The farther the pipes are from one another the more heat you will get from them. If not too much of a job put all your steam pipes on the side walls. Plant the Meteors in the partition nearest the boiler, as in that case there will be no gable end to be cooled off by cold winds.

Roses are grown to such perfection on raised benches in four inches of soil that it is useless to discuss solid beds. American Beauties are grown in solid benches very largely now by some Eastern growers. I could not see that they were more healthy or bore more or better flowers than those on raised benches, but they were just as good and there is one big item saved—the continual building and repairing of benches. These so-called solid benches are not two or three feet of soil; they are simply six inches of soil on top of coal ashes or some other material that gives perfect drainage. You had better stick to the benches with four inches of soil and see that the planks of the beds are not over six inches wide and a space of three-quarters of an inch between them. It is understood by all rose growers that Meteor requires 10 degrees higher temperature by night and day than our other roses, or you will get less buds and they will be useless. Sixty-eight degrees at night is the correct thing for Meteor; an occasional drop to 65 degrees won't hurt. Fifty-five to 58 degrees is considered by all good growers as the proper temperature for nearly all the other varieties. For the two most valuable roses, Bride and Bridesmaid, it is high enough. You will get more buds if the temperature is kept steadily at 58 to 60 degrees, but at 54 or 55 degrees you will get the finest flowers.

I have read somewhere about carnations being grown in a night temperature of 60 degrees, which is absurd. You might force out a lot of flowers in that heat and spoil your plants, but that is not growing carnations; 50 degrees at night will grow any carnation from October to June, and that still most valuable kind, Daybreak, will be far better in a night temperature of 45 degrees; in fact, that is abundantly high. Many make the mistake of firing hard at night and then let up during the dark winter days. If your carnations have been at 50 degrees at night they should at least be 65 degrees in the day time, with ventilation, if possible, every day. Maintain the temperatures I have given above and mix a liberal amount of brains with your watering and you will get flowers.

WM. SCOTT.

FERNS FOR DISHES.

Mr. A. McAdams, Chicago, has quite a large trade in fern dishes and grows himself the larger portion of the ferns he uses. For lasting qualities he places Cyrtomium falcatum at the head and another point in its favor is that it is very easily propagated. From a couple of stock plants he can get all the spores he needs. These are sown in May and June, which brings the young plants to a useful size for the holidays and later. It is some trouble to carry the plants through the hot summer, but it is well worth the trouble. They can be carried through the summer in a shaded house in which a damp atmosphere is maintained. If propagated in the fall they are slower to come to a useful size and are apt to attain that size at a time when there is a surplus of ferns. From the seed pans he pricks out little clumps into flats on

the surface of which is a layer of very fine gravel and coarse sand to prevent the appearance of fungus. When of sufficient size these clumps are again divided and the individual plants placed in 2½-inch pots. They are kept in these pots till used. If a few become over-sized they are potted up and worked off as pot plants, but this is to be avoided if possible. A good way is to sow some every month in order to keep up a succession. The above applies to practically all the ferns he grows.

Next to the above he places Pteris serrulata and Pteris serrulata cristata, both of which are used in quantity.

Pteris magnifica is found very useful, but it is a very rapid grower and is apt to soon get beyond the desired size, it being a tall grower also, which makes it unavailable for dishes when large.

Pteris cristata variegata is considered a gem, but the stock seems to be still scarce. It is splendid for a light colored variety. It produces spores very sparingly and may never be plenty.

Pteris adiantioides and Pteris palmata are both useful ferns. The former is the best in some respects, but both are good keepers.

Lastrea opaca is used when in a young state, and is useful to give a feathery effect. Onychium japonicum will give the same effect, but is not lasting enough, and if used in a dish is one of the first to give out. None of the adiantums can be used for the same reason.

Cocos Weddeliana, though not a fern, is much used in the center of fern dishes and always gives satisfaction.

He has of late been using small plants of Asparagus tenuissimus in fern dishes and the results were so satisfactory that he is growing a batch of plants for the purpose. It adds a grace to the arrangement and is more lasting than the ferns. Customers seem to like it.

Pteris Mayii is a pretty and useful fern for dishes, but plants are very slowly produced.

Pteris cretica albo-lineata has been practically discarded. It is easily increased, but the habit is too straggling. The mature leaves hug the surface of the soil and the slender young fronds thrown up from the center are not very decorative.

Pteris Victoriae is pretty, but color not sufficiently distinct under ordinary cultural conditions to meet requirements. P. Argyreia has good color, but the plants won't stand the wear and tear and the habit is too bold.

In ferns for pot specimens he places Nephrolepis exaltata Bostoniensis at the head, though he also uses N. exaltata freely. N. cordata compacta he finds too stiff in habit, and it soon grows so dense that it is apt to decay in the center. N. davalloides furcans is a very useful variety as a pot specimen.

When of large size Cyrtomium falcatum is also useful as a decorative pot plant, but there is sometimes an open center that detracts from its value in this connection.

In spite of the fact that Mr. McAdams grows so many ferns himself, he still finds it necessary to buy a few thousand occasionally of varieties of which he has run short.

Interior.

Exterior.

THE NORTH CLARK ST. STORE OF MR. GEO. WITTBOLD, CHICAGO.

And the more you buy of advertisers in the Florists' Review (always mentioning the paper) the larger your dividends will be.

You get the best paper in the field and a share of its earnings.

Send in your subscription now. Address the Florists' Publishing Co., 520-535 Caxton building, Chicago, Ill.

If you don't get your own stock planted out before the 5th of May you are not likely to get it done before the 15th of June. I speak from experience, for those twenty days are so taken up with filling orders that you have no time to think of anything else. You may make up your mind that you will have one man "attend to such things," and leave him alone and it will only be in your mind, for when you are in the real rush you will call him to help out and half a dozen others if you had them. So get out all you can a few days before you begin planting for your customers.

What to Plant Out.

You should have a good number of Stevia serratifolia (sweet stevia). Give them two feet each way. They want no attention after the first watering except hoeing. If you still grow bouvardias plant them out a foot apart in a rich, light soil. A few Linum trigynum are desirable; give them at least one foot each way.

Hydrangeas that are not wanted for Easter forcing should go out at once. If you don't have a deep, rich soil for the hydrangeas within reach of the hose you can plant them later on the bench in five or six inches of soil, where they will be sure to get attention, but if you have the right place outside there they make the largest plants.

A lot of English ivy that was propagated this spring should go out. They make the best of droopers for vases and boxes. They make fine plants by the fall, lift so easily and occupy the poorest place you have; even under the benches they will thrive. You will want a good many vincas. Get them into the ground at once. They make fine plants for division during the next winter.

Plant out a few of everything you need for stock. A few plants of each are enough of many plants, but of others more, and above all get out your stock of geraniums. The Zonale, variegated, bronze and the semi-double are much the most important of all and you cannot get thousands of good, healthy cuttings next September unless you plant out now a fine lot of healthy plants, and now is a good time to buy any new varieties that you wish to add to your stock. Alphonse Riccard is turning out a most beautiful large flower of rich, rosy scarlet; just what we want for a bedder. I don't keep account of the varieties now as I did when we could tell forty of them by their leaves without the flower; less varieties will do. Some of the most beautiful flowers make poor growth outside. S. A. Nutt, by no means new, is a grand variety to grow and flower, but a little dark. The variety mentioned above is likely to become very popular.

Ten or twelve inches apart is all right to plant geraniums for a flower bed, for a dense mass of flowers is all that is wanted; but for cuttings they should not be so close. Keep the rows eighteen inches apart and the plants fifteen inches in the row. You want air and daylight to permeate through them and the cuttings to grow close jointed and firm.

You will most likely have added several new varieties of cannas to your stock; quite right if you did, for there are several fine ones. Get them out of the house and plainly labeled before they are sold by mistake for perhaps less than they cost. Never put out new geraniums and other plants, particularly cannas, which you don't know in variety familiarly by sight without distinctly and plainly labeling. You think you will remember them, but you won't, and if you did it would be a foolish tax on a brain that should be better employed. A plainly written label saves all trouble. There is not only a great advantage to the plants in getting them out in good time, you will have less to care for inside.

Dahlias.

There is likely to be a good demand for these this spring. When their requirements are well understood they can be grown here to perfection, but not with the same care as you bestow on a canna or salvia. Dormant roots could have been put out a week ago, but the started plants and those propagated this spring should not go out till the first of June. Dig a hole eighteen inches across and one foot deep, put three inches of manure in the bottom, and when filling in the soil again mix at least a third of manure with the soil. Leave the surface cup shaped so that you can water readily and to good effect. Drive a good stout stake into the center of the hole four or five feet out of the ground and then plant the dahlias.

If you do this labor for your customers they must pay for it. It is no use trying to grow dahlias unless you go to this trouble, and although I am entirely opposed to watering our summer flowers out of doors the dahlia is an exception. A good soaking twice a week is what it wants. After the plant has started to grow hoe the surface and then put on a heavy mulch; watering will then be of the greatest benefit.

Planting Flower Gardens.

Year by year we are expected to do more labor for our patrons without extra compensation, but we must draw the line somewhere, and the plan we adopted last year worked all right. If there is a bed or beds, the order for which amounts to $10 and upward, the customers will invariably ask you if you won't let your man plant them, "the beds are all ready." Sometimes this is true, and many times they are only ready for the pickaxe and spade, being as hard as seven months of winter can make them. Let it be clearly understood that if the beds or borders are really ready your man will plant them, but if they are to be dug and raked, the men's time will be charged for, and charge 40 or 50 cents an hour for their labor; in your busy time it is worth it. An expert will plant a great many plants in an hour. They will be properly done and redound to your credit, whereas if their hired man planted them it would be a botch and you would often be blamed.

Speaking of proper planting, say for geraniums, coleus, heliotrope, etc., there is only one proper way. I can hear some young men say fiddlesticks and see older men turn up the point of their proboscis; it does not matter, it is the way. Make a hole with the trowel a little larger and deeper than the ball of the plant. Place the plant in and enough earth to hold the plant in place, or say half fill the excavation. When all the plants are in their places water, not as a shower, but to each individual plant. In a few minutes fill in the surface with the dry earth. That watering will last longer and be of more service to the plants than all the future surface watering you can give. How long would you have to stand with a hose to wet the ground say six inches deep? Think of it; if there was the slightest rounding to the bed you would have the surface soil all washed off before the roots were

reached. This is the way to plant, whether it be a geranium, carnation, a Norway spruce or an elm tree.

Sow your first sowing of primula end of this month; also Primula obconica, they sold pretty well last winter.

In conclusion, although carnation houses have done finely without any fire heat for more than a month it is the poorest economy to let your fires out in the plant houses. A little fire heat and plenty of ventilation should be the order of things till June 1.

WM. SCOTT.

CHRYSANTHEMUM NOTES.

Propagating.

The great bulk of cuttings if not already in the sand, should be put in as soon as possible. For late work, of course, June is early enough, but plants for the main crop cannot be prepared any too soon. Cuttings will root out in cold frames all right now if the glass be shaded and they are frequently syringed, and will be better outside. In fact unless one has a good, cool propagating house, well shaded, young plants, too, if put out in the frame for a week or two, harden up wonderfully and are in a good deal better condition for planting than they would be if kept inside, where they are too often stood close together and get drawn up.

Planting

should be begun as soon as the early varieties are ready. Use a good fibrous loam to fill the benches and if you must use manure, let it be well rotted. We don't believe in using any. It is not necessary and in fact is often a cause of trouble if care is not used in watering. If you are growing many mums the early varieties are better if they have a house to themselves, then in the fall when the application of a little heat means a big difference in the profits by getting the flowers earlier, it can be done without any detriment to the main crop.

When all are planted in the same house all necessarily receive the same treatment. If only one house is used we would suggest planting the early kinds at the warm end. The indiscriminate rooting and planting out of varities all mixed up cannot be too much condemned. To get good results attention must be paid to season of flowering, relative heights, colors, etc. In addition to the early kinds the dwarfer, more delicate of the midseason varities should be planted this month. Our Bonnaffon are planted, and others we would recommend to be benched as soon as possible are Mrs. Jerome Jones, Mrs. Robinson, Golden Wedding, Pennsylvania, and Ivory; in fact, to get the best possible results, May is a good month to bench most all kinds except the very strongest. Exhibition flowers cannot be expected when the plants have only four or five weeks in which to make their growth.

The distance apart to plant every man must settle for himself, taking for his guide the quality of flowers he wishes. For finest flowers 10 inches each way is not too much. Then the sun gets a chance to ripen up the wood of each plant in the middle and at the back of the bench equally with that of the plants in the front row and ends.

C. TOTTY.

THE PAEONIA.

[From advance sheets of the Florists' Manual, by Wm. Scott.]

We sometimes laugh at our old-fashioned friends for calling these handsome perennials "Pinies," but old-fashioned catalogues sometimes spell the name "Piony," and that comes pretty near it.

The cultivation of the herbaceous section is too well known to need any lengthy remarks. They should have a deep, rich soil; you cannot overdo it on either point. If planted for commercial use, four feet apart is as close as they should be placed. They will flourish for a number of years undisturbed, but every fall a good sprinkling of manure over the surface and forked or cultivated in the spring, will help them retain their vigor.

The flowers of the paeonia are in good demand every season and if you have plenty of room a few hundred plants will be quite profitable. The white and different shades of pink are the favorites. There are hundreds of varieties, and many beautiful ones that are called single, some being quite single and others having a small double center with an exterior row of large petals; these are very beautiful and can be called the anemone section.

The herbaceous paeonias are the hardiest of hardy plants. The best time to divide and transplant to increase the stock is in October and November, or very early in the spring, as soon as the frost is out of the ground. A small section of root with an eye or bud will in three years make a large clump. When planting small pieces in the fall be sure to get them well down in the soil; let the bud be an inch below the surface, for the frosts will be sure to raise them up.

Paeonias seed freely and if the seed is sown as soon as ripe and the little plants kept in a cold frame the following winter and planted out in the spring, they will flower the second year. For the commercial florist it is, however, must better to buy roots of both these and the tree section.

Tree Paeonia Queen Elizabeth.

The Tree Paeonia, as its name implies, more nearly resembles a shrub and the flowers surpass in beauty those of the herbaceous section, but are not so useful to the florist. They make beautiful specimens for the lawn, either singly or in groups. They are largely used to force for conservatory decoration, and are a valuable addition to our Easter plants, though they can be forced as early as January. For forcing, good plants should be selected in the early spring and potted into good sized pots or tubs and grown the following summer; then they will force with ease and satisfaction the coming winter.

You cannot divide the tree paeonia at the root as you can those of the herbaceous section, they being grafted, an operation you had better leave to the specialist.

PHILADELPHIA.

Supply—Prices.

Quaker week closes with a fine day and a record for clearness that was out of sight of either of its predecessors. The week pretty nearly broke the record in another way. The tradition has been handed down that on May 10th you can safely plant geraniums and other soft wooded plants out of doors. This tradition is almost universally respected here; on May 9th we get ready and on the 10th out they go. Well, this season we had a beautiful white frost on the 9th and early on the morning of the 10th the thermometer registered 38 degrees!

Business was fairly active in plants, but quiet in cut flowers; though the demand is satisfactory for the season. Roses are plentiful, the bright weather of the end of the week perceptibly increasing the supply. Carnations are not coming in freely; the price is $1 to $1.50, fancies $2 a hundred. Returning to roses. Good Beauties are $1.50 to $3; teas, $3 to $4; a very few worth $5 and $6. Sweet peas are 50 cents to $1. It now seems likely that even the earliest outdoor blooms of this popular flower will be too late for the first June weddings, which will give the indoor crop a little more chance. Valley is in moderate supply at $2 to $4. Asparagus plumosus and Sprengerii have sold well in sprays.

Germantown Hort. Society.

At the meeting of the Germantown Horticultural Society on Monday evening a very interesting talk on wild flowers was given by Secretary Redles, who also presented the society with a gavel made from the pecan tree lately cut down at the corner of High and Main streets. This tree is said to have grown from seed sown by Thomas Nuttall over one hundred years ago. Frank Smith, gardener to the Misses Nixon, showed an interesting collection of plants.

Benefit for Florists' Club.

Wednesday was benefit night for the Florists' Club at the "Telephone Girl." The members present discovered that Busy, Busy, Busy really referred to the fair operator and not to their desired connection, while the ladies were deeply interested in learning wherein lay the charm of this hitherto unseen business associate. Dumont & Co. were largely instrumental in getting up the bouquets, some thirty being handed to the members of the company.

The club realized $135, about four-fifths of what is needed for the show cases for the bowling and shooting trophies.

The Lily Trouble.

Great interest has been taken in the statement made by Mr. G. D. Clark that one of the customers of his firm, the H. A. Dreer Co., has succeeded in destroying the mite which attacks the lily bulb by soaking the bulb in a certain chemical preparation. The exact value of this preparation as a mite destroyer has not, I understand, been absolutely proven. The bulbs so treated did well. It is to be hoped that the mite can be destroyed without injury to the bulb, but there is no question that it would be better still not to have the mite at all.

While on this subject, I would like to say that my earnest effort to secure a guarantee of freedom from disease with lilies must not be construed as an attack on the importers of these bulbs. I honestly believe it is to their interest to get this guarantee and get it quickly. It hurts an importer to have it known that his stock turned out badly. No matter if it isn't his fault, the buyer naturally feels put out about it. Help us get this guarantee, gentlemen, and you will receive the florist's warm thanks and his cash, too.

While syringing the other day I was told a gentleman wanted me in the shed. He wanted to sell that so-called indelible lead pencil for use on wooden labels. After he had shown their merits, I told him I didn't use such pencils. He eyed me a moment. "Ah! you cannot write! You are the only man around here who cannot write!" With that he left. Perhaps The Review readers agree with him.

Flag Raising at Riverton.

Through the courtesy of the H. A. Dreer Company a representative of The Review was present at the flag raising at Riverton on Saturday afternoon, May 14th.

The ceremonies were opened with an address of welcome by Mr. William F. Dreer. Then Miss Bertha Eisele, daughter of Mr. J. D. Eisele, pulled the rope loosening a slipknot by which the ball of bunting was held at the top of the pole, 45 feet above the main shed. As the large flag unfolded, two hundred little flags fluttered to the roof below. Then the employes both from the place and the store, over one hundred in number, sang the "Star Spangled Banner," led by Mr. Thiel.

The speaker of the day, the Rev. Marshall Owen, followed with a patriotic address. At its conclusion "My County, 'Tis of Thee" was sung. The last speaker, Mr. Bookner, had not expected to be called upon and after a few words called for three cheers for the Rev. Mr. Owen, which were given with a will.

The ceremonies lasted forty-five minutes and were witnessed by about three hundred people. A supper given by the firm to the employes closed a very pleasant gathering marked by enthusiasm and good fellowship.

J. W. Y.

OBITUARY.

Thomas Cartledge.

Thomas Cartledge, the widely known and universally respected florist of Philadelphia, the head of the firm of Pennock Bros., of that city, died last Tuesday evening, May 17, at his suburban home in Holmesburg. For over fifty years Mr. Cartledge has been a leader in the trade of Philadelphia and his friends were legion, for to know him was to become his friend. No man in the trade was more universally respected than Thomas Cartledge, and the news of his death will be received with sorrow by the whole profession.

For many years Mr. Cartledge was treasurer of the Florists' Club of Philadelphia. He was always active in all that would advance the real best interests of the profession. He was a member of the Society of American Florists, and occupied numerous positions of honor and trust during his long business career. On the fiftieth anniversary of his connection with the business a banquet was given in his honor by the Florists' Club of Philadelphia, and the occasion was a notble one, the large attendance testifying in an unmistakable way to the exalted position he occupied in the hearts of his fellow craftsmen.

His name has always stood for the highest and best in manhood, and his death is a serious loss to every one who loves a noble nature. Emulation of his splendid example in both business and social life will be the most lasting monument to his memory.

CHICAGO.

The Market.

The market is well supplied with stock and since our last report there have been several slumps in prices. At present prices on tea roses range from $1.00 to $4.00 per 100, the bulk of the good stock going at from $2.00 to $3.00, and large quantities being lumped off at the lowest figure. Only the extra select shipping stock brings $4.00. Beauties range from $8.00 to $20.00 per 100. There seems to be plenty of extra long and short, but an insufficient supply of medium grades. Carnations range from 40 cents to $2.00 per 100, the bulk of the stock selling at from $1.00 to $1.50, only the very extra bringing $2, and large lots of lower grades being jobbed off at from 40 to 50 cents per 100.

Large quantities of lilac are now arriving and the crop will hold over to Decoration Day, as will a lot of other

View in the Wholesale Store of Mr. E. C. Amling, Chicago.

out door stock, such as Poets' narcissus, lily of the valley, etc., unless we should have some phenomenally hot weather between now and that date. Present indications are favorable for an unusually large supply of flowers for Decoration Day, and that the outdoor stuff will be of extra quality on acount of the cool weather we have had. Decoration Day prices on tea roses will be about $3.00 to $6.00, and on carnations $2.00 to $3.00.

Club Meeting.

The regular meeting of the Florists' Club will be held in room 417 Handel Hall Building, 40 Randolph St., tomorrow (Friday) evening. The subject for discussion is: "Sweet Peas and Plants for Summer Blooming."

Bowling.

The bowlers had another bout at the alleys at 77 Randolph St., last Friday evening. The high single score was again 188, but this time was made by C. W. McKellar. Following are the scores and averages:

	1st.	2nd.	3rd.	Av.
C. W. McKellar	149	131	188	156
E. F. Winterson	167	124	160	150
G. L. Grant	161	129	112	134
G. Stollery	106	141	147	131
C. Balluff	120	125	147	130
A. C. Kohlbrand	114	122	153	129
O. Kreitling	116	103	151	127
A. McAdams	167	99	104	123
Robt. Schenk	119	123	...	121
W. Kyle	145	101	103	116
J. Degnan	90	107	137	111
W. H. Kidwell	78	119	88	95
S. Snedeker	85	70	94	83

The next games will be played after the Florists' Club meeting tomorrow night.

Various Items.

Last Sunday President Gude and Secretary Stewart, of the S. A. F., were the guests of Mr. W. C. Egan, at Highland Park. They spent Monday in Chicago and left that evening for Cleveland, where they spent a day before proceeding home.

J. A. Budlong has opened his new wholesale store at 37 and 39 Randolph St. It is in the basement, but well lighted from the street, and it is being fitted up in good style. A. H. Budlong is in charge and reports good business from the start. John Zeck is on deck and gives the regulation grip to visitors.

John Michel has opened a floral store at 871 Lincoln Ave.

The Standard Floral Co. have a neat store at 2961 Wentworth Ave.

J. F. Kidwell certainly has faith in Pteris cretica albo-lineata, judging from the quantity he is growing. He grows a lot of other ferns and everything on the place is in fine condition. W. H. Kidwell now has a half interest in this establishment and is in charge, while J. F. spends most of his time at his place near Lafayette, Ind.

Vaughan, McKellar & Winterson recently received an importation of two and one-half tons of Italian wheat of extra fine quality. This firm is continually developing its department of florists' supplies. Charlie McKellar has "collared" both the American and Cuban flags, while Ed. Winterson carries the colors on his bald spot.

Kennicott Bros. Co. are receiving from Klehm's Nursery some gladioli, with stems four to four and one half feet long, and well flowered.

Mr. E. E. Peiser, of Kennicott Bros. Co., announces his intention to offer $20 in special prizes for carnations at the Chrysanthemum show. There will be first prizes of $3 and second prizes of $2 for 25 white, 25 yellow, 25 red and 25 mixed commercial seedlings. Mr. Peiser's idea is to encourage the smaller growers to compete.

Albert Fuchs is building five new houses, one 25x175 and four 25x75. He is growing a lot of palms, having 300,000 seeds in the soil.

Mr. A. McAdams reports that the spring plant trade has opened fully equal to last year. Among plants recently imported is a batch of Acacia paradoxa which he will offer next season as an Easter plant.

The stars and stripes now wave at Lincoln Park. They lay on the sloping lawn in front of the conservatories, but they wave just the same. The red stripes are of Alternanthera Lindenii, the white ones of Leucophyte Brownii and the stars are echeverias in a field of crushed blue stone.

J. C. F. Meyer had quite a siege of illness this winter, for several months being unable to attend to business. He is now about again and endeavoring to make up for lost time. He has the old Lewis establishment on Dunning street. Fred is one of the old-timers. He was foreman at the Miller & Hunt greenhouses when that establishment was an important factor in the trade in this city. He tried a bed of mushrooms under one of the benches this winter and was very successful, cutting over 100 lbs. of mushrooms from the one bed.

J. Austin Shaw, the Brooklyn Bard, and Alfred Orchid Dimmock, were recent visitors. Also Mr. N. J. Kraft, Rockford, Ill., the inventor of Kraft's Plant Tonic.

Bassett & Washburn will plant a house with Asparagus plumosus nanus to be grown for sprays. They find a constantly increasing call for these sprays, and will grow them instead of adiantums.

Little Ned Washburn, son of Mr. Washburn, met with a very unfortunate accident recently. While playing with some boy friends in a barn he was lifted up by them, and while trying to reach something overhead, caught his hand in a rusty wire hook that tore his hand badly before it could be disengaged. Prompt medical attention was given, and it is hoped no serious results will follow.

Paeonies are beginning to arrive from southern points, and there is lilac galore. Billy Lynch trims the stems of his lilac with his "little hatchet." It reminds him of that cherry tree.

A. L. Randall has returned from the West Baden Springs much benefitted in health.

O. P. Bassett's stay at the springs seems to have done him a world of good. He is the picture of good health.

SEND IN your order now for a copy of The Florists' Manual, by William Scott. It will cover the whole field of commercial floriculture and will be the standard work of reference for the trade. Price $5.00.

BOSTON.

Review of the Market.

With a few warm, sunny days the receipts of most everything in the flower line have been largely increased, thus bringing the state of the market almost to a summer standstill, and the fakirs are now in their glory, being able to obtain plenty of stock and almost at their own figure.

Carnations are still a leader, but at lower prices; common grades averaging about $1.50 per hundred; strictly fancies, however, still hold their own.

The quality of the roses coming in is first class, but the demand is light, with prices same as last week. Beauties and Jacks, of a strictly No. 1 grade, find a ready market, bringing as high as $4.00 per dozen for Beauties, while W. H. Elliott's two-foot Jacks are taken quickly at $3.00 per dozen.

Lilies have slightly improved during the week and the stock is generally cleaned up every day. Valley is still in good supply at $3.00 per hundred, while violets have shortened up considerably and are taken up by the retailers as fast as they come in. Other stock is slow at last week's quotations.

Trade at the Stores.

The wholesalers report business as quiet, being confined almost entirely to local buyers, while prices are about the same as are obtained on the open market. The shipping trade is considerably less than the average for this time of the year.

Among the retail trade business is variable, with the volume hardly up to that of a year ago. At Galvin's the demand seems to be for high grade carnations, the new Mrs. Thos. W. Lawson, controlled by them, being a leader. This firm is also very busy catering to the patriotism of their customers, as red, white and blue dinners are now quite a fad. Beauties and violets are the flowers used, being helped out with red and blue ribbons, the white of the tablecloth making the third color.

Doyle reports a good trade for American Beauties, of which he is carrying some excellent blooms, and is also quite busy with funeral work. He reports trade about equal to last year.

Both Newman and Zinn are doing considerable in design work, with a fairly good call for cut flowers. Everybody is looking forward to a rushing Decoration Day trade.

Plant Trade.

Plant growers are now very much in evidence, and are hustling to clean out their stock as quickly as possible, but are having a tough time considering the trade of former years; whether it is the war or the backward season is still a conundrum.

Down at the market the call is for geraniums, prices averaging about 10 cents, while pansies go slow and have been selling from $1.00 per dozen to 15 cents for a single basket. The weather is too cold yet for soft wooded stuff.

At the auction room most of the stock consists of pansies and geraniums, but the demand is not yet on and they have to be forced, selling at prices slightly below the average.

The Weekly Exhibition.

The Saturday exhibition of the Horticultural Society, while confined to only a few exhibitors, contained some very fine displays.

Messrs. R. & J. Farquhar & Co. showed a fine collection of narcissus, and were awarded a certificate for Narcissus Victoriae. Mrs. D. P. Richards made her usual exhibit of wild flowers, while Mrs. E. M. Gill and James Comley exhibited seasonable cut blooms. The pansies from the Fay estate were elegant specimens.

For novelties Mr. J. E. Rothwell exhibited Cypripedium bellatum var. album, which is an extremely rare plant, while Mr. Robert Laurie, of Newport, R. I., showed eight blooms of what he calls an ever-blooming chrysanthemum, named Independence. These were grown from cuttings taken Feb. 10th and flowered in 3½-inch pots. It looks a good deal like Mme. F. Bergman, which can be made to flower at almost any time by keeping it pot bound.

News Items.

Dudley Hartford is fitting up a store on Portland street, near the northern station. He intends to do a general florist's business.

The seedsmen report trade good, about the same as usual at this time of the year.

M. Rice & Co.'s salesman from Philadelphia, and Mr. Maynard, of the Jadoo Fibre Co., are in town.

The public gardens and parks are ablaze with gorgeous colored tulips and attract lots of visitors. P.

THE OMAHA MEETING.

President Gude, of the S. A. F., reports that arrangements for a successful meeting were satisfactorily concluded during his visit to Omaha last week.

The place selected for the meeting is the First Presbyterian Church, which has a seating capacity of 500, the seats arranged in tiers as in a theatre. The auditorium is very prettily decorated and the acoustics are good. He believes it will prove an exceedingly satisfactory meeting room. The exhibition will be held in the basement of the church, and all will be under one roof.

President Gude says he found the Omaha florists very enthusiastic about the coming convention and was certain they would spare no effort to make the annual meeting one of the most successful in the history of the society. He and Secretary Stewart were most hospitably entertained by the local florists during their visit and a very enjoyable banquet was given in their honor.

He was much pleased with the appearance of the Exposition grounds and buildings and believes the exposition will be worth a long trip to see and enjoy. He found the trip out and back very pleasurable and expects to find it equally so in August. He is confident that no mistake was made in selecting Omaha as the meeting place for 1898, and believes that the Omaha convention will fully equal in attendance and interest any previous meeting of the society. He anticipates a good attendance from the east and an unusually large number from western territory.

NEW YORK.

Among the Wholesalers.

Business looked quite roseate the early part of the week, but dropped into the old rut again by Wednesday and kept everybody guessing.

Beauties there are still in plenty and price ranges all the way from $1 to $20 per 100, according to quality and size of stem. Other roses are quite equal to the demand, but the quality is not so good, and, strange to say, ever since the battle at Manila, the stock has been more or less mil- "dewy." The flowers are good, but the foliage detracts from the beauty and value of the stock. Good, clean stock will average as high as $6.00 per 100, while the general run will realize all the way from $10 to $30 per 1,000, while "straight slips" are sold as low as $20 per 1,000.

Carnations are on the home stretch and quality and price are getting poorer. Sale was fair, however, the early part of the week, except for Portia and Daybreak. Scott is undoubtedly the most popular variety and best seller in the New York market today; in fact is from the day the season opens.

Violets are getting to be a back number and very little good stock is seen. Lilac there is in plenty. This seems to be very popular with the masses and is cheap, all coming from outside; price 2½ to 25 cents a bunch, according to size and quality. Gladioli are coming in and $10 per 100 is considered a fair price.

Valley received somewhat of a boost the last week, heavy funeral orders bearing the market somewhat. A little "frame valley" is to be seen and sells for $2.50, forced somewhat higher. Harrisii lilies are shortening up; price $4 to $6 per 100.

Cattleyas are getting more plentiful, the variety Mossiae being mostly in evidence; 50 and 60 cents apiece is realized for selected blooms. Quite a lot of sweet peas are to be seen and sell from 5 to 12 cents per bunch.

American Institute.

The usual monthly exhibition was held last Wednesday in the rooms of the above, and flowering shrubs, perennials, etc., were the feature.

Siebrecht & Son showed an excellent collection; noticeable were Doronicum plantagenum excelsum, the pretty Cercis japonica and Cercis canadensis, and a collection of Japanese maples.

J. Lewis Childs also showed a comprehensive collection. Conspicuous were Daphne Cnorum, Solanum Wendlandii and the saxifraga or Megasea cordifolia.

J. G. Aitken, Bayonne, N. J., and W. Turner, Tarrytown, also exhibited nice collections.

During the afternoon session Samuel Henshaw, of the new Botanic Garden, gave an interesting talk on hardy flowering shrubs and the evening session was devoted to a lecture on Colorado plant life by Mr. Cornelius Van Brunt, which was beautifully illustrated by stereopticon views, photographed by himself.

Notes.

J. H. Small & Sons have enlarged their store and have taken in the one adjacent. During the summer extensive alterations will be made so that it will compare with any of the finest in the city by next winter.

ST. LOUIS.

Club Meeting.

The Florists' Club meeting last Thursday was not well attended, as this is the busy season for the growers. Only about 15 members attended, including the officers. The meeting opened promptly at 3 p. m. with President Halstedt and all the officers at their stations.

The chairman of the exhibition reported that everything was progressing favorably and that the special prizes for the show to date amounted to $1,800. The indications are that the club will have the largest and best show ever held.

The committee on revising the constitution and by-laws must report at the next regular meeting of the club, if not a new committee will be appointed.

After a lengthy discussion in regard to the next S. A. F. meeting at Omaha the president appointed every member of the club a committee of one to see the different florists about town and endeavor to have them go with us, reporting at the next meeting the names of those who intend going.

Messrs. F. W. Ude, Jr., and Frank Fillmore brought carnations and roses for exhibition. The meeting adjourned until June 9 at 3 p. m.

Cut Flower Situation.

The situation in the cut flower market is about the same as last week. On Monday stock came in sparingly and we began to think the glut would subside awhile, but the next day and during the remainder of the week roses and carnations came in more freely each day.

Prices can not be quoted just now as all kinds of flowers are plentiful, the wholesaler selling them at almost any price to save them from the dump pile.

Botanic Garden Banquet.

The ninth annual banquet of the trustees of the Missouri Botanical Garden was held last night at the St. Nicholas Hotel. There were seventy covers and guests from abroad were present; provision in the will of the late Henry Shaw permits the trustees to invite literary, and scientific men, also friends and patrons of the natural sciences. The rooms and tables were beautifully decorated for the occasion.

During the festivities addresses were delivered by several of the distinguished guests. First was a tribute to the memory of him who founded the institution, "Services of Henry Shaw," by Chancellor F. H. Snow, of the University of Kansas; "Relation of the Ministry to the Tillers of the Soil," Right Rev. L. Coleman, Bishop of Delaware; "Garden of Science and Scientific Gardening," Prof. Conway MacMillan, of the University of Minnesota.

Bishop Coleman, on last Sunday, preached the flower sermon at Christ Church Cathedral upon the "Goodness of God as Shown in the Vegetable Kingdom," as provided for in the will of the late Henry Shaw.

Notes.

Considerable planting has been done this spring in our parks. Supt. Pape has pushed the work along so that the parks are nearly all in fine shape and attract the attention of all our visitors.

Lloyd Vaughan, of Vaughan, McKellar & Winterson, Chicago, is in town looking the picture of health. He reports business in his line better than ever. Mr. Vaughan is en route for West Baden Springs to look up some of his friends.

Ludolf Bauman, representing Frank Netschert, Chicago, spent a few days among the trade last week.

T. H. Brown, of Durant & Brown, Alvin, Texas, has been with us for a week. They are sending to this market a large lot of cape jasmines, of which they have 10 acres in Texas.

Charlie Wors reports that he is having excellent trade and even now with the great glut, some days he sells out clean.

Arnold Ringier, representing W. W. Barnard & Co., Chicago, arrived this morning (Tuesday) from the west. Mr. Ringier reports trade good.

The bowling club celebrated the fifty-first birthday of Fred C. Weber, Monday night, with refreshments and bowling four games of cocked hat. Mr. A. L. Vaughan, of Chicago, was a visitor. Kuehn rolled high, 128; Helwig second, 119, and Fillmore third, 110. The highest single score was by A. L. Vaughan, 47. J. J. B.

TRY AN ADV. in the Review if you have any surplus stock to sell to the trade.

KRAFT'S PLANT TONIC.

Some months ago a preparation called "Kraft's Plant Tonic" was called to the attention of Mr. C. J. Stromback, head-gardener at Lincoln Park, Chicago, and he was requested to try it. The claims for the article were so broad that he had but little faith in it and was with difficulty induced to devote time to the experiments. He finally did so, however, and has been amazed by the results. He is convinced that Mr. Kraft has discovered a really remarkable insecticide. He has given the following letter to the manufacturers:

Chicago, April 25, 1898.

Kraft Plant Tonic Co., Rockford, Ill.

Gentlemen:—I wish to inform you that for the past three months I have given your plant tonic a thorough test on different kinds of plants, infested with Aphis of various species. I find its process in killing insects is slow, but effectual and perfectly harmless to plants when used carefully. For hard shelled Scale on Palms and Sword Ferns, I used one-half solution and half water with satisfactory results. I used it on Orchids for the little White Scale, so well known among Orchid Growers; two ounces of solution to a quart of water applied with a sponge, killed the Scale in about forty-eight hours without hurting a leaf.

The little brown Mite that attacks the Harrisii Lily Bulbs and which makes such a wholesale slaughter among these beautiful plants, I find one-half solution, half water, poured into the bulbs kills the insects in about ten hours, without any danger to the plants.

To kill Mealy Bugs, the solution is best applied with a spray so that you can pierce the dry web that encases the bugs; half a pint of solution to one gallon of water is what I used with success on Coleus and other different plants.

To destroy worms in pot plants, also Wire Worm, I used half a pint solution to one gallon of water which killed the worm in about twenty-four hours without injury to the plants.

Gentlemen, I am perfectly satisfied with your preparation and I wish it every success.

A. J. SMITH, Ass't Gardener.

The statement as above set down by my assistant, A. J. Smith, is correct, as I have been watching the progress of the experiments with Mr. Kraft's Plant Tonic with interest. We have been experimenting with the same and I shall after this have the same on hand in our place.

Congratulating you in your success to get some remedy to help us in our troubles to destroy our pests, I remain,

Yours Respectfully,

C. J. STROMBACK, Head Gardener.

BALTIMORE.

Trade Unsettled.

Trade for the past few weeks has been in a very unsettled condition, and at present writing there is little or no outlook for its improvement. Transient trade and funeral work are at present about all our retailers have to depend on, as decorations are very scarce and weddings this month are a curiosity. Stock is plentiful, though not quite up to the standard in quality on account of unfavorable weather conditions.

The department stores are making a bold strike in bedding stuff. In our daily papers are seen flaring advertisements offering dazzling bargains in geraniums, coleus, etc., at "one-third" the prices usually asked by the legitimate trade.

To the uninitiated such startling inducements as "two, three and five cents per plant" are sufficient guaran-

tee; yet nine chances out of ten they do not get their money's worth even then. The public is thus given a wrong impression, however, which cannot help being detrimental to the regular trade.

Those Baltimore Street Cars.

It is indeed very lamentable, that our Buffalo caller, during his recent visit to this city, saw nothing that met with his commendation or approbation. Yet, it is not to be wondered at, when one takes into consideration Mr. W. S.'s actual experiences, as cited by him in the last issue of The Review. The rate of speed which this gentleman traveled from Philadelphia to Baltimore—some ninety odd miles in one hour — (a typographical error made this read 1 hour when it should have read 2 hours. Ed.) was for even such a swift man, a record breaker; and in itself, was sufficient to give our worthy friend his attack of acute indigestion and seasickness, not to even speak of the Eutaw House breakfast.

After taking into consideration his deplorable condition of "congested liver," one cannot blame him for feeling homesick when he saw the hack and cab drivers at Union Station. We therefore extend our sincere sympathy and heartily forgive him for his misplaced words of maledictions against one of the best equipped street car services in the United States.

As to our florists, the majority are "huddled together" on the principal streets simply because experience has taught them where the most business is to be done. If our northern friend would like to try his hand at opening up a "real modern store (as he terms it) in the residence district," I feel confident the craft of Baltimore will admire his nerve and should he starve to death will attend his funeral in a body. It would be well, however, to profit by his advice given our Mr. Sands, "to embark into business in another market." We sincerely hope that long ere this our genial friend has met several more of his "sixteen-year-old somethings" and is quite himself again.

There are several firms in town who would be pleased to furnish boutonnieres to the army at contract prices. In answering, please mention The Review. C. F. F.

BUFFALO.

New Store Windows.

The new store windows have been about the most exciting events in the florist line of late. Adams, Anderson and Scott have at last got settled down and are making a good show. In fact some of them, with their burlap walls, steel ceilings and fine windows, will be sure to induce others to be extravagant. Elegance and taste seem to be the accompaniment of a modern flower store. Why not? It is just the proper thing to associate with such dainty things as buds and blossoms. Hemlock boards to stand your palms on in a store won't do any more.

Plant Business.

The cold nights and much dull weather keep the plant trade back. Even this morning as I write (6 a. m., May 17), the grass in low places is frozen stiff. Market people are complaining, but it must come soon. With greenhouse men it usually comes all at once. Good, heavy buyers have learned that it is unsafe to plant tender stuff before the first of June, and then they all want it on the same day. Human nature, of course, but it has long since made us bald.

A Fire.

There was quite an extensive fire on Sunday morning, corner Mohawk and Washington streets. The Buffalo Cut Flower Exchange was in the building and Wm. Kasting's busy place is a few doors north, but he was entirely away from it, while G. L. Pickleman & Co. (the cut flower exchange) have lost most everything. I cannot at this moment say, but doubtless fully insured.

Simplicity in Greenhouse Construction.

During our long experience we have not only made many improvements in greenhouses, but we have so simplified the construction that building a greenhouse is no longer a matter so full of complications as to tax the patience and the ingenuity of even the most intelligent mechanic. Our

Clear Cypress Building Material

is worked out in the best manner ready to be put up, and we furnish our customers such complete detail drawings that any workman of only ordinary capabilities can put it up correctly.

Write for Circulars or Estimates.

Lockland Lumber Co.

LOCKLAND, OHIO.

WANT ADVERTISEMENTS.

FOR RENT—For greenhouse purposes, 32,700 feet on Michigan Avenue. Long lease and low rental. Room 922, 184 La Salle Street, Chicago.

SITUATION WANTED—As private gardener, by thoroughly competent man with the highest references from last employer and others. Removal of employer only reason for change. Address K. X., care Florists' Review.

SITUATION WANTED- As head gardener in private place or public institution. English, 52, widower (one daughter, 25). Thorough horticulturist, fruits, flowers, vegetables, landscape and ornamental work; 4½ years in Golden Gate Park, one year head gardener in present place. Best of references. Address, stating wages, etc., G. M. Stratton, Dungeness, Cumberland Island, Fernandina, Fla.

SITUATION WANTED- As propogator of general greenhouse stock, by a florist that is a good worker and strictly temperate. Good references. Address F. A., care Florists' Review.

FOR SALE—Six greenhouses, about 14,000 feet of glass; well stocked; wholesale and retail town of 4,000; no competition; less than 100 miles from Chicago; two railroads; good seed trade. For particulars address A, care Florists' Review.

WANTED—No. 1 grower of cut flowers; would like an expert on fancy carnations; good steady place for the right man. Address H. H., care Florists' Review.

SITUATION WANTED—A young man, 20 years old, desires position in cut flower store or greenhouses; has six years experience; good maker-up; best of reference, also security. Address H. C. H., care of Florists' Review.

WANTED—A good rose grower. Also a good man for orchids, ferns and palms, for commercial place. Address Minnesota, care of Florists' Review.

SITUATION WANTED—By an A1 grower of general greenhouse stock. Am 30 years old and single. If in need of a good man and are willing to pay fair wages, address M. K., care Florists' Review.

SITUATION WANTED—By an experienced gardener in landscape, nursery or pot flower cultivation; 25 years' experience. Only those willing to pay fair wages need reply. Address H. C., Florists' Review.

SITUATION WANTED—As foreman, good grower, single, age 30. Address N. T., Florists' Review.

FOR SALE—Four greenhouses, nearly new. Splendid retail stand in residence district on paved street leading to cemetery. Easy terms. Must retire on account of health. A. Claus, 501 N. 4th St., Springfield, Ill.

WANTED—By the 15th of June, a first-class all 'round florist to take charge of plant of 8,000 feet of glass. None but steady reliable man need apply. References. Wages $50 per month. Address X, care Florists' Review.

WANTED—A first-class grower who knows enough to run a place on business principles, to buy one-half interest and take full charge; must thoroughly understand the business. If dissatisfied with his purchase any time within one year he can have his money back. For particulars address A. H., care Florists' Review.

SITUATION WANTED—By expert grower of plants and cut flowers. Competent in every department. Seeks a situation where he may have a chance to make his services worth more than in his present place. Can surely advance his employer's interests if given suitable opportunity. Address S. D., care Florists' Review, Chicago.

To Rent! Eight greenhouses, all well stocked. 20,000 carnations planted out. Best place ever offered. All private trade.

MAX KRUSCHKA,
Lawrence, L. I., N. Y.

FLORISTS HAVING A SURPLUS OF STOCK CONSIGN SAME TO US.

VAUGHAN, McKELLAR & WINTERSON

45, 47, 49 Wabash Avenue, CHICAGO.

FOND DU LAC, WIS.

E. Haentze, of this place, controls one of the largest greenhouse plants in the state. He began operations here some 33 years ago, and by constant attention and in keeping up to the requirements of his improving trade has built up a large and lucrative business. His products are shipped all over the state and Northern Michigan. In addition to growing cut flowers, he also makes a specialty of growing plants and small fruits. He also has been very successful in growing seeds for the jobbing trade. Mr. Haentze is an enthusiastic member of the S. A. F. He is ably assisted by his three sons in the management of his large establishment. C. C. P.

HAIL NOTES.

The greenhouses of the Junction City Floral Co., of Junction City, Kansas, and of Wm. P. Ransom, of the same town, and those of A. B. Davis & Son, of Purcellville, Va., were struck by hail on the 11th inst. All were insured in the Florists' Hail Association.

MANCHESTER, N. H.—A. G. Hood has lengthened all his houses some 30 feet each to accommodate the capital stock he produces and intends adding yet more, the demand exceeding the supply, which is congratulatory.

IF YOU HAVE anything to sell to the trade, offer it in an adv. in The Review.

WASHINGTON.

Government Competition.

The Superintendent of Public Buildings and Grounds has never denied that he has and continues to loan government plants for private receptions and other purposes, while those in charge of the Botanical Gardens, when confronted with the fact that their wagon was followed from the gardens to a private residence in the northwest section of the city, explained that they were returning plants that had been left with them for hospital purposes. Here is still another abuse of that institution, Government greenhouses being used by private individuals and the service of government employes in growing these plants from a state of collapse into health again and returned after weeks of treatment to the owner at the government expense.

Now, we come to the Department of Agriculture. This department has always contended that no plants were ever allowed to go out for private purposes, yet only a few days back a prominent governor of a northern state, upon a visit to this city, was tendered a reception and dinner by a senator from the same state at a well known hotel, at which all the plants, with the exception of a few ordered from an uptown florist to fill up gaps, came from that department. With such powerful competition, where does the commercial florist come in?

A Patriotic Decoration.

At a dinner given in honor of Judge Day recently a feature of the decoration was a floral ship representing the Ship of State. The design was eight feet long and four feet high, made in pink. The body was made of pink carnations, railing of white roses and gun ports chenille. The table was adorned with rare vases and pieces of bric-a-brac filled with cut flowers and about twenty favors filled with sweet peas, etc. The favors were in many styles, stars, crescents, etc., intended for souvenirs to be taken away.

There were used 800 long-stem pink roses, American Beauties and Bridesmaids, and as many carnations, with several wagon loads of Farleyense and miscellaneous ferns, etc.

Business at a Standstill.

The weather the past week reminded us of a northeaster in February rather than May with a cold rain; thermometer below 40 degrees.

Business is at a stand still, even the market men, with their plant trade, report no business. It has been too wet and cold for planting and until good weather comes they see no business ahead. W. H. K.

WHENEVER you need any trade supplies not offered in our advertising columns, write us about it. We will place you in communication with some one who can supply what you want.

VASE FOR THE CEMETERY.

THE

Clara Cemetery Vase

Patent Applied for by Mrs. C. W. Pike.

A RECEPTACLE FOR FLOWERS, LONG NEEDED FOR THE CEMETERY.

THE **CLARA VASE** for use at the Cemetery is a handsome as well as one of the most useful articles ever placed on the market. It is absolutely a new thing and takes the place of all the old tin cans, bottles and various old truck that are usually found in the cemetery for holding flowers, and prove such a disgrace where everything else is beautiful and ornamental. It is composed of solid glass and stands about twelve inches high. The lower end is sharp-pointed so it can be embedded about six inches in the ground and stand firm. It will hold sufficient water to keep the flowers fresh and sweet, and will accommodate flowers with long as well as short stems. The VASE is bell shaped and the top has a diameter of about five inches.

The VASE is sold at a very low price and is within the reach of all classes. It is very strong and well made and can not be broken by rough handling.

Prices, delivered to railroad or express companies in Chicago:

One Dozen, - - -	**$3.50**
Three Dozen, at - -	**3.25**
Five Dozen, at - -	**3.00**

Samples sent on receipt of fifty cents (50c.) each.

These VASES will retail in the market for from 50c. to 75c. each, thereby giving the dealer a profit of over a hundred per cent. on his investment.

ROSE Plants

We have an extra selected stock of the following Rose Plants. Will guarantee them to be as fine as any grown.

		Per 100.	Per 1,000
American Beauty	2½-inch pot,	$5.00	$50.00
Brides	2½ "	3.00	25.00

KEENE, N. H.

Ellis Bros. adopt a plan to carry several thousand tulips for Decoration Day, when they are in good demand at 75 cents per dozen. When received the bulbs are planted in flats and set away in a cold cellar into which frost penetrates. They are kept there until about one week before May 30. La Candeur does remarkably well treated in this manner. I noted some elegant plants of Begonia metallica which reminds me of a picture I saw of one grown by Mr. Doughty, gardener to J. E. Hubinger, Esq., of New Haven, as a wall plant in a greenhouse. It was about 10 feet tall by 15 feet through.

The Messrs. Ellis raise capital stock in their well equipped plant of 25,000 feet of glass devoted solely to retail trade. A fine bed of the indispensable heliotrope for design work is worthy of special mention. W. M.

SHEBOYGAN, WIS.

J. E. Mathewson, florist, seedsman and nurseryman, of this place, is always up to date in the requirements of the trade. His greenhouses are well stocked with plants of all varieties suitable to his locality. For Easter trade his specialties were cinerarias and Harrisii plants, of which in the latter he has been very successful this season, having grown a large quantity, with apparently no loss on account of diseased bulbs.

Mr. M. controls a down-town store well fitted up for the seed trade, in which he reports a large trade this spring. Mr. Mathewson received the contract for the improvement of one of the largest parks, which will require the setting out of numerous trees. He is a native of Scotland and a gardener from the old school. C. C. P.

PULLMAN, ILL.—Hans Tobler has recently gone to Traverse City, Mich., where he will have charge of the greenhouses at the Michigan Insane Asylum.

ROSLYN, PA.—Mr. A. Farenwald, formerly of Wyncote, Pa., has recently started in business for himself at this place.

NANZ & NEUNER, - - - Louisville, Ky.

WANTED - ROOTED DAYBREAK CUTTINGS.

Address K, care of Florists' Publishing Co.

CINCINNATI.

Cincinnati Florists' Society.

The regular monthly meeting of the Cincinnati Florists' Society was held last Saturday evening, with a fair attendance. Henry Wellmann was elected to membership in the society.

The banquet committee made their report through Henry Schwarz, who stated that all arrangements had been completed and that thus far only 37 had signified their desire to attend. All who wish to be present on this festive occasion should notify the committee in charge without delay. The banquet will take place at the club rooms on Wednesday evening, May 25th, at 8 p. m.

President Witterstaetter was authorized to procure suitable medals to be awarded to the winners in the exhibition contest. A vote of thanks was extended to the out-of-town brethern who have contributed so liberally to the success of these exhibitions during the past season.

The Exhibition.

The display of plants and cut flowers was equal to any previously given by the society, although the only exhibitors were A. Sunderbruch's Sons, City Greenhouses, and Henry Schwarz. The latter had a fine collection of coleus showing good color, while the others did their best to surpass each other in their respective displays.

A. Sunderbruch's Sons succeeded in being first, with 23 points to spare. Their display was an excellent one in every sense. They had a fine collection of cut stock, principally roses and carnations. Notable among their plants was a specimen of Santilobium cicutarium, also specimen plants of Pandanus Veitchii, Metrosideros semperflorens, Dracaena fragrans and D. indivisa. They also had a nice collection of ferns, among them some well grown Nephrolepis exaltata Bostoniensis. Among their blooming plants I noted some fine hydrangeas, which were greatly admired.

The City Greenhouses had a beautiful collection of orchids. Notable among them were Cattleya Caudatum, Odontoglossum citrosmum, and Cypripedium Lawrencianum, which proved quite an attraction. They also had a collection of fancy leaved caladiums, which made a beautiful display. Their calceolarias were well done and received their share of praise. B.

MADISON, N. J.

Club Notes.

Three more new members were proposed at the regular meeting on Wednesday night and there was a good attendance on hand, with a fine showing of flowering shrubs and hardy flowers.

The details of the monthly exhibitions having been worked out, the report of the committee was accepted as presented. The regular competition will commence with the June meeting. There are five classes arranged for. Roses and carnations, stove and greenhouse plants, and cut flowers; hardy perennial, bulbous and annual garden flowers; fruits and vegetables; wild flowers, ferns and grasses. A silver medal is the premier award in each class.

Mr. J. Davies read an excellent paper on the Gloxinia, of which there were some good plants on show at the meeting. He detailed the culture from the seedling up to the flowering, and claimed that if the plants were inured to more airy and less shaded conditions when the flowers began to expand it would be found they were much more enduring, and thus treated he had found them lasting and thoroughly satisfactory as house plants and to use as cut flowers, the blooms lasting for several days.

He deprecated overhead spraying at any time and was confident that this combined with high temperature and too much shade caused the leaf disease that sometimes troubled the grower and disfigured his plants. A free use of the hose between the pots and upon the benches was advisable, but healthy leaves could not be expected if frequently drenched with water.

MARSHALLTOWN, IOWA. — The greenhouses formerly called the Riverside Greenhouses and owned by Mr. Van Schaick, have been sold to F. H. Fenner and the name changed to The Marshalltown Floral Co. Mr. Fenner intends to make considerable improvements about the place and also add a small house for palms and ferns. He also will grow more roses than were formerly grown at this establishment.

YOU CAN BUY all your trade supplies to the very best advantage from advertisers in The Florists' Review, and at the same time advance the interests of your paper.

The Model Extension Carnation Support

QUEENS, N. Y., Feb. 16, '97.
MR. THERON PARKER. Brooklyn, N.Y. Dear Sir:—I have tested your latest Model Carnation Support, and am free to say that I consider it the best wire carnation support that I have ever seen. It is quickly and easily applied, and I think will prove very durable, and you certainly deserve great credit for the invention.
Very truly yours,
C. W. WARD.

FLATBUSH, BROOKLYN, N. Y., Feb. 18, '97.

Dear Sir:—Your wire stake is certainly a gem. Without hesitating we endorse it as an up-to-date Carnation Support. Yours truly,
DAILLEDOUZE BROS.

W. HOBOKEN, N. J., Feb. 18, '97.
MR. THERON PARKER, Brooklyn, N. Y. Dear Sir:—It gives me much pleasure to congratulate you upon your success in getting up Carnation Supports. I think that those I have had from you are about as perfect as anybody will be able to make them. They certainly fill my bill for an ideal carnation support, a thing I have been looking for for a long time. Wishing you every success in the sale of them, I am,
Yours truly, E. ASMUS.

EVENDEN BROS., Williamsport, Pa.

KANSAS CITY, MO.

Terrific Hail Storm.

Last Saturday at 6:30 p. m. a hail storm, the most severe ever seen in this part of the country, destroyed all of the greenhouses in Kansas City. They were simply "Deweyized," and instead of the "Spanish" gone, the greenhouses are gone. "Heaven protect what are left," for such a storm as we had is beyond description. Also thousands of lights throughout the town were broken. S.

A terrific hailstorm visited this city on Saturday, May 14, about 6:30 p. m., which caused great destruction to everything in its path. All the greenhouses in the city and vicinity suffered terribly from its destructive force. The Humfeld Floral Co. lost no less than twenty thousand square feet of glass. Nearly all the other florists lost in proportion to the size of their place, and no correct estimate can be given of the losses at this early date.

Besides from hail and broken glass, the stock suffered much from the heavy rain which fell immediately after the hailstorm. Some of the florists say they will not rebuild.

The average size of the hailstones was from eight to nine inches in circumference and some weighing 8½ to 9 ounces. Trees, shrubs and spring plants just out suffered much.

Slate roofs were broken and pieces sent flying in all directions; skylights varying from one-fourth to one-half inch in thickness were broken like so much single strength glass.

E. A. B.

HUNT'S REVIEW OF THE CHICAGO MARKET.

The past week has been uneventful. More flowers were on the market than during the preceding week and the demand was slightly improved, not sufficient, however, to effect any advance in prices. On the contrary price on some things weakened considerably. Sweet peas are plentiful, and price is on the decline. "Old Red" paeonias are coming in quite freely from southern points, and while prices realized are below those of former years they are selling fairly well.

The call for choice Beauties has somewhat improved and strictly fine Brides, Maids and Meteors bring a fair figure. The warm weather, however, is making its presence known in the constantly decreasing size of both rose and carnation blooms.

In carnations, whites are not overabundant, the pinks plentiful and the reds while in no very heavy supply as to quantity are not wanted by the store trade. They are worked off by the street vender, otherwise 75 per cent of them would find their way to the dump.

On the whole the volume of business is ahead of a year ago, but the immense amount of flowers to be handled makes the condition seem bad.

Every indication points to an unusually large Decoration Day business. The supply will probably be good, except on white carnations.

THE FLORISTS' REVIEW.

Always mention the Florists' Review when writing advertisers.

TORONTO.

Some of the finest funeral designs this city has seen were made up last week, the occasion being the funeral of an eminent lawyer and member of parliament. It is an ill wind that blows no one any good, and it was a fair wind for the design trade last week.

I omitted to mention the May meeting of the Horticultural Society in my last week's notice. It was very well attended, especially by the ladies. A paper written by Mr. A. H. Ewing on the "Flower Garden" was read by Mr. Thos. Manton. It paid particular attention to color combinations in planting the garden. Mr. Manton also gave ocular demonstration as to how to fill a hanging basket, and did it in his usual interesting style. Potting shed facilities were wanting, but Tom took off his coat to it, and made a first class job.

The Public School Chrysanthemum Show business was advanced a stage. A very pleasant and interesting meeting altogether.

Mr. F. G. Foster, of Hamilton, was present, but was unfortunately unable to speak through sickness. I am glad to say, however, that a day or two after he was able to converse freely, and was around visiting the boys.

This has been an ideal Spring, and everything is looking its loveliest now. The bedding out season will begin next week, and there is every probability that a much larger quantity of plants than usual will be put out. Prices are a little higher at present than last year, and I believe if nobody funks, they can be kept up and stocks can be cleaned out. Don't funk. E.

"CONSISTENCY."

Philadelphia, Pa., May 14, 1898.

G. L. Grant, Esq., Editor Florists' Review, 530 Caxton Bldg., Chicago, Ill.

Dear Sir:—We yesterday received an order for a ton of Jadoo Fibre to be delivered to Mr. A. Blanc, 48th and Walnut Sts., Philadelphia. When our carter arrived with it at Mr. Blanc's place his receipt was signed by Mr. Blanc and the carter was instructed to deliver the ton of Jadoo Fibre to Messrs. Robert Craig & Son, 49th and Market Sts., Philadelphia. These are the same gentlemen who could not find any virtue in "Jadoo," and it was too expensive for the grower to use. "Consistency, thou art a jewel!"

See page 919, American Florist, March 19, 1898.

You can use the above information in any way you see fit. Yours truly,

THE AMERICAN JADOO CO.

Azaleas, Bay Trees, Araucarias, ..Palms

TUBEROUS ROOTED BEGONIAS

Make one of the finest pot plants for retail sales that florists can handle. There is still time to start them, if it is done at once. Bulbs placed in sand or damp sphagnum, and put on hot water pipes or in mild hot-bed, will grow immediately and be ready for sale within a month or less. Four separate colors—white, pink, scarlet and yellow. In order to dispose of stocks remaining on hand, and close out stock quickly, we offer these bulbs at a reduced price—

Only $2.50 Per Hundred.

These are not second sized bulbs, but first-class stock in every respect.

ORDER QUICKLY BEFORE STOCK IS EXHAUSTED!

We offer the

FINEST COLLECTION OF DAHLIAS

to be found in this country. ALL THE BEST CACTUS or DECORATIVE SORTS, LARGE FLOWERING OR SHOW, SMALL FLOWERING OR POMPONE, and SINGLE.

NEW HAVEN, CONN.

Flushed with the season's success, Smith T. Bradley is adding a house, 70x20, for carnations, and overflowing with patriotism, has planted in the center of his place a 50-foot flagstaff from which "Old Glory" will wave continually in striking contrast to Tidal Wave, which once flourished here, but has now floated away forever. A new wagon blossomed at Easter and added eclat to that festive season. It is a beauty and drawn by a fiery steed creates much attraction.

Spring, gentle spring, is upon us, and after our usual dose of sarsaparilla, with what pleasure we survey Nature as she bursts upon us in foliage and blossom, especially the delightful Magnolia soulangeana and conspicua, the fiery Pyrus japonica, Forsythia viridissima and suspensa, the numerous varieties of spiraea and other flowering shrubs, the cultivation of which we are glad to observe is on the increase.

Mr. J. E. Hubinger (J. Doughty, gardener) is adding a handsome conservatory. Hitchings has the contract and also for many other similar structures, so that whilst the business is not so brisk as we would like to see it at this season, there are those who do not fear damage of broken glass by the shot of the enemy.

Mr. Doughty has among the many well grown plants some pretty specimens of fuchsia Mrs. Marshall. A few such trained in various shapes are ever acceptable in a greenhouse. There are also some lovely forms in the newer kinds of Rex begonias.

W. M.

GRAND RAPIDS, MICH.

Business the past week has been flat, stale and unprofitable. The long delayed glut is on hand. Flower patrons are now more interested in war news than flowers. In carnations white seems to be scarce; other varieties plentiful.

There are some exceptionally fine hydrangeas in town, but as yet no one seems inclined to buy them. However, they will keep till Decoration Day, when we anticipate everything will go. Planting carnations in the field is about over and everyone praying for rain. The repotting, final handling and spreading out of spring stock is about finished, the decks are cleared for action and now all hands will receive orders to bombard every vase, hanging basket and box that comes within range. If high grade $1 a basket ammunition will not answer, then the 35-cent torepdo will certainly blow the order in. Whether the war has any effect on business or not is as yet a mere matter of opinion, but there is not a florist in this bailiwick but who predicts for himself the largest spring trade he ever experienced.

GEO. F. CRABB.

DREER'S Special Offer of...

Seasonable Plants

30,000 Ampelopsis Veitchii We offer a fine lot of strong 3-in. pot, one-year-old pot grown plants, 18 to 24 inches high, $6.00 per 100; $50.00 per 1000.

Rudbeckia Golden Glow One of the best hardy perennials. Excellent as a show plant for the border, and invaluable for cutting through the summer and fall. Strong, 2¼-in. pots, 50c per doz.; $4.00 per 100.

Double Petunias Our unrivaled strain. A fine lot in 3-in. pots, mixed unnamed varieties, $5.00 per 100.

Dracaena Indivisa A fine lot of 5-in. pots. A good size for medium sized vases, baskets, etc., $3.00 per doz.; $25.00 per 100.

Dracaena Bruanti Another useful variety for vases. baskets, window boxes, etc., 4-in. pots, 12 inches high, $3.50 per doz.; $25.00 per 100. 5-in. pots, 15 inches high, $4.50 per doz.; $35.00 per 100.

Dracaena Godseffiana The most striking foliage plant introduced in many years. It rivals the Aspidistra and Rubber as a house plant. Strong plants from 4½-in. pots, $3.00 each; $30.00 per doz.

Deutzia Lemoinei The best hardy plant offered this season. A great improvement on D. Gracilis, which it will soon supercede, both as a plant for the garden and for forcing. 3-in. pots, $2.00 per doz.; $15.00 per 100.

New Dwarf Bedding Geranium "Mars" A distinct and useful pot or bedding variety. 2¼-in. pots, $1.00 per doz.; $8.00 per 100.

Microlepia Hirta Cristata It is seldom that we are in a position to offer this valuable fern in quantity at low prices. We consider this as useful as the Nephrolepis for growing into specimens. It is of rapid growth and a good hardy house plant. $1.00 per doz.; $8.00 per 100; $70.00 per 1000 for good 2¼-in. pot plants.

Cycas Revoluta Dormant stems. A fine lot weighing from 4 to 50 lbs. each. 10c per lb. in lots of 250 lbs. or less. Special prices on larger quantities.

HARTFORD, CONN.

Our friend Coombs has a touch of war scare and has dispelled, for the present anyhow, the plans he had on the board to make considerable additions to his fine plant. Don't be unnecessarily alarmed, Brother John, but let the good work proceed and make use of those healthy violet runners the writer saw at time of his visit.

Geo. S. Osborn intends experimenting with carnation Jubilee inside during the summer. He has a grand lot of Bradt, Daybreak, Scott, Triumph and Flora Hill, and is going to try to solve the problem of getting in crops when other growers are off. A handy palm house, 50x20 feet, has recently been added, heated with hot water (Hitchings). W. M.

GO-OPERATION

IF you are in the trade and are not yet a subscriber to the FLORISTS' REVIEW, send in your name and one dollar now and you will receive not only the FLORISTS' REVIEW for one year, but also a certificate entitling you to the earnings on one dollar's worth of stock in the Florists' Publishing Co.

Why do we make such an unparalleled offer? It is very simple.

You will have an interest in the success of the paper.

You will see that you can buy everything you want to just as good advantage from advertisers in the FLORISTS' REVIEW as elsewhere and at the same time benefit yourself by increasing the earning power of your certificate.

This mutual arrangement cannot fail to bring to the paper a heavy advertising patronage, and as a result the stock represented by your certificate will earn good dividends.

And the more you buy of advertisers in the FLORISTS' REVIEW (always mentioning the paper), the larger your dividends will be.

You get the best paper in the field and a share of its earnings.

Send in your subscription now.

FLORISTS' REVIEW

COPYRIGHT, 1898, BY
FLORISTS' PUBLISHING CO., 520-535 Caxton Building, CHICAGO.

Vol. 1. CHICAGO AND NEW YORK, MAY 26, 1898. No. 26.

EUPHORBIA COROLLATA.

This flowering spurge is found wild along the railroad banks and in dry open fields throughout Illinois and undoubtedly elsewhere. It is the only one of the six representatives of the family indigenous to Cook County that is worthy of cultivation. When brought into the garden and given but ordinary cultivation it furnishes one of the most useful cut flowers we have, as its staying qualities are excellent.

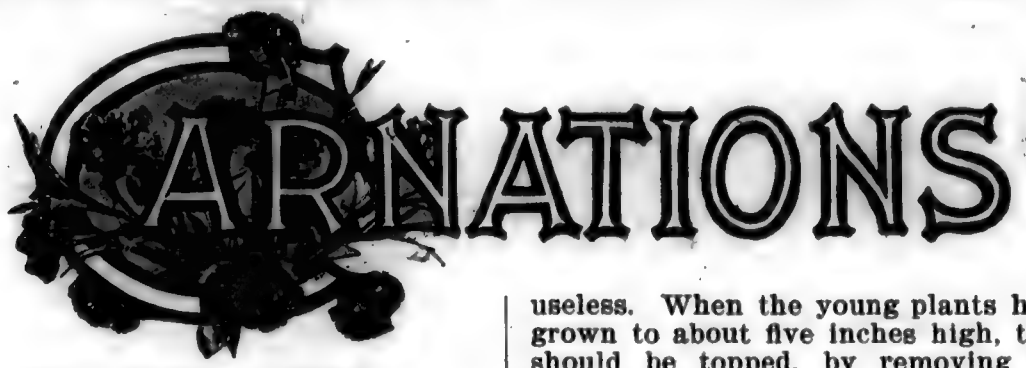
It might be termed an all-summer bloomer, especially if some of a planting be somewhat retarded by being placed in a partially shaded situation. Its flower stems rise about two and one-half feet. These generally send out at the top fine wiry branches, each of which again branches into three or more smaller stems, that once more send out dividing branches, each of which bears panicles of very small white flowers. The top whorl of one main stem must contain somewhere near 280 of these small white flowers, all held nearly clear of each other. At the base of these dividing stems are placed small light green leaves, which with the green furnished by the wiry stems, produce all of that color needed in decoration. Side branches, all divided, and panicled as above described, start from the main stem at intervals from the bottom up.

This flower can take the place of Stevia. It is perfectly hardy and not at all particular as to soil.

BELLEROPHON.

Euphorbia Corollata.

VIOLET NOTES.



Our notes of late have been somewhat like our weather, "very uncertain." After numerous delays we have at last succeeded in "dodging the drops" and have put out part of our stock. It is very difficult to get them out properly, as it rains so much the ground is not in a fit condition to work, and in three or four hours, the heavy winds which accompany the clear weather make it too dry on the surface. However, we are pushing matters at every opportunity now and hope to have finished the work in a few days.

Then we shall commence to run the hand cultivator at once. Do not delay this, as the weed seeds start very rapidly, and if neglected for only a short time, will be too well established to be entirely destroyed by the cultivator, and the consequence is hand work must be done which is both tedious and expensive. Extra care must be used at first in running the cultivator that the plants are not disturbed in any way, until they get established with a firm hold on the soil; when established you may run quite close.

Our notes will probably be irregular for some time to come, as the principal thing for the violet grower should now be for weeks to come to thoroughly cultivate them and commence and go over the patch again, then examine it, and again grasp the cultivator and proceed

to "do it" again, and to keep at this with very little interruption through the whole season. A few days' carelessness and inattention at any time will allow them to get such a start that you can hardly catch up again during the season, and besides does much harm.

In reference to the stock for experiment, which we mentioned in our last notes, it is really amusing to see the difference in the prices, and what constitutes "rooted runners" with different growers. I am not sure but that a conference of violet growers would be of value if they would agree on some of these things, so that one would really know what they were going to get when ordering by mail. R. E. S.

FIELDWORK—TOPPING.

If we would allow our plants to grow at will in the field, the result in the case of free blooming varieties would in a short time be a stem and flower, without showing much tendency to branch and lay the foundation for a bushy, branching plant. It would do this, too, after the first flower is developed, but to let it bloom would retard the development of the plant to the desired form and size for work when housed again in the fall.

The detached cutting is a part of a matured plant, ready to bloom, and this tendency to bloom, interrupted by the process of rooting and the formation of a new plant, is again evident as soon as the new plant is able to perform the function of assimilating food; in other words, when in a growing condition. This process of growing to size is very much retarded when the young plant is allowed to bloom. It is a check to its growth. All the strength it possesses and all the food it is able to absorb from the soil is used and centered in the effort to produce and mature that flower, and all other growth, the branching out to a larger plant, is stopped, until that effort of maturing the bloom and ripening the seed are accomplished.

This is common with all free and continuous blooming varieties. True, there is not much seed developed in double flowers on account of their imperfection regarding the sexual organs, but the tendency to develop the blooms is the same, and insects, the agents which affect fertilization, are profuse during their summer growth.

We have two objects in topping the plants. The first is to prevent the young plants from blooming, thereby spending their strength in an undesired direction, and second, to give the plants the desired form. These two objects are so closely linked together that if one is observed, the other will not be missed. The whole object is to grow good plants for winter blooming.

The process of topping the plants is a very simple operation, and should not be neglected, for any cutting away afterwards that may be necessary is useless. When the young plants have grown to about five inches high, they should be topped, by removing the heart of the plant, stopping its upward growth, and forcing it to branch. We are often compelled to top it lower, when a flower stem appears below, for a flower stem should be removed as near as can be determined at its base. When only a part is removed, the remaining part will break forth and form other buds, and thus the object of forcing the plant to branch is lost.

When the young shoots, two, three, or more, depending on the strength of the plant, have grown to about four inches, they should be topped again in the same manner. After this, when the plant is not checked in its growth by some cause or other, the branches will at least be doubled after the second topping, and from now on the growth will be more uneven; the sign of maturity, the tendency to bloom, becomes more apparent. While some shoots seem apparently inactive, others push on to bloom, and our attention is only called to these; to top them whenever they appear, to give the plant a nicely rounded form, and force it to save its strength for the ordeal of being transferred to the house, and its subsequent blooming. With a judicious topping during its field growth, we force the plant to grow and lay the foundation for its winter work.

Do not neglect your other work; keep the cultivator going; have the ground in shape for any protracted period of dry weather. On a careful summer culture depends the success of the plants during the winter. If stem rot appears, remove the plants at once and destroy them. I would recommend the same in the case of rust. If the plant cannot be spared, cut away the affected part, and prevent the spreading of the spores to the adjacent plants. With spot it only needs the pinching of the affected leaves. If these diseases are given attention in the start, a few hours' work in time will save days of labor afterwards.

FRED DORNER.

TRY AN ADV. in the Review if you have any surplus stock to sell to the trade.

PLANTS FOR SUMMER FLOWERS.

This was the subject for discussion at the meeting of the Chicago Florists' Club last Friday evening. When leading retail florists, such as Messrs. C. A. Samuelson and P. J. Hauswirth, were asked what varieties of summer-grown flowers were most salable, they responded very discouragingly, stating that nowadays there was very little call for any kind of flowers during the summer months aside from what could be used in an occasional funeral order. Mr. Hauswirth suggested as the most useful flowers white and lavender asters and gladioli of light shades, and Mr. Samuelson agreed with him that these would be most apt to bring money to the grower.

Speaking for the wholesalers, Mr. McKellar stated that asters, campanulas, cosmos and coreopsis sold fairly well in their season. In regard to campanulas Mr. G. Swenson stated that he had been quite successful with them and that they had been fairly profitable. He sows the seed in June and grows the plants outside all summer. They are then carried through the winter with simply a covering of slough grass. He grows the pink and white single sorts, which sell very well at 35 cents per bunch.

Mr. C. J. Stromback thought that tuberous begonias and gloxinias should be profitable summer pot plants for the florist to grow, and that they could be handled in a shaded frame better than in a greenhouse.

Mr. G. Stollery told of his attempts to grow sweet peas, which had met with failure on account of the plants being attacked by club root. With him they generally died out in June. Another grower suggested lime in the soil as a remedy. Mr. Stollery had also had considerable trouble with the McGowan carnation being affected with club root in summer. He explained that cabbage and celery had been grown for many years on the ground he now occupies, and he thought that the club root might be due to the germs in the soil from the old cabbage crops. Mr. Stollery is also hunting for a means of eradicating grasshoppers. He says that of late years they have done very great damage in his vicinity. Last summer they ate up 1,500 carnations in the field for him. A flock of chickens or turkeys was suggested as a remedy.

Mr. Oscar Kreitling, a retailer, suggested an increase in the number of light colored gladioli.

Mr. J. T. Anthony thought that white carnations were as good a summer crop as could be grown, and that Wm. Scott was also a good variety for the purpose. He made it a practice to grow quite a number of pot plants of carnations for spring sales and the left over ones were planted out for summer flowers. These plants were propagated in October and were kept in a pot not exceeding 3 inches in size till February or March. They were then shifted to a 4-inch pot and sold. He found that when some were left over

they paid very well in furnishing summer flowers. He stated that the late Mr. N. Singler often said that he made more money out of carnations grown outside for summer flowers than from those grown under glass in winter. The way he handled the plants they began blooming by June 1st; by August all the other growers would have outside flowers, but in the meantime he was the only one who could furnish them, and he therefore reaped a harvest.

Referring to sweet peas under glass, he had cut flowers as early as Jan. 22, and said it was very easy to get them in good bloom by Feb. 1. He had had 300 or 400 in pots, and these were the earliest. Some planted in a raised bench, where violets had been grown, string and were about two feet tall. They were planted in rather poor soil.

Referring to asters, he had found them very profitable when not affected with disease. At his city establishment he had lost four-fifths by disease, but when at Bowmanville he had had very good success on a piece of apparently very poor ground, while plants put out at the same time in a good, rich piece of ground were practically all lost through disease.

ZINNIAS.

[From advance sheets of the Florists' Manual, by William Scott.]

The annual zinnias are the only ones in which the florist is interested. With

Zinnias.

but which had been thrown out on account of club root, had bloomed by Feb. 1, while others planted in a solid border in November had not bloomed until May. His experience had taught him that the sweet pea should be planted in October and then left outside way into November after hard frosts had come and the wood was thoroughly ripened. If planted inside the plants make a soft growth and bloom late. The soil should be rather poor to produce the best results, and the temperature about 45 degrees. He had tried the sweet pea as an Easter plant and it had been very satisfactory. He had sold some good pot plants at Easter at $1.50 each. These plants were in 5 and 6-inch pots and the peas were trained with stakes and selection and culture, they are now among the handsomest of our annuals for the border, and in certain places a whole bed of them, in many shades, is very striking.

They are very easy to grow and need only the ordinary treatment given many other annuals, except that no frost must ever touch them while in a cold-frame. Sow from the middle to the end of March, and when an inch high transplant into flats two inches apart. By the middle of April a cold-frame is the right place for them. Plant in beds or borders after there is no danger of frost.

They are strong, rampant growers, and should have plenty of room; eighteen inches to two feet apart is close enough. They should have a well tilled piece of ground and will then stand our hot, and often dry, summers better than most of our summer flowering plants.

While the zinnia well deserves a place in the flower garden, it is the most unpopular of all flowers for even the cheapest sort of a bouquet. The poorest purchaser does not want them at any price. We have noticed this so often that we never cut them, however short of cheap flowers we may be. This proves that there is an unconscious taste for the artistic, even among the most lowly. The zinnia is so absolutely regular in form, stiff and formal, one flower being exactly like another, that the eye rebels against it. In a bunch of roses, carnations, or almost any other flower, no two are precisely alike, but the zinnias look as though they all came out of one mould. Then again, the stem is so rigid that while it is all right on the plant, it detracts from the flower when cut.

Grow zinnias to make your border gay, but don't offer the cut flowers to your customers. We raise quantities every year and sell the young plants from the flats at 25 cents per dozen.

THE USE OF FRAMES OVER HARDY PLANTS.

The recent heavy and continued demand for funeral designs here in our town caused a decided run on white flowers. Some firms were at times unable to procure enough flowers on

short notice for all their customers, and frequently had to decline late orders. It may not happen very often that such conditions occur, but are we not often apt to neglect available opportunities to prepare for such emergencies, especially in the spring, when so much work is on hand, inside or outside, and minor items are lost sight of? If we have a patch of evergreen candytuft planted out anywhere in the garden and would set a sash frame over it, banking up the sides if this be thought advisable, about March 1st, or, in fact, at any time before they are ready to bloom, we get the flowers out weeks ahead of the regular outdoor crop, and the snow-white flowers are a great help, not only when there is a general scarcity, but they are useful at all times. When fairly out, the sash may be removed entirely and then the bed will last in a perfect state for many weeks. The flowers need not be cut all at once, or as soon as well developed; they are just as good four weeks later if left on the plants.

An advantage, which must not be underestimated, is that this same bed, without replanting, is good for ten or fifteen years, perhaps longer if well taken care of. After flowering, the bed should be gone over, shearing the plants back severely and evenly, and to encourage vigorous growth for the coming year's flowering, a top dressing of rich compost will be of great benefit. The ordinary evergreen species, Iberis sempervirens, is the earliest, blooming outdoors and unprotected in May with us, but we can have it in flower early, or under adverse conditions, by the middle of April under this simple protecting treatment. The broader leaved and more compact growing I. correaefolia is considerably later, but its flowers are broader, larger and more flattened. It is very useful for working up in designs in its time, but requires some artificial heat to bring it out early.

Another plant which will submit admirably to the frame treatment and be in full bloom even sooner than the candytuft, is the white Arabis alpina. The flower heads are rather larger than those of the iberis, but more loosely arranged. Its lasting qualities are good, and we consider it very serviceable material for design work. It requires replanting every third or fourth year, but is a very free blooming plant, desirable for all purposes, and does invariably well in all localities and in all soils, poor or rich, sand or clay. Protecting frames, set over a bed of hardy plants in early spring, are recommended for bringing out the flowers a few weeks ahead of their regular time. The fringed June pinks, for instance, can be advanced without difficulty for Decoration Day, also some of the early aquilegias, campanulas and other things suitable for cutting, which, under ordinary circumstances, would not begin to bloom until the middle of June.

I am quite sure that the average florist, who, being situated in a medium sized town or city, dependent largely on what he can grow on his own place, can in this manner provide an ample supply of desirable flowers for Decoration Day, while without the use of the frames it would be difficult and perhaps very expensive for him to obtain sufficient stock to satisfy all his customers.

J. B. K.

PLACE OF A TOPEKA FLORIST.

The engraving shows the establishment of Mr. James Hayes, Topeka, Kansas, the leading florist in Topeka, a city of fine, broad streets, and it is one of the neatest, most substantial and best arranged places the writer ever saw.

The rose house is three-quarter span, 20x125 feet, running east and west. The north wall is 8 feet high and the south wall 4 feet high, built of stone, a most substantial piece of work. The palm house is between the shed and rose house and is 20x24 feet. The plant houses are 18x75 feet, running north and south (three of them). The entire ground occupied by these three houses was excavated to a depth of 4 feet, and a solid stone wall built all around the outside to 18 inches above ground, on which rest the gutters, and the center walls are also of stone; in fact, it would be impossible to have houses more substantially built. The boiler pit and potting shed are well built and very convenient. The stable is also on stone foundations, with good cellar underneath, and contains two good horses, two Jersey cows, room for one buggy, one phaeton, one delivery wagon, and one light cart for delivering in muddy weather. Everything is housed and kept in good repair. His son, a young man going to college, is a great pigeon fancier, and has some very fine and rare birds.

The residence is the second one built by Mr. Hayes, the first one having been burned to the ground some three years ago one very cold night, but very fortunately was insured for $2,000. The present one was built at a cost of over $3,000, and from the cellar to the attic is most substantially built, containing nine rooms and a bath room. The residence and greenhouses stand on four acres of ground, with not a dollar of incumbrance on the whole place. Mr. Hayes was until some ten years ago a private gardener, receiving his training in some of the best places in Great Britain, coming to this country some twenty years ago.

Everything done by Mr. Hayes in his compact little place is done well. No nook or corner is wasted; here and there are found a stephanotes, a rhyncospermum, a bougainvillea, a clerodendron, etc., and which are useful and most profitable for floral design work, of which he has an excellent trade both at home and from the surrounding country. He told me that he was going in for that grand gem, the eucharis, something every florist that does a retail business ought to grow.

The photograph shows Mr. Hayes' wife and daughter and two sons; his wife, an excellent lady, is of great help, making up all design work, and an excellent hand at selling, while his daughter attends to the store in the city, a charming, refined young lady, with a natural taste and love for flowers. The old man—for such I call him, as the black whiskers are getting streaked with gray—is as good as they make them; in fact, a truer and more honorable man never lived. Everything about the place does him credit and shows unmistakable evidence of refinement and prosperity S.

OUR LONDON LETTER.

[From a London Correspondent.]

A Pink Flowered Rambler Rose.

I think that the new rose named Psyche, shown by Messrs. Paul & Son lately at the meeting of the Royal Horticultural Society and certificated, will prove a pretty companion to the well-known Crimson Rambler, as it is the result of a cross between this variety and a rose introduced by the late Henry Bennett, named Golden Fairy. The plants were, of course, from under glass, but we noticed the same free clusters of from 15 to 25 flowers, so conspicuous in Crimson Rambler, only in the hybrid the color is tender rose, with exquisite little buds of a deeper shade. These should be welcome for boutonnieres. If Psyche proves as vigorous and free in the open garden as Crimson Rambler, we shall thank Messrs. Paul warmly for its introduction.

A Big Primrose.

One of the largest forms of the common primrose I have seen is named Evelyn Arkwright, and raised by Mr. J. H. Arkwright, Hampton Court, Leominster. From what I can see, it well retains its character, as the leafage is remarkably robust. The flowers are produced on a long stalk, clear yellow and fully two inches across.

Deutzia Parviflora.

This is a shrub I advise everyone to get who wishes to vary the flowers of the greenhouse early in the year. It seems to respond well to artificial warmth. The flowers are of purest white and borne in neat clusters. It has not long been introduced from China, being sent to the Imperial Botanic Garden at St. Petersburg, then to your Arnold Arboretum. It was first put into commerce in Europe through Prof. Sargent, who sent roots of it to Lemoine, of Nancy, France. It blooms very early, and is in every way a pretty dwarf shrub. The Royal Horticultural Society did well to certificate it. D. Lemoinei is a hybrid between D. gracilis and D. parviflora, and a very beautiful shrub, also with white flower clusters.

I notice that a new yellow arum is praised for the size of its spathes, but one wants to know a novelty of this kind well, so often size occurs through high culture.

THE OMAHA CONVENTION.

Preparations are advancing smoothly, and if the low rates of fare which are confidently expected should materialize, there is no reason why the Omaha meeting should not be the equal of any of its predecessors in interest and value. The local florists, although not primarily responsible for the selection of Omaha as the convention city, are fully aroused to the importance of the occasion, and will not be found lacking in those hospitable qualities that characterize the profession in all places and at all times. They look forward with keen anticipation to the approaching visit of their fellows from other sections of the country and are prepared to give a good account of themselves as generous hosts. A bowling club has been formed and a challenge to the expert bowlers of other cities is about to be issued. Eleven of the Omaha florists have become members of the national society since May 1.

The representatives of the executive committee of the S. A. F. found the ideal meeting place in the First Congregational church, which has been selected as the headquarters of the society. The audience room is a beautiful place, spacious and luxuriously furnished parlors and reception rooms are connected with it, and the basement, 48 by 72 feet, will accommodate a moderate sized exhibition nicely. A rear entrance on the same grade as the basement gives convenient access for exhibits, and there are plenty of suitable tables at the disposal of the society. The church is on the corner of Nineteenth and Davenport streets, in one of the most attractive residential sections of the city, and conveniently reached from all points.

Manufacturers and dealers in florists' requisites and equipments, in the large eastern cities, will make a great mistake if they do not take full advantage of this opportunity to get into communication with a new clientage. Many florists will be present on this occasion who have never heretofore visited a trade exhibition or had an opportunity to examine the latest devices and improvements in greenhouse appliances, and a valuable trade is bound to come to those who make the effort to open up this new and rapidly developing market for their goods. It is safe to assume that no previous convention has been favored with a more deeply interested and interesting local attendance than that of next August.

The matter of railroad rates is still under consideration, and there is good reason to expect that in a few days it will be possible to announce the most favorable terms ever granted to the S. A. F. for its convention. The railroad officials, as well as the managers of the great Trans-Mississippi Exposition understand that upon a liberal policy in the matter of transportation will depend much of the success of the undertaking, and they will, without doubt, see that everything is done that can possibly be done to insure a large attendance. S.

Greenhouses and Residence of Mr. James Hayes, Topeka, Kansas.

CHICAGO.

The Market.

The market is in a badly demoralized condition. The very warm weather has brought in a heavy supply, and in but few cases are sales at all satisfactory. All the dealers agree that the city trade is practically dead, and only a few note a satisfactory shipping trade. Prices are most anything. "What a man can get for his money depends upon his strength to carry it away and the size of the door," is the way one dealer puts it. His description of trade is "punky," which he explains means "rotten and slow."

While some very good stock is seen the great bulk seems to be soft and off in quality, undoubtedly due largely to the weather, but one dealer holds that the grower is also a factor. That where he knows a glut is on he is apt to be careless in the cutting of his stock, which is a mistake, for in a glut quality counts larger than ever, as the best stock finds first sale. The dealer naturally fills his shipping orders with the best stock he has, and often he will sort over 500 roses to pick out 50 good ones for a shipping order. As to grade, when stock is scarce probably 70 per cent. of a lot will be passed as first grade, while in case of a glut possibly not more than 20 per cent. will pass as first, the selection being more critical.

All look forward to Decoration Day to relieve present conditions. Prices will be moderate, and unless the present heated term shall have exhausted the present crop, the supply will be ample.

Club Meeting.

At the last meeting of the Florists' Club the subject for discussion was "Sweet Peas and Plants for Summer Flowers." A report will be found elsewhere in this issue. Chas. Schweigert and Eugene C. Louney were elected members of the club.

There was some discussion of plans for the summer. A suggestion of an excursion by boat to Milwaukee seemed to meet with favor, and Mr. C. C. Pollworth, of that city, who was present, said that the firm of Ellis & Pollworth would do all in their power to make the visit of the club a pleasant one should the members decide to make the trip. Final action as to the summer program will be taken at the next meeting, Friday, June 3.

J. Austin Shaw and J. E. Killen, of New York, were also visitors, and both favored the club with brief reviews of the business situation as they had found it on the road. Mr. Shaw evidently feared that some greenfly

might be present, and brought a box of cigars along as a precaution.

Various Items.

Ned Washburn is doing well, and it is expected that the injury to his hand will not prove serious.

Flint Kennicott has taken up his summer quarters at "The Grove."

The display of floral arrangements at the funeral of the late Police Inspector M. J. Schaack last Sunday was one of the most elaborate ever seen in this city. Four of the largest pieces were placed on a large float and occupied a prominent place in the funeral cortege. These pieces included a patrol wagon, five feet high, an inspector's star, five feet from tip to tip, and a huge floral clock.

Bassett & Washburn have issued a card giving sizes and prices of ribbon, and attached to same are samples of two qualities of ribbon they supply. They are also sending out some very pretty advertising matter in the shape of a blotter, in the center of which are the stars and stripes in colors and embossed, surrounded by a circle of gilt stars.

The father of John Muno died last Thursday, and was laid at rest Saturday.

Bowling.

There were some hot games at the alleys last Friday evening after the club meeting. The highest single score was 186, by Ed. Winterson, who also had the high average. Following are the scores and averages:

	1st	2nd	3rd	Av.
E. Winterson	167	186	146	166
R. Schenk	166	128	...	147
C. Held	136	156	118	137
G. Stollery	144	128	...	136
G. L. Grant	154	127	123	134
P. J. Hauswirth	103	137	137	128
C. W. McKellar	120	138	120	126

Another series will be played at the alleys at 77 Randolph street tomorrow (Friday) evening.

Among the Growers.

Reinberg Bros. are adding eleven new houses to their already immense range of glass at Summerdale. Of these houses six are being built by Peter Reinberg, each 25x265, and five by Geo. Reinberg, each 25x300. George will also rebuild quite a number of his old houses this summer. In wandering around the eight acres of surface covered by glass in Peter Reinberg's range, the foreman, Geo. Collins, as guide, to prevent our being lost, we noted a climbing sport from Bridesmaid that promises to be useful. The flower is the typical Bridesmaid, but the habit indicates a vigorous climber. On this place there are growing on the benches about 80,000 rose plants. Fourteen large boilers supply the heat and there is a force of twenty-five men. The roses grown are the standard market varieties and they are not trying anything new. In carnations they are increasing their stock of Flora Hill and Jubilee and will try Argyle, Evelina and Painted Lady. They still retain McGowan and Alaska.

At Bowmanville Herman Bauske is keeping up his reputation as a first class rose grower. In one of his benches is as fine a lot of young American Beauties as the writer ever saw, and Herman admits he never had them better. He is adding five new houses each 21x250, and the young stock will have an opportunity to do its prettiest in these new houses.

Otto Ristow seems to be resting on his laurels and has made no recent additions. He speaks longingly of the old days when prices kept a better average and when he used to cut from 1,000 to 1,500 Beauties a day and all sold quick at fancy prices. He keeps the old range going but don't feel like branching out under present market conditions. A leaf-roller has been causing some damage in his rose houses.

Magnuson & Pearson have the old A. T. Jackson place and their stock looks well considering the condition of the houses, one of which was partly crushed in last winter by a heavy fall of snow. They are growing mushrooms quite extensively and have found them rather more profitable than roses. In one bench was seen a lot of asters planted out, from which they expect to cut flowers in late July or early August.

The newer A. T. Jackson place is now conducted by Johnson & Carlson and the place shows the careful personal attention of the members of the firm. They are thinking of dropping the Meteor, though, as they can not arrange to give it the extra heat it needs to do well in winter. A lot of callas planted out in beds are producing a great number of flowers.

It seemed curious to look into the greenhouses of A. V. Jackson and find them devoted mainly to roses. In the old days the two Jacksons were the largest growers of carnations for the Chicago market, and both developed fat bank accounts from their crops of these flowers.

J. A. Budlong has certainly come rapidly to the front as a rose grower. The stock looks well all through and his young stock is in extra fine condition. Evidently Mr. Budlong can grow roses as well as ride the bicycle and he is an expert at the latter, having taken several little trips from Chicago to Boston and back on his wheel. He contemplates the erection of a new Beauty house 400 feet long in the near future. His son, A. H. Budlong, is actively associated in the business.

OMAHA, NEB.

On May 12 we had the pleasure of meeting and entertaining the President and Secretary of the Society of American Florists who remained with us three days. They were here for the purpose of making the final arrangements for the next convention of the national society in this city in August. The question of a hall in which to hold the meetings was at once taken up and the one finally secured was the annex to one of our leading churches, a building of two stories. The upper part is to be used for the sessions and the lower for the trade exhibit.

As our visitors arrived upon the date for the regular monthly meeting of our local club, Mr. Donaghue, the Vice-president of the S. A. F., invited them to attend and they were introduced to the members of the club of whom there were quite a number present. Both the visitors favored us with very interesting and instructive addresses, giving us some very useful hints as to the way to make the coming meeting of the national society a success.

After the meeting the florists gave the visitors a banquet, which was well attended and much enjoyed by all. Enthusiastic speeches were made by President Gude and Secretary Stewart and several others. All were surprised and delighted when Mr. Stewart favored the party with that beautiful song Annie Laurie accompanied by the orchestra. In response to repeated calls he responded graciously with one of his favorites which completely captivated his hearers and which will not soon be forgotten.

On Friday we visited the florists of Council Bluffs, as well as those of this city, and the visitors were also taken to the grounds of the Trans-Mississippi Exposition. They spoke very highly of the magnificent grounds and buildings. Saturday being a rainy day the proposed trip to Plattsmouth, Neb., had to be given up and instead visits were made to the most important public buildings of this city. The time spent in bowling in the afternoon proved that our visitors were no strangers to that amusement. When they left on the evening train for their respective homes it was with the good wishes of all and the hope that we would meet them again in August with numerous others, all of whom will be cordially welcome to the convention. J. J. H.

ST. LOUIS.

Stock—Prices.

The cut flower trade in this city has been very light the past week, and only for a few funeral orders, would have been called very dull. Prices on all kinds of stock are tending downward. Flowers have been abundant during the week and of extremely poor quality, owing to the warm and rainy weather.

Roses of all kinds are cheap; the very best can be bought at $3; others at from 50 cents to $1. A great many are badly mildewed and cannot be sold at any price.

Carnations are lower in price just now than at any time during the season, and are coming in every morning

in large quantities; most of them of poor quality. The reds are selling at 50 cents per 100; other colors at 75 cents and $1, and only the extra fancy bringing $1.50.

Paeonies are selling very low; price $2 and $3. Sweet peas are getting plentiful now. The price the latter part of the past week was 50 and 75 cents. Cape Jasmine are selling fairly well at $1 per 100. Mr. Brown, of Alvin, Tex., who is here in the interest of the Grand de Flora Jasmine and is making his headquarters at Kuehn's, reports orders for Decoration day coming in very satisfactorily.

We have plenty of ferns in the market now of the common variety (dagger), and the retailer is happy once more. Smilax is also selling fairly well, and plenty of it to be had at $15 per 100 strings.

Decoration Day Prospects.

A good Decoration day trade is looked for, and many inquiries for prices have been received at this date. Prices will not be advanced any if stock keeps coming in as it has been.

Notes.

Mr. and Mrs. J. M. Jordan will soon leave for Omaha to spend the summer with their son, Harry. Mr. Jordan has not enjoyed the best of health the past season and expects that the climate in that part of the country will do him a world of good. Speaking of the convention, Mr. Jordan says he expects to see a great many of his friends in August, and that every florist who can possibly spare the time should not fail to attend.

Mr. J. P. Gadd, formerly with C. Young & Sons Co., is now with Gus Eggling, the South Grand avenue florist. Mr. Eggling reports that next month he has a wedding to furnish that will equal the famous Busch affair in size. Gus also reports business good, and that he will build two new houses this summer.

The St. Louis Cut Flower Co. reports through Mr. Frank Ellis that business has been good with them all through the season.

We read in the last issue of the Review that the convention at Omaha will be held in the First Presbyterian Church. This should be very gratifying to a great many of the florists who only see the inside of a church when a decoration has to be made; but Sunday is generally a busy day with us.

President Halstedt, of the Florist Club, would like to hear from every florist who expects to attend the convention by the next meeting of the club, June 9. Those who are not members of the club and wish to go can address A. S. Halstedt, Belleville, Ill.

The question that will come up at the next club meeting will be, "Shall we have a picnic this year in the city, or shall we wait and have it at Omaha during the convention of the S. A. F.?"

John Young, of C. Young & Sons Co., reports a slick swindling trick played on them last week. The fellow called at their store and wanted the loan of four large palms for a customer of theirs, to be returned the next morning. He also had an express wagon, as the lady was in a hurry for them. The plants never came back, and the customer knew nothing about them. John gives this information for the benefit of his fellow craftsmen, who may receive a call from this same fellow.

Fred Ostertag has returned to the city and is now in the employ of Ostertag Bros.

The bowlers rolled five games of cocked hat Monday night. Kuehn was high man with 189; Beneke, second, with 179; Fillmore, third, with 152. Kuehn was 51 in a single game; Beneke, 50, and Fillmore, 45. Next Monday night will end the cocked hat series and then we get down to business at the regular old game of ten pins.

J. J. B.

NEW YORK.

The Wholesale Trade.

Business and news are at low ebb this week. If it rains (and we have had more than our share the last few months), trade is indifferent, and if the weather is fine, more stock comes in than there is possibly any call for, and so that is how it goes. There are no settled values; prices are as mythical and as hard to locate as the Spanish fleet.

Thousands of roses are coming into the market and prices are as low as $5 per 1,000, and hard to sell at that. Other stock it is almost impossible to quote. Prices are as variable as the moon's changes, and depend a good deal on the other fellow.

Decoration day, while it may have the effect of improving prices somewhat in other cities, in New York there will be very little material change, as the shipping trade will not be on a very extensive scale.

Retail Trade.

From some sources this appears to be better at this time than former years. While some decry and say war is at the bottom of the present dullness, others say it has been the means of keeping people in the city, leaving the country as they usually do at this time for Europe. At the same time, while there are a good many weddings taking place, it seems evident that social life is laying low, as they do not care to incur the suspicion of the masses that they are unpatriotic by too many social foibles and society events.

Various Items.

Many expressions of regret are heard and expressed on all sides at the death of Mr. Thomas Cartledge, of Philadelphia. He was well known here and had many friends, who will miss his friendly grip of the hand and welcome speech. "Requiescat in pace."

Mr. Arthur T. Boddington, of the firm of Clucas & Boddington Co., and Mr. Alfred Dimmock, of St. Albans, England, and representing Sander & Co., have both returned from their far western trip, and were surprised to learn that this country was at war with Spain. However, they came home weighted down with orders and patriotism, and say they are willing to enlist—their sympathies—at any time to fight the dons. Mr. Boddington's father, though an Englishman, was in the navy during the rebellion, and being the son of his father, he is willing to shoulder a musket and go and do likewise. Well done, Arthur; you are a chip off the old block.

One of the events of the week is the sale by auction of a collection of plants from Louis Menand, of Albany, N. Y., by Cleary & Co., and some sensational prices are anticipated.

Seed Trade.

Stumpp & Walter Co. report an excellent counter trade, and a big call for their Russian lily of the valley. They expect to do quite a trade in plants Decoration day, and are laying in quite a stock of this class of goods.

BOSTON.

Review of the Market.

The past week continued very dull in all branches of the business, and prices are still lower on everything with perhaps the exception of red roses, which are not over plenty, and sell well. Beauties bring about the same price as last week, while Brunners and Jacks range from $1.00 to $3.00 per dozen. Brides and Brides maids are sticky, and one can buy an excellent rose for 6 cents, but the average are sold at prices ranging from $1.00 to $4.00 per hundred.

Carnations are coming in very freely, whites being in better demand than colors; while all grades are moving slow, at from $1.00 to $2.00 per 100, high grades have reduced somewhat in quality owing to warmer weather, and $3.00 per 100 is an outside price for most all varieties.

Violets are done for the season, but there is plenty of valley, which is selling fairly well at $3.00 per 100 for good quality. Lilies are still in sufficient quantity for the demand and bid fair to be in good supply for Decoration Day; $1.00 per dozen is the ruling price. Sweet Peas have dropped to 50 cents per 100. Out door Tulips sell from $2.00 to $3.00 per 100.

Outlook for Decoration Day.

Decoration Day is now anxiously looked forward to, by both growers and dealers, with the prospect for everybody doing a rushing business. The present war will create a strong patriotic feeling, which will serve as an impetus to trade, which will be very acceptable to the craft. The season here is about ten days behind, so there will probably be a larger proportion of out-of-door flowers than usual. Lilac and late

tulips will be in in great quantity, helped out by other shrubs and bulb stocks and spiraeas, while carnations white flowers from inside, such as stock and spiraeas, while carnations and roses will in all probability be in sufficient supply. Orders are being booked by dealers to about the same extent as last year.

Plant Trade.

The plant peddlers are now very much in evidence and seem to be doing a good business. The wholesale price of geraniums has been reduced from $7.00 to $6.00 per 100, which is also the prevailing price at the auction rooms; choice stock will bring from $8.00 to $12.00. All kinds of plants are still selling rather slow, but with the outlook very bright for Decoration week.

The Weekly Exhibition.

The exhibition this week was devoted to primulas and hardy perennials but with small exhibits of both. Mr. Oakes Ames, of No. Easton, was the only one to receive a prize, obtaining second on primulas. Among other exhibitors A. W. Blake showed a collection of Azalea indica, receiving a gratuity. Rea Bros. were the only exhibitors of strictly herbaceous plants, also receiving a gratuity. C. H. Souther showed cut blooms of gloxinias while Mrs. Richards, Mrs. E. M. Gill and James Comley made their usual exhibits of seasonable native and cultivated flowers.

J. S. Bailey exhibited a nice collection of orchids, including an elegantly grown specimen of Miltonia vexillaria which was in a 4-inch pot. It had four spikes of bloom containing sixteen florets; awarded a first-class certificate. A couple of young cocoanut palms, showing mode of growth from the seed with a section of the bloom, which came from Jamaica, was exhibited by Miss Gertrude Kent, and attracted considerable attention. W. W. Tailby & Son exhibited a vase of their new carnation Harvard, a promising crimson variety.

News Items.

Dave Carmichael of Wellesley leaves on June 3d for a two months trip to the old country.

The Horticultural Society and others will petition the "City Fathers" to erect a building on the Public Gardens, to be devoted entirely to horticulture.

W. W. Edgar of Waverly is building a new house 20x110.

W. W. Tailby had some of his new carnations Harvard on exhibition at the market on Saturday.

Mr. W. J. Stewart is back from his Omaha trip. P

PHILADELPHIA.

Death of Thos. Cartledge.

It was with feelings of deep sadness that the florists of this city learned of the death of Thomas Cartledge, which occurred on Tuesday evening, May 17. Mr. Cartledge had endeared himself to all who knew him, and many there are who feel that they have lost their best friend. The Florists' Club called a special meeting for the following day, at which resolutions were passed, as follows:

Whereas, The Florists' Club of Philadelphia having learned with deep regret of the death of Thomas Cartledge, its late treasurer and honored member; therefore, be it

Resolved, That the Florists' Club of Philadelphia hereby expresses its deep sense of the irreparable loss it has sustained in common with a host of sincere friends; they were proud to have known him, to have associated with him, and to have called him friend; a man just, honorable and true in every position to which he was called. His memory will long be kept green in the hearts of the many to whom he was always a wise, sympathetic and affectionate counsellor. The Florists' Club, to whom he was long a faithful and efficient treasurer, and of which he was one of the founders, is unable to fully express the sense of great loss sustained by his death.

Resolved, That these resolutions be spread on the minutes of the club and a copy be sent to the family.

ROBERT CRAIG,
CHAS. D. BALL,
EDWIN LONSDALE,
Committee.

On the next day, Thursday, the Pennsylvania Horticultural Society took similar action.

The funeral took place on Saturday and was attended by a thoroughly representative body of men—florists, commission men, growers, seedsmen, supply men, Masons, Odd Fellows, Grand Army men, neighbors, friends and relatives—all were there to offer their last tribute of respect to the good man who had finished his life work. The story of his life is a bright example by which each one of us may learn how to lead nobler and better lives.

The Market.

The week was a very active one to the bedding plant men. Prices excellent. Should the present week prove as busy, there is good reason to believe that nearly all stock in bloom will be cleaned up by Decoration day.

The cut flower market has fallen off somewhat. Prices are a little lower and there is more stock wasted than last week.

I would like to add that in quoting prices heretofore, I have endeavored to give the ayerage prices for good grades of stock and not the extreme prices, which are only realized occasionally.

Penn. Hort. Society.

The Pennsylvania Horticultural Society's meeting on Tuesday evening brought out some good calceolarias and two rare orchids, both Laelia purpurata, but different varieties. The exhibitors, W. A. Manda, South Orange, N. J., and H. T. Clinkaberry, Trenton, N. J., each received a silver medal. Mr. Manda also received a certificate of merit for the extraordinarily large number of blooms borne by his variety of Laelia purpurata. John Thatcher carried off the calceolaria prize; John Hobson and C. W. Brown showing good stock. John McCleary took the cauliflower prizes.

Guaranteed Lilies.

The advocates of guaranteed lilies, or the getting-what-you-pay-for men, are encouraged by one of the importers having offered to guarantee one-half the cost of fifteen thousand Lilium longiflorums. This stock has been sold. The Bermuda grower made the offer because he was growing these bulbs, his entire stock, on land not before used for this purpose, and felt confident no disease would appear. This is a step in the right direction, and it is earnestly hoped that our importers will induce more of the Bermuda growers to follow this example.

Notes.

Pennock Bros.' store was closed the latter part of last week out of respect to Mr. Cartledge. Many and beautiful were the flowers sent to the funeral of Mr. Cartledge. Mr. A. L. Pennock speaks in the most glowing terms of the abilities of his late partner.

We all sincerely mourn the loss of a friend. J. W. Y.

BUFFALO.

Premature Planting.

An early, rainy, and rather humid, spring has made people slightly premature in planting their garden and in spite of the unpleasantness which confronts us with another nation, there is every probability of all good stuff being wanted, especially able-bodied men and geraniums.

There has been rather a slow time in town since May the first, in spite of the very best quality of flowers being here, roses cannot be beat and carnations are the best in the country.

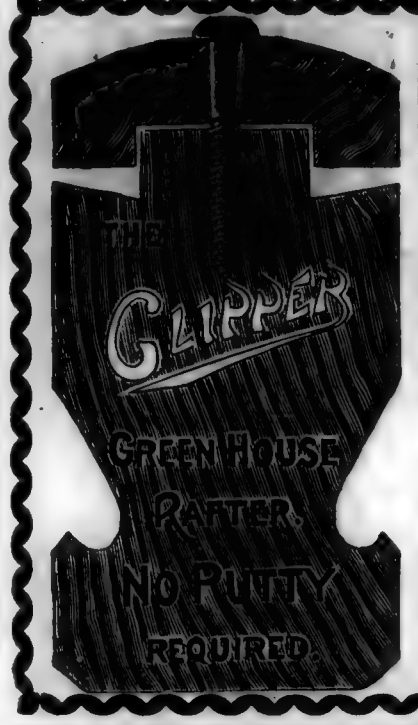
Visitors.

We were favored with a few visitors last week, among them Mr. Alex Galt Robinson of most genteel demeanor, who advocates the admirable use of the Rose Leaf Extract of Tobacco. Then Mr. Hulsebosch of Englewood, N. J., appeared, who advocates his own goods and Mr. Anderson who sells for Hiram Jones, of New Jersey. I have taken a solemn oath with the Editor of this journal that I shall never attempt another joke on the drummer, so I bid him good-bye. He has his uses perhaps, but he will never be noticed by me any more, and I extend him a cordial invitation never to call on me. When in Philadelphia a few weeks ago, I was told that the drummer joke was my stock in trade; most likely, but I have plenty of more better in reserve.

A Great Industry.

You are always finding out something and strange to say, within a mile of your correspondent's little farm

exists a great industry in our line. It is situated on the main road from Chicago to New York, which goes through Buffalo, via Rochester, Syracuse, Utica, Albany, and then to the great city. Well, a mile west of Corfu, lives Nelson Brown, a man who never knew or pretended to know anything about gardening, but in a few years he has cultivated pansies to such an extent that this year's shipment of pansy plants reached 100,000, or to give you a good idea he contracted with the American Express Co., for 20 tons of express weight; and they were all shipped in little baskets, 1 dozen pansies in each basket. Still more remarkable is the fact that the city of Rochester nearly took them all. Now don't all you seedsmen flood the man with letters, with the valuable information that you have the only pansy seed. He is going to take The Review, and will soon find out the best people. When a man spends fifty dollars a year for pansy seed he ought to have pansies.



A Marksman.

You know, Mr. Editor, that I never approve of too much of your columns being given to sport. The Review is a trade journal devoted to horticulture, not bowling or shooting, but pardon a few words about a man who really can shoot—not a George Anderson, who is liable to miss two birds out of twenty-five, but one who never misses. A few weeks ago the rather extensive houses and property of Mr. Thrall, of Jamestown, N. Y., were sold at sheriff's sale. The sheriff, as you know, always gives a good title. The purchaser was Mr. Bartlett. When he introduced himself he said: "I know nothing of the business; I have been in the gun business all my life." I little thought to whom I was talking, although I had seen him shoot. He is going to join our club and is going right into the business.

One of his feats with the Burgess repeating gun is to break six glass balls thrown in the air at once, and he breaks them all before they reach the ground. Another is to lay the gun on the ground, throw up two balls with his own hand, turn a handspring, pick up his gun and break both before they reach terra firma. I pity Darby Road, Chestnut Hill or Holmesburg. There are several men who could do the last trick, notably Peter Crowe, Burt Eddy or Edwin Lonsdale, excepting the handspring and breaking the balls. He is a clean cut, fine young man of exemplary habits, and in appearance much resembles C. D. Ball. It is Bartlett, the expert and trick shooter. W. S.

THE HARRISII DISEASE.

The experiments at Lincoln Park, Chicago, showing that Kraft's Plant Tonic will kill the mites that cause the Harrisii disease, have excited a great deal of interest. Indications are that the tonic will be largely used by growers of Harrisii lilies.

Butted Glass.

This is no longer an experiment, it has come to stay. There are various ways of making Butted Roofs, but the best way is with the

Clipper Bar.

With this bar you can make a roof that is absolutely free from drip, and glass cannot be torn out by the wind. Butted glass makes a tight roof, a warm house and saves fuel. It lasts longer, looks better and costs less than the old-fashioned roof. But do not think that this is the only bar we sell, for it is not; we furnish what people want and there is nothing in greenhouse material that you cannot get from us, and all of open-air-dried Cypress clear of bright sap, stained sap, knots and all other defects.

LOUISVILLE, KY.

The "Louisville Florists' Supply and Exchange" will open June 1 at 620 Fourth avenue. It will be a commission house, with some unique features. All the consignments will be kept absolutely separate and the consignee notified of any unsold stock. The record will be kept so that sales can be accurately traced clear through. It is also announced that no sales will be made to fakirs. An establishment of this sort has long been needed here.

R. C.

ST. JOHNS, N. B.

H. S. Cruikshank devotes his whole plant to cutflowers, of which he seldom has a surplus. The bedding plant trade has, as in many other places, drifted into the hands of smaller growers who are content with less or no profit. For a city of its size our branch is poorly patronized, I should not wonder if Sol Smith Russell found material in such a place for his play "Peaceful Valley" so content are the natives with their surroundings.

BRATTLEBORO, VT.—C. E. Allen reports a good seed season which opened up well and the recent cool spell allowed him to catch up with orders. He issues a plant catalogue and carries a general line of stock to supply an old established clientage.

KALAMAZOO, MICH.—Joseph Dunkley, the well known florist, and the pioneer celery grower of this place, is seriously ill and his life is despaired of.

WANT ADVERTISEMENTS.

SITUATION WANTED—As foreman or grower by competent man. Best references. Married, no children. Address foreman, care of Florists' Review.

SITUATION WANTED—As private gardener, by thoroughly competent man with the highest references from last employer and others. Removal of employer only reason for change. Address K. X., care Florists' Review.

SITUATION WANTED—As head gardener in private place or public institution. English, 52, widower (one daughter, 25). Thorough horticulturist, fruits, flowers, vegetables, landscape and ornamental work; 4½ years in Golden Gate Park, one year head gardener in present place. Best of references. Address, stating wages, etc., G. M. Stratton, Dungeness, Cumberland Island, Fernandina, Fla.

SITUATION WANTED—As propagator of general greenhouse stock, by a florist that is a good worker and strictly temperate. Good references. Address F. A., care Florists' Review.

SITUATION WANTED—By all around florist on private or commercial place, married, good worker and total abstainer. Best of reference. Address A. R. W., Box 849, Stafford Springs, Conn.

WANTED—A first class grower who knows enough to run a place on business principles, if desired can take half interest in good paying retail business, state wages with or without board. Only capable florist needs to reply. Situation in the South. Address A. G., care Florists' Review.

FOR SALE—First class retail stand, about 5,000 feet of glass, new. Has never produced less than $1,300 per year, net. Will require $1,000 cash; balance, time at 6 per cent. Reason of selling, failing health. Address Illinois, care Florists' Review.

SITUATION WANTED—Good all around gardener and florist; married, no family. Private place preferred. State wages. H. H. Hunt, Evanston, Ill.

SITUATION WANTED—A young man, 20 years old, desires position in cut flower store or greenhouses; has six years experience; good maker-up; best of reference, also security. Address H. C. H., care of Florists' Review.

SITUATION WANTED—By an A1 grower of general greenhouse stock. Am 30 years old and single. If in need of a good man and are willing to pay fair wages, address M. K., care Florists' Review.

SITUATION WANTED—By an experienced gardener in landscape, nursery or pot flower cultivation; 25 years' experience. Only those willing to pay fair wages need reply. Address H. C., Florists' Review.

SITUATION WANTED—As foreman, good grower, single, age 30. Address N. T., Florists' Review.

FOR SALE—Four greenhouses, nearly new. Splendid retail stand in residence district on paved street leading to cemetery. Easy terms. Must retire on account of health. A. Claus, 501 N. 4th St., Springfield, Ill.

WANTED—By the 15th of June, a first-class all 'round florist to take charge of plant of 8,000 feet of glass. None but steady reliable man need apply. References. Wages $50 per month. Address X, care Florists' Review.

WANTED—A first-class grower who knows enough to run a place on business principles, to buy one-half interest and take full charge; must thoroughly understand the business. If dissatisfied with his purchase any time within one year he can have his money back. For particulars address A. H., care Florists' Review.

SITUATION WANTED—By expert grower of plants and cut flowers. Competent in every department. Seeks a situation where he may have a chance to make his services worth more than in his present place. Can surely advance his employer's interests if given suitable opportunity. Address S. D., care Florists' Review, Chicago.

CINCINNATI.

Dull is the word, and dull it is. We are having summer weather, summer business and summer prices; some are making expenses and some are not. There is plenty of choice stock to be had, with but little demand.

The May music festival begins tonight (Tuesday), which is quite an event in society, but the general opinion is that the demand for flowers will not amount to much.

The prospects for Decoration day are good, but should it equal our expectations, it cannot make up for the many dull days we have experienced. Last Saturday was Dewey day, and Cincinnatians celebrated the event in grand style. Quite a few flowers were used for decorative purposes, but the only ones that were strictly "in it" were the flag and bunting men.

Thursday, July 21, is the day set aside for our next annual outing. The majority of the boys are in favor of going to Coney Island, so of course Coney Island it will be, providing we can make satisfactory arrangements with the management.

Mr. B. P. Critchell, who has been confined to his house for several days with rheumatism, is now able to attend to his business.

Recent callers: George Headsworth, representing J. C. Vaughan, Chicago, and Martin Reukauf, representing H. Bayersdorfer & Co., Philadelphia.

B.

JADOO.

In the advertisement of the American Jadoo Co., on page 988 of this issue, appears a strong recommendation of Jadoo from Messrs. A. Blanc & Co., Philadelphia, who add: "We would not recommend Jadoo if we did not think it of benefit to the grower."

SALEM, MASS. — McGee, Geary & Co. are well prepared to handle the usual heavy business which falls to their share on the 30th.

MITCHELL, S. D.—Easter trade was more than double that of last year and prospects for spring trade are excellent. E. C. Newbury has just completed a new house. 20x60.

BANGOR, ME.

Adam Sekenger is the synonym for a successful member of the craft even as was our sire of remote memory. This Garden of Eden is most conveniently laid out with two entrances so that when a crush of visitors occur, as happened at time of my visit, there is no confusion and all can enjoy the frequent displays put forth. It is an excellent plan and has proved a great incentive to the business. The stock is well worth inspection.

Ground has been staked out for an additional range of houses and had I been a drummer for a glass house quoting low I would have booked a nice order, but as this commodity has advanced in price Mr. Sekenger will "Bide a wee" ere building. W. M.

BAR HARBOR, ME. — With the boom of cannon in the distance the craft are very pessimistic with regard to the season's business now approaching, basing their fears upon the facts that many owners of yachts will be absent. These constitute a large percentage of the cottagers and usually entertain lavishly. Let us hope things will turn out profitably to all.

HUNT'S REVIEW OF THE CHICAGO MARKET.

The past week will never be looked back upon with pleasure, either by the grower, the commission man or the retailer. As we heard one retailer put it, "July business with May stock." That may be correct from a retailer's standpoint, who buys only what is needed from day to day, but the commission men will say that it has been July business, with fully double the usual May supply.

Roses have come out in immense numbers. A few—possibly 10 per cent—bring a fair price, the balance go on offers. The buds are growing smaller, and some growers have a bad dose of mildew on their hands, and in competition with clean foliaged stock the mildewed article cannot be moved at any price.

In carnations good whites are selling well. Pink are a glut, reds are in general poor and not in much demand. Sweet peas move slowly, at constantly falling prices. Harrisii, though not numerous, are little sought for.

Out door stock is selling very poorly, not for years has it been so hard to work off flowers of this class.

We trust the present week will in a measure make up for the low average of the last three or four.

NOW in course of preparation, The Florists' Manual, by William Scott. It will cover the whole field of commercial floriculture, the articles arranged alphabetically, so that reference may be quick and easy. It will be a whole library in itself. Price only $5.00. Send in your order now to the Florists' Publishing Co., 530-535 Caxton building, Chicago.

WALLINGFORD, CONN.

Geo. H. Rowden does not claim to know it all, simply because he has had success with lilies this year especially, but the method he regularly adopts is worth relating. The bulbs are potted upon receipt into a 4½-inch pot with plenty of drainage (and, by the way, a little sand around the bulb as practiced by the old-time growers will be quite in order). The pots are given one good soaking, then placed in frames covered with shutters to keep off any additional moisture; when sprouted sash is substituted for shutters. The pots are kept in this stage until room can be found for them in the house, when the bulbs are shifted into the pots in which they are intended to bloom. The advantage of new soil benefits the plant, which no doubt is induced to grow better by this action. This is a desideratum, however, in most cases. W. M.

BROOKLINE, MASS.

F. E. Palmer cordially invites all skeptics to his houses, where can be seen roses, both grafted and on own roots, in the same house. Under such conditions only can comparison be made. In this case it is decidedly in favor of grafted stock. I never saw finer PapaGontiers; small wonder they sell so well; such exquisite color. In commenting upon the season, Mr. Palmer said it was the best he has yet seen.

Jas. Quinn speaks in a similar strain and is being rushed with spring business. Weddings and funerals have kept him busy for some time past.

Miss Vass notes as large demand as usual for Nephrolepis Bostoniensis. This lady was very fortunate with her lilies at Easter, proving that Japan bulbs can easily be brought into bloom with the necessary attention. W. M.

NEWBURYPORT, MASS.

E. W. Pearson carries his roses over the second season. He finds this method profitable, particularly with Woottons, which are exceptionally fine. Just now roses are plentiful, so the capital plan is adopted in giving a bloom to every purchaser of plants, a paying advertisement. Considerable addition will be given to space for palms, and a carnation house 125x16 is in course of erection. Four acres of fine soil is intended as a nursery to supply local demand.

Mr. Pearson's best man has left for the front, leaving behind as a legacy a fine lot of spring stock. W. M.

HILLSDALE FLORAL PARK,
Mention Florists' Review. HILLSDALE, MICH.

NORTHAMPTON, MASS.

The proverb, "All things come to him who waits," most aptly applies to H. W. Field, who has just been rewarded by a bargain in a three acre lot of land in the city limits and past which a new trolley line runs. Upon the corner lot, fac ng two stree s, three houses are being erected, two full span, 110x19 and 100x25 feet, respectively, and one three-quarter span, 110x19 and 100x25 feet, reso arranged as to provide for other houses in prospective. Sufficient top soil for a three years' planting is quite an item nowadays, when good soil is difficult to obtain. Mr. Field had a splendid Easter, converting his pretty store into a show house wherein the choice stock was arranged to tempting advantage by Miss Field.

I looked in on Mr. E. J. Canning, who, although a graduate of Kew, England, Philadelphia claims as one of her own, as it was in that hospitable city Mr. Canning first saw the light of this great and glorious country, and to what an enviable position has he attained since taking charge of the Botanic Garden attached to the Smiths Colleges here, which includes a class of one hundred and twenty-five sweet girl students of botany. Is it to be wondered at that the plants seem to bloom more perfectly under their influence as they flit from flower to flower like so many butterflies casting a delightful halo about them? Yet even in this garden of Eden the pesky insects will invade, but Mr. Canning holds them in check by the use of kerosene applied by spraying as fine as a Scotch mist; if applied any coarser, would injure the foliage. Palms, ferns of strong growth, and such foliage plants as crotons and the like, apparently benefit by the application.

Encouraged with the interest taken by the students in the classes, the faculty proposes making considerable additions to the glass section, and enlarge the class, which is filled to overflowing. Also to introduce zoology, so that with some other of the sciences Mr. Canning will be flooded with ologies.

The herbaceous section is most interesting and instructive. Here we have a striking illustration of American foresight, for most assuredly the majority, if not all, of these clever girls will at no very distant date be interested in homes of their own or of others, which must be surrounded with mementos of the lovely times they are now experiencing, and here is where the smart florist will get in his work and keep up-to-date, as illustrated by the aforementioned Mr. Field, who intends setting aside a big piece of ground as an herbaceous border. He says there are so many things really beautiful which can be handled to advantage during the summer season at a small outlay.

W. M.

We have a Fine Stock of the Leading..... **CANNAS** In fine shape for immediate bedding.

Florists' Review....

BALTIMORE.

Trade Review.

Trade the past week was a decided improvement over the unsettled condition of the week previous. Most all of the retailers reported a change for the better, and seemed more hopeful, now that the good weather has returned. In the wholesale market there is little or no change, except in quality, which has greatly improved. The supply and demand are about equal.

Hail Storm.

On the 16th inst. Baltimore and vicinity were visited by a severe hailstorm, which, although of short duration, did much damage to florists who were so unfortunate as to be located within its path. The storm was most severe in the southwestern section, and it was only in that district that heavy loss was sustained.

Samuel Feast & Sons suffered severely, having quite a large percent of their glass broken. Mr. Jno. Cook, Old Frederick Road, lost about 500 square feet. Mr. A. Stoll was also damaged to the extent of $50, while many others in that radius met with smaller losses.

Notes.

A very emblematic reminder of the times was seen this week in the windows of Mr. W. J. Halliday. Framed in a wreath of laurel, and draped in the folds of Old Glory, was an excellent portrait of Admiral Dewey. The extreme simplicity of the design added doubly to its patriotic effectiveness.

Saturday the 21st was flower day in Baltimore. The Massachusetts Sixth Regiment passed through our city, en route south, and was given a floral ovation. The city officials presented them with a handsome basket of flowers, tied with large bows of the national colors, the streamers of which bore in gold letters the following inscriptions: "Massachusetts and Maryland, May 21, '98." "Baltimore Welcomes the Sixth Regiment. Flowers Instead of Bullets." "God Bless You and Bring You Safely Home."

All along the line of march many thousand flowers were thrown at the soldier visitors, which act presented a striking contrast to the historic reception of bullets given this same regiment in 1861.

Mr. Samuel S. Pennock paid us a flying visit last week. C. F. F.

THE American Journal of Health prints in its issue of May 10 an editorial very warmly commending the "Excelsior Brand" of plant food manufactured by the Walker Fertilizer Co., Clifton Springs, N. Y. It prints this report as the result of extensive experiments with the plant food.

IF YOU want to buy you will find it to your advantage to buy of the advertisers in The Review. If you want to sell, you will find it to your advantage to advertise in The Review.

JADOO

(COPY) A. BLANC & CO.,
Offices, 314-316 N. Eleventh Street,
PHILADELPHIA, PA., March 15, 1898.

THE AMERICAN JADOO CO.

GENTLEMEN:—Mr. Craig's wonderful success in growing Crotons, Palms, Asparagus Sprengerii, and even Roses in **Jadoo** induced us to order a ton of you some time ago. We have used it with gratifying results on various plants and are so highly pleased with it that we wish you to send us another ton at once, as we have a lot of valuable new Cannas waiting for it now.

We have not used **Jadoo** as indiscriminately as others, and therefore, **we think our success with it can be attributed to careful judgment as to watering.**

As the material retains 200 per cent. more water than ordinary potting soil, the plants grown in it should and **must** be watered less frequently; the pots should also be of much smaller size. **In these two items alone the saving in labor and space is very great and fully covers the extra cost of material**

Seedlings of Asparagus Sprengeri do wonderfully well in it, even when grown in small paper pots (another saving of space), when repotting we use only one-half Jadoo and one-half soil—for Cannas we use one-third Jadoo—for fancy leaf Caladiums one-half soil and Jadoo. The latter grow vigorously in it and the colors are much brighter.

We would not recommend Jadoo if we did not think it of benefit to the grower. Yours very respectfully,
(Signed) A. BLANC & CO.

Send for our new printed matter.

The Model Extension Carnation Support

QUEENS, N. Y., Feb. 16, '97.
MR. THERON PARKER, Brooklyn, N.Y. Dear Sir:—I have tested your latest Model Carnation Support, and am free to say that I consider it the best wire carnation support that I have ever seen. It is quickly and easily applied, and I think will prove very durable, and you certainly deserve great credit for the invention.
Very truly yours,
G. W. WARD.

FLATBUSH, BROOKLYN, N. Y., Feb. 18, '97.
MR. THERON PARKER.
Dear Sir:—Your wire stake is certainly a gem. Without hesitating we endorse it as an up-to-date Carnation Support. Yours truly,
DAILLEDOUZE BROS.

W. HOBOKEN, N. J., Feb. 18, '97.
MR. THERON PARKER, Brooklyn, N. Y. Dear Sir:—It gives me much pleasure to congratulate you upon your success in getting up Carnation Supports. I think that those I have had from you are about as perfect as anybody will be able to make them. They certainly fill my bill for an ideal carnation support, a thing I have been looking for for a long time. Wishing you every success in the sale of them, I am,
Yours truly, E. ASMUS.

WE HAVE received from Prof. Wm. Trelease, director of the Missouri Botanical Garden, St. Louis, Mo., a copy of the ninth annual report of the garden. It is, as usual, handsomely illustrated, and full of very interesting botanical matter covering much original research. It is a valuable contribution to botanical literature and we take pleasure in complimenting Prof. Trelease on the excellent work being done at the Missouri Botanical Garden under his direction.

SEND IN your order now for a copy of The Florists' Manual, by William Scott. It will cover the whole field of commercial floriculture and will be the standard work of reference for the trade. Price $5.00.

Always mention the Florists' Review when writing advertisers.

GO-OPERATION

IF you are in the trade and are not yet a subscriber to the FLORISTS' REVIEW, send in your name and one dollar now and you will receive not only the FLORISTS' REVIEW for one year, but also a certificate entitling you to the earnings on one dollar's worth of stock in the Florists' Publishing Co.

Why do we make such an unparalleled offer? It is very simple.

You will have an interest in the success of the paper.

You will see that you can buy everything you want to just as good advantage from advertisers in the FLORISTS' REVIEW as elsewhere and at the same time benefit yourself by increasing the earning power of your certificate.

This mutual arrangement cannot fail to bring to the paper a heavy advertising patronage, and as a result the stock represented by your certificate will earn good dividends.

And the more you buy of advertisers in the FLORISTS' REVIEW (always mentioning the paper), the larger your dividends will be.

You get the best paper in the field and a share of its earnings.

Send in your subscription now.

NEW SECTIONAL HOT WATER HEATER.

Specially adapted to large ranges. Will heat up to 16,500 feet of glass. Highest economy. Moderate cost. Also heaters for smaller work. Send five cents postage to New York office for latest catalogue of Heating and Ventilating Apparatus. Estimates furnished for Cypress Greenhouse Material.

NEW YORK OFFICE: St. James Bldg., Broadway and 26th St.

GENERAL OFFICE AND WORKS: Irvington-on-Hudson, N. Y.

The Capacity Question

When different heaters of the same actual capacity are rated differently, something's wrong. At least one of the heaters is overrated. Won't do the work claimed for it. It'll mean a heater failure. Heating contractors know that the **"SPENCE" HOT WATER HEATER** and all of the heaters formerly made for the American Boiler Co., are not over-rated, that they have just the capacities the manufacturers say they have.
